London; but before he reached that city, he beheld the conflagration which deſtroyed ſo large a part of the metropolis of England. This tremendous ſcene would have appalled the ſtouteſt heart; to Mr. Gale it was peculiarly tremendous; the firſt tidings that reached his ears announced the deſtruction of the houſe and property of his beſt friend, and with theſe he had reaſon to fear the loſs of a deſk left in his hands containing all the MSS. which he had been ſo many years in accumulating. Scarcely had he reconciled his mind to the diſtreſſing event, when he met his friend, who aſſured him the deſk and contents were happily ſaved from the flames. He now reſolved to apply all his diligence in completing the work upon which he had already beſtowed ſo much time and labour; and, having finiſhed it, he applied to Dr. Fell, the vice-chancellor of Oxford, for a licence to print it. It was accordingly publiſhed at different periods; the firſt part came out in the year 1669, and was entitled, "The Court of the Gentiles; or, a Diſcourſe touching the Original of Human Literature, both Philology and Philoſophy, from the Scriptures and the Jewiſh Church." This ſpecimen was received with great applauſe both at home and in foreign countries: and Mr. Gale publiſhed the remaining parts in 1671 and 1677. The whole was ſpeedily tranſlated into the Latin language, and the fame of the author was extended over every part of Europe. Mr. Gale had publiſhed, in 1676, "Philoſophia Generalis, in duas partes, &c.;" the grand object of which was the ſame with that in "The Court of the Gentiles," but written in a more conciſe way, and intended for the uſe of perſons engaged in a regular courſe of philoſophical ſtudies. In the beginning of the year 1678, he printed propoſals for publiſhing, by ſubſcription, "Lexicon Græci Teſtamenti Etymologicum, Synonymum ſive Gloſſarium et Homonymum," which was intended as a lexicon and a concordance. The author had made conſiderable progreſs in the work, which was to have been compriſed in one volume folio, when Death ſtopped his career: this happened in 1678, when he was only in the 50th year of his age. Mr. Gale was a man of great learning, talents, and induſtry, his manners were mild and inoffenſive, his moral conduct irreproachable, and his piety towards his maker ardent and cheerful. He was zealouſly attached to what he thought the truth; ſteady in his adherence to the principles of non-conformity; and, having abandoned worldly good and temporal advantages, at the call of his conſcience, he was at all times ready to vindicate his conduct, and give a reaſon of the hope that was in him. He was author of many other works beſide thoſe already noticed. Theſe are enumerated in the Biographia Britannica, to which the reader is referred for further information.

GALE, THOMAS, was born at Scruton, in Yorkſhire, about the year 1635, and was educated in Weſtminſter ſchool. From Weſtminſter he went to Trinity college, Cambridge; where he took his degrees, and of which college he afterwards became a fellow. He was diſtinguiſhed by his exact knowledge of the Greek language, of which he was appointed the Regius Profeſſor. In 1672 he was choſen head maſter of St. Paul's ſchool, and was employed to write the inſcriptions on the monument, erected in memory of the dreadful conflagration in 1666; for which he was preſented with a piece of plate. In 1676 he was collated to a prebend in the cathedral church of St. Paul's, and about the ſame time he was choſen a fellow of the Royal Society, to which he preſented a Roman urn with its aſhes; and about the year 1697 he gave the library of Trinity college a great number of curious Arabic MSS. Having continued 25 years head maſter of St. Paul's ſchool, he was, as a reward for his great merit and inceſſant induſtry in that laborious occupation, promoted to the deanery of York. He died April 8, 1702, in the 68th year of his age, highly reſpected by all who knew him. He was a learned divine, a great hiſtorian and antiquary, and one of the beſt Grecians of his age. He was not only eſteemed by his own countrymen, but kept up a valuable correſpondence with many of the moſt learned men in foreign countries. He publiſhed new editions of various learned works, and likewiſe two volumes in folio of our ancient Engliſh hiſtorians. Biog. Brit.

GALE, ROGER, ſon of the former, a learned antiquarian, was born in 1672, and educated at Trinity college, Cambridge, of which he became fellow in 1697. He was repreſentative of North Allerton, in Yorkſhire, during three parliaments, and he held the office of commiſſioner of the exciſe. He was a fellow of the Royal and Antiquarian Societies, and of the laſt he was vice-preſident and treaſurer. He publiſhed "Antonini Iter Britanniarum Commentariis illuſtratum Thomæ Gale, S. T. P. nuper Decani Ebor Opus poſthumum reviſit, auxit, edidit R. G. Acceſſit Anonymi Ravennatis Britanniæ Chorographia." In the preface to this work, he pointed out what was his father's and what was his own in this edition. Mr. Gale likewiſe publiſhed a work entitled "The Knowledge of Medals," &c. tranſlated from the French of Joubert; "Regiſtrum Honoris de Richmond;" "A Diſcourſe on the four Roman Ways in Britain," and ſeveral papers in the Tranſactions of the Royal and Antiquarian Societies. He bequeathed his MSS. and a cabinet of Roman coins to Trinity college, Cambridge. His brother Samuel publiſhed "The Hiſtory and Antiquities of the Cathedral Church of Wincheſter," which was begun by Henry earl of Clarendon, and continued to the year 1715. Biog. Brit.

GALE, JOHN, born in London in the year 1680, was inſtructed with great care in the learned languages, and in Hebrew, in which he had made a very conſiderable proficiency by the time that he was ſeventeen years of age. At this period he was ſent by his father to the univerſity at Leyden, where his progreſs was ſo great that in leſs than two years he took the degrees of M.A. and doctor of philoſophy. From Leyden Dr. Gale went to Amſterdam, where he purſued his theological ſtudies with great ardour, and having carefully improved himſelf in the knowledge of the Oriental languages, he undertook a critical examination of the Old and New Teſtament in their originals. So great was his reputation for real learning, that the univerſity of Leyden offered him the degree of doctor in divinity, provided he would ſubſcribe to the articles eſtabliſhed by the ſynod of Dort. But he rejected the propoſal, being reſolved never to ſacrifice his liberty for worldly profit or literary honours, and to call none maſter on earth but Chriſt. Dr. Gale had been educated in the principles of the antipædobaptiſts, and in 1705 he was called upon by his friends to juſtify his ſentiments, by anſwering "The Hiſtory of Infant Baptiſm," publiſhed by Mr. Wall, vicar of Shoreham, which hiſtory had been honoured by a vote of thanks of the Houſe of Convocation. He accordingly drew up a ſeries of letters on the ſubject, which were publiſhed in the year 1711, under the title of "Reflections on Mr. Wall's Hiſtory of Infant Baptiſm, in ſeveral Letters to a Friend." In the courſe of theſe letters he vindicated his friend Le Clerc from the imputations of hereſy and impiety caſt on him by Wall and others, on account of his unwillingneſs to admit any human explanation of the doctrine of the Trinity as an article of Chriſtian faith. Dr. Gale, on account of his extreme modeſty, could not be prevailed on to undertake the paſtoral office till he was thirty-five years of age. He then ſettled

with a congregation of baptiſts near Barbican, where he ſoon became a very popular preacher. His doctrines were liberal and ſcriptural, but he thought, that though the ſacred writings were alone authoritative in matters of faith and practice, yet that an accurate acquaintance with the doctrines and diſcipline of the church, in the ages next the apoſtles, was highly deſirable, as affording a view of the ſenſe in which the ſacred writings were then underſtood; with this view he became a member of a ſociety for promoting primitive Chriſtianity, which met weekly at Mr. Whiſton's, for the purpoſe of examining the moſt ancient writers of the Chriſtian church, to determine which of the pieces attributed to them were, and which were not genuine. On all occaſions Dr. Gale proved himſelf a zealous friend to the object of theſe meetings, and exhibited an ardent deſire of diving into the truth: nor was he leſs anxious to extinguiſh all diſputes among Chriſtians. In 1719 a furious controverſy was excited among the diſſenters in the weſt of England, on the ſubject of the Trinity, and reſpecting ſubſcriptions to teſts of orthodoxy: the London miniſters were not neutral in the conteſt; many of them, to their diſgrace, ſanctioned the proceedings of the bigotted, intemperate, and perſecuting party; but Dr. Gale, than whom no one was more reſpectable, was of the majority who ſubſcribed an advice to their brethren in the country not to impoſe unſcriptural ſubſcriptions, in oppoſition to thoſe who ſubſcribed a contrary letter on that ſubject. Dr. Gale's "Reflections on Mr. Wall's Hiſtory" produced an interview between the authors, at Mr. Whiſton's, where the ſubject was diſcuſſed at large, but both parties retired more fully perſuaded that their own doctrines were thoſe of the truth. Mr. Wall drew up a vindication of his "Hiſtory" and opinions, which obtained for him a diploma from the univerſity of Oxford. Dr. Gale ſet about preparing an anſwer to his antagoniſt, but long before it was ready the world was deprived of the benefit of his exertions in the cauſe of religious liberty by his premature death. This event happened in the year 1721, when the doctor was only in the forty-ſecond year of his age. He had, however, lived long enough to attach the friendſhip of many of the moſt eminent characters of the age, and to obtain, on account of the benevolence of his diſpoſition and the mildneſs of his manners, the general reſpect and eſteem of all who knew him. Among his particular friends may be mentioned the lord chancellor King; Dr. Hoadly, biſhop of Bangor, and Dr. Bradford, biſhop of Rocheſter. This worthy man, according to the uſual courſe of events, might naturally have looked to a much farther extenſion of life, and had accordingly projected many valuable deſigns, of which one was an "Engliſh Tranſlation of the Septuagint," according to the edition of Dr. Grabe; and another was "A Hiſtory of the notion of Original Sin," in which he meant to ſhew its total inconſiſtency with juſt and honourable conceptions of an infinitely wiſe and good being. Soon after his death four volumes of his "Sermons" were publiſhed which were diſtinguiſhed by the utility and importance of their ſubjects, and by the ſtrength and clearneſs of the reaſoning contained in them. Biog. Brit.

Gale, or *Gaule*, in *Botany*, a name of Dutch origin applied to the Candleberry Myrtle, *Myrica Gale* of Linnæus. See Myrica.

Gale, in *Geography*, a river of Ireland, in the northern part of the county of Kerry, which flows into the Caſhin.

Gale, in *Rural Economy*, a term ſignifying a bull that has been caſtrated.

Gale, a *Sea Phraſe*, for the blowing of the wind.

When the ſea is not blown ſo hard, but that a ſhip can carry her top-ſails a trip, that is, hoiſted up to the higheſt, they ſay it is a *loom gale*.

When it blows very ſtrong, they ſay it is a *ſtiff gale*, or at leaſt a *freſh gale*; but when it blows ſo hard, and violently, that a ſhip cannot bear any ſail, they ſay it blows a *ſtorm*.

When two ſhips are near one another at ſea, and there being but little wind blowing, one feels more of it than another; they ſay the ſhip *gales* away from the other.

Gale's *Creek*, in *Geography*, a river of North Carolina, which runs into the Atlantic. N. lat. 34° 44'. W. long. 77 12.

GALEA, or Galerus, among the *Romans*, was a light caſque for the head, generally made of the ſkin of ſome wild beaſt, in order to appear the more terrible. Thus Virgil.

"—— fulvoſque lupi de pelle galleros."

The galea was alſo a head-piece, coming down to the ſhoulders, commonly of braſs, and ſometimes of iron; the lower part was called *buccula*, and on the top was the creſt.

Galea, in *Natural Hiſtory*, the name of a genus of the *echinodermata*, or ſea-hedgehogs, whoſe ſhape is that of a large elevated helmet, compoſed of ſeveral tranſverſely-joined plates, or aſſulæ, and covered with very ſmall and rough tubercles, in the ſhape of little granulæ. This genus, when foſſile, is called in Engliſh the helmet-ſtone, and is marked with ten rows of double lines, either crenated, or punctuated, and running from the top to the baſe; the anterior ones being much longer than the reſt.

Of this genus there are three known ſpecies, *viz.* 1. The ſcutated headed one, which has on its ſummit an oblong pentagonal plate like a ſhield. 2. The naked headed one without this ſhield. 3. That with the tæniæ laurated, and ſhewing that they have been once of the variolated kind. Klein's Echinod.

Galea, or *Galiot*, in *Naval Tactics*, a low built veſſel for the conveyance of troops or ſtores, having both ſails and oars.

Galea, in *Surgery*, ſignifies a kind of bandage for the head.

GALEACHABAD, in *Geography*, a town of Hindooſtan, in Allahabad; 3 miles N.W. of Iconpour.

GALEAPOUR, a town of Bengal; 60 miles W.N.W. of Midnapour.

GALEANTHROPIA, of γαλεη, *cat*, and ανθρωπος, *man*, in the writings of the *Ancient Phyſicians*, a term uſed to expreſs a ſpecies of madneſs, in which the patient fancied himſelf a cat, and endeavoured to perform all the motions of that animal.

GALEARII, in *Antiquity*, *helmet-bearers*; a name the Romans gave to the black guards, or ſervants of the ſoldiers. See Vegetius iii. 6. and Salmaſius on the third chapter of the life of Adrian by Spartian.

GALEASSE. See Galley.

GALEATE Flowers. See Flowers.

GALEDUPA, in *Botany*, Rumph. Amboin. v. 2. 59. t. 13. Lamarck in Juſſ. 363. An Aſiatic leguminous tree of which little is known. The *Pungam*, Hort. Mal. v. 6, 5. t. 3, cited by Juſſieu with heſitation, ſeems to be very diſtinct.

GALEETO, in *Ichthyology*, the name of a fiſh of the alauda kind, called by Rondeletius *alauda non criſtata*, and

in

in Engliſh the mulgranoc and the bullcard. See *Blennius* Pholis.

GALEGA, in *Botany*, a word, according to John Bauhin, Hiſt. Plant. v. 2. 342, of Italian origin, and from the ſynonyms it ſeems poſſibly to be a corruption of *herba gallica*. However obſcure or barbarous its ſource, it has long been ſanctioned by general adoption. Linn. Gen. 384. Schreb. 506. Willd. Sp. Pl. v. 3. 1239. Mart. Mill. Dict. v. 2. Juſſ. 359. Tourn. t. 222. Lamarck Illuſtr. t. 625. Claſs and order, *Diadelphia Decandria*. Nat. Ord. *Papilionaceæ*, Linn. *Leguminoſæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, tubular, ſhort, divided half way down into five awl-ſhaped, nearly equal teeth. *Cor.* papilionaceous; ſtandard large, ovate, reflexed at the ſummit and ſides; wings oblong, almoſt as long as the ſtandard, each furniſhed with an appendage; keel oblong, compreſſed, ſtraight, tumid underneath towards the extremity, ſharp above. *Stam.* Filaments diadelphous (ſimple and nine-cleft); anthers oblong. *Piſt.* Germen ſuperior, ſlender, oblong; ſtyle ſlender, aſcending, ſhorter than the germen; ſtigma a minute terminal point. *Peric.* Legume very long, compreſſed, pointed, furrowed with oblong ſtreaks between the ſeeds. *Seeds* ſeveral, oblong-kidney-ſhaped.

Eſſ. Ch. Calyx with awl-ſhaped, nearly equal teeth. Legume of one cell, linear, with oblique ſtreaks between the ſeeds.

This genus, originally eſtabliſhed on the Goat's Rue, *Galega officinalis*; Linn. Sp. Pl. 1062, has ſince been much enlarged by the addition of many Cape, as well as tropical plants, ſo that the ſpecies in Willdenow amount to 37. Of theſe the G. *piſcatoria*, Ait. Hort. Kew. v. 3. 71, a native of the Eaſt Indies and South-ſea iſlands, is uſed to intoxicate fiſh, by being put into the water, ſo as to cauſe them to be eaſily caught by the hand. Many of the *flowers* are ornamental, being uſually of a pink or purpliſh colour. The *roots* are commonly perennial; the *ſtems* often ſhrubby. *Leaves* in ſeven ſpecies ternate; in the reſt elegantly pinnate, moſtly with numerous elliptical leaflets.

There are two ſpecies of Galega among the Chineſe. The firſt and largeſt is a thick, heavy plant, covered with a hard, reddiſh bark, whitiſh from within, and of a ſharp, bitter taſte. Its bloom is like that of the pea, inodorous, ſometimes of a blue and ſometimes of a white colour. It gives vinegar a very agreeable taſte, and is reckoned a ſpecific in diſorders of the breaſt. The ſecond ſpecies is a hard root, of the ſize of a little finger, reddiſh within and without, and of a ſtronger and more aromatic taſte than the former. The plant ariſing from it has the form of a little tree, with leaves ſimilar to thoſe of the myrtle. It ſhould be ſelected freſh, juicy, of a high colour, compact, odoriferous, and with a ſtrong aromatic taſte. The Chineſe cut it into pieces of the ſize of a filbert, in order that it may be dried and carried about with more eaſe. They conſider it as an excellent antidote. Theſe two ſpecies of Galega are cultivated in the province of Xanxy, and the merchants of the city of Tayvan moſtly deal in them. Rochon's Madagaſcar.

GALEGOS, in *Geography*, a town of Portugal, in the province of Entre Duero è Minho; 4 miles N.E. of Barcelos.

GALEIEN, a town of Pruſſia, in Natangen; 25 miles S.E. of Brandenburg.

GALELA, a town on the E. coaſt of the iſland of Gilolo. N. lat. 1° 58′. E. long. 127° 51′.

GALEN, Claudius, in *Biography*, a celebrated phyſician of antiquity, was born at Pergamus, a city of Aſia Minor, in the hundred and thirty-firſt year of the Chriſtian era, and about the 14th or 15th of the reign of Adrian. From the place of his birth he obtained the ſurname of Pergamenus. He has himſelf informed us that his father, whoſe name was Nicon, was an honourable and wealthy man, and poſſeſſed of conſiderable knowledge of the belles lettres, philoſophy, aſtronomy, geometry, and architecture. Nicon was ambitious of initiating his ſon in all the learning of the age; and, after having inſtructed him in the rudiments of knowledge himſelf, ſent him to the beſt ſchools of philoſophy. Whilſt engaged in ſtudying the principles of the different ſects, Galen ſoon diſplayed his judgment, by ſelecting the various parts of the doctrines of the ſtoics, academics, and peripatetics, which appeared to him rational, and totally rejecting the faſhionable ſyſtem of the Epicureans. About the age of ſeventeen, he began his attachment to the ſcience of medicine, over which he was deſtined to preſide for many centuries with oracular authority. During his youth he travelled much, partly with a view of profiting by converſation with the moſt intelligent phyſicians of the age, and partly for the purpoſe of learning whatever related to the drugs, which were the products of different countries. He reſided ſeveral years at Alexandria, which was then the great reſort of men of ſcience, and the beſt ſchool of medicine in the world. He viſited Cilicia, Paleſtine, and the iſlands of Crete and Cyprus; he made two voyages to Lemnos, in order to aſcertain the nature of the Lemnian earth, which was deemed a medicine of extenſive utility; and he went to Cælo-Syria to examine the opobalſam. At the age of twenty-eight he returned from Alexandria to Pergamus, where his practice was attended with diſtinguiſhed ſucceſs. Four years after this, in the thirty-ſecond year of his age, he left his native place, and went to Rome, where he attempted to eſtabliſh himſelf. But he encountered much oppoſition and jealouſy from the phyſicians of that city, who adhered to the principles of the methodic ſect; he was ſtigmatized by them as a theoriſt, and even as a dealer in magic. Nevertheleſs his merit was recognized by ſeveral Romans of learning and rank. He became extremely intimate with Eudemus, a peripatetic of great reputation, whom he cured of an obſtinate intermittent; and he obtained the eſteem of Sergius Paulus, the pretor; of Barbarus, the uncle of the emperor Lucius; of Severus, afterwards emperor; of Boëthus, a man of conſular dignity, and others, before whom he made ſeveval diſſections, and demonſtrated eſpecially the organs of reſpiration and of the voice. But wanting temper and experience, neceſſary to a ſucceſsful conteſt with a numerous and popular party, he returned to Pergamus, after a reſidence of four or five years, under the pretence of avoiding the plague, which then raged in the metropolis of the world.

Galen had made himſelf known, however, to advantage; for he had not remained long in his native place before he was ſent for to attend the emperors Marcus Aurelius and Lucius Verus, who were then at Aquileia. The appearance of the plague at this place compelled the emperors to depart haſtily on their return to Rome, whither Galen ſoon followed. Lucius died on the road; but Galen had obtained ſo much of the eſtimation of the good Aurelius, that, during his famous expedition into Germany, he committed to him the care of his ſons Commodus and Sextus. Theſe princes were ſeized with fevers, which Galen had the good fortune to cure; and he alſo gave a correct opinion of the iſſue of their diſeaſes, contrary to that of all his colleagues, which raiſed him to an eminence, from which he was able to defy the power, and finally to ruin the credit, of his former opponents.

It is not known with certainty how long Galen reſided at Rome,

Rome, after he went thither the ſecond time, or whether he ever returned to Aſia; nor are his biographers agreed as to the age which he had attained at his death. It ſeems probable from his writings that he lived at Rome under the emperors Marcus Aurelius, Commodus, and Severus; and Fabricius aſſerts that he died at the age of ſeventy; which, if we calculate from his birth, muſt have happened in the ſeventh year of the reign of the laſt mentioned emperor, or in the firſt year of the third century of the Chriſtian era.

The high eſtimation in which the character of Galen was held by his contemporaries, is evinced by the public reſpect which he enjoyed to the end of his days, amid thoſe violent political tumults that afforded very ſlender ſecurity to the merits of other individuals. The greateſt part of his life was ſpent in the zealous purſuit of knowledge; and every ſubject, poſſeſſing the moſt remote, real or imaginary connection with medical concerns, became the object of his ardent inveſtigation. As the fruits of his reſearches, we are told, that he compoſed five hundred different eſſays on the various parts of medicine, and half as many on other ſcientific ſubjects, connected with it. The conſciouſneſs of his ſuperior endowments, however, inflamed his vanity, and rendered him ſomewhat contemptuous towards his brethren: he even preſumed to compare himſelf with the emperor Trajan, in reſpect to the benefits which he conferred on the public. But great vanity was a common characteriſtic of the learned men of his time.

Without entering into a long detail of all the particular treatiſes written by Galen, it may be ſufficient here to notice the different editions of the whole of his works that have been tranſmitted to us. The Greek editions are thoſe of Aldus and Aud. Aſulanus, printed at Venice, 1525, in five volumes folio, and of Hieron. Gemuſæus, at Baſil, 1538, in the ſame form. The Latin editions are, that of Paris, 1536, folio, printed by Simon Colinæus; and reprinted at Lyons in 1554, with additions and corrections, by Joan. Frellonius:—that of Baſil, 1542, folio, printed by Frobenius, and edited by Gemuſæus:—thoſe of Baſil again in 1549, 1550, and 1562; the laſt of which contains a preface by Conrad Geſner, in which he comments with great judgment on the merits of Galen, and his works, and of his different tranſlators:—the edition of Venice, 1562, with the corrections of John Baptiſt Raſario:—ten editions publiſhed at Venice by the Juntas, in different years between 1541 and 1625; the ninth of which, printed in 1609, and the laſt, are preciſely the ſame, and are the beſt and moſt correct:—laſtly, an edition printed at Venice in 1541-45, by John Farræus, in ſeven volumes 8vo., with the notes of Ricci. An edition of Galen's works, both in Greek and Latin, in an elegant form, was publiſhed at Paris, in thirteen volumes, folio, by Réné Chartrier, including alſo the works of Hippocrates; it is deemed a correct work. See Eloy. Dict. Hiſt. Le Clerc. Hiſt. de Med. For an account of the particular treatiſes of Galen, ſee the author laſt quoted, and Haller. Biblioth. Med. Pract. Galen has twice mentioned our Saviour in his treatiſe "De differentia pulſuum;" and in his celebrated work "De uſu Partium Corporis humani," he has mentioned Moſes. Lardner's Works, vol. viii.

This great phyſician has recorded a ſtory of the power of muſic over the paſſions, ſimilar to what has been related of Pythagoras by Boethius. He ſays that Damon, the muſic-maſter of Socrates, ſeeing a young ſtranger inflamed with wine, in ſo violent a rage, that he was on the point of ſetting fire to the houſe of his miſtreſs, for preferring his rival to him; and, moreover, animated by the ſound of a flute playing to him in the Phrygian mode, had this young man reſtored to reaſon and tranquillity, by ordering the Tibicina, or female performer on the flute, to change her mode, and play in a grave and ſoothing ſtyle, according to the meaſure uſually given to the *ſpondee*. Galen, though he differs much from Aſclepiades on moſt other ſubjects, joins with him in the medicinal powers of muſic: and about the middle of the laſt century, the learned Dr. Bianchini, profeſſor of phyſic at Udine, collected all the paſſages preſerved in ancient authors relative to the medicinal application of muſic by Aſclepiades, who flouriſhed near a century before the Chriſtian era; and it appears from this compilation, (entitled "La Medicina d'Aſclepiade per ben curare le Malatie acute, raccolta da varii frammenti Greci e Latini," in Venezia,) that it was uſed as a remedy by the ancient Egyptians, Hebrews, Greeks, and Romans, not only in acute, but chronical diſorders.. And this writer gives ſeveral caſes within his own knowledge, in which muſic has been efficacious; but the conſideration, as well as the honour, of theſe, more properly belong to *modern* muſic than to the ancient. See MEDICINA *Muſica*, where this ſubject will be reſumed.

GALEN, in *Geography*, a military townſhip of America, in Onondago county, New York, ſituated on Canandarqua creek; 12 miles N.W. of the N. end of the Cayuga lake, and 13 S. by E. of Great Sodus. On the ſouth it is bounded by Junius.

GALENA, in *Mineralogy*, lead mineralized by ſulphur. (See LEAD, *Sulphuretted.*) The meaning formerly conveyed by this term was vague; for, beſides ſulphuret of lead, alſo common or black blende was meant by it. It was alſo uſed by Wallerius and others as a prefix to the names of various metals to denote their ſulphurets: thus we have Galena antimonii or ſtibii, which is our grey-antimony-ore; Galena cobalti, or white and grey-cobalt-ore; Galena zincina, Galena biſmuthi, &c.

GALENA *Inanis*, a name given by authors to a glittering ſubſtance, very much reſembling ſome of the plated ores of lead, but really containing none of that metal.

GALENIA, in *Botany*, ſo denominated by Linnæus in memory of the celebrated ancient phyſician Galen. Linn. Gen. 194. Schreb. 263. Willd. Sp. Pl. v. 2. 436. Mart. Mill. Dict. v. 2. Juſſ. 84. Claſs and order, *Octandria Digynia*. Nat. Ord. *Succulentæ*, Linn. *Atriplices*, Juſſ.

Gen. Ch. *Cal.* Perianth minute, inferior, four-cleft, concave; its ſegments oblong. *Cor.* none. *Stam.* Filaments eight, capillary, hardly ſo long as the calyx; anthers of two lobes. *Piſt.* Germen ſuperior, roundiſh; ſtyles two, ſimple, reflexed; ſtigmas ſimple. *Peric.* Capſule roundiſh, of two cells. *Seeds* two, oblong, angular.

Eſſ. Ch. Calyx four-cleft. Corolla none. Capſule roundiſh, of two cells, containing two ſeeds.

1. G. *africana*, Linn. Sp. Pl. 515. Suppl. 227. (Atriplex africana lignoſa luteſcens, roriſmarini foliis; Till. Hort. Piſ. t. 15.) "Upright, ſhrubby. Leaves linear, fleſhy."—Native of Africa. A humble plant of no attractive aſpect, ſomewhat reſembling an *Aſparagus*, with terminal panicles of ſmall inconſpicuous greeniſh-white *flowers*, which are ſeſſile in the forks of the panicle.

2. G. *procumbens*. Linn. Suppl. 227. "Procumbent. Leaves ovate, channelled, with ſpreading recurved points."—Gathered by Thunberg at the Cape of Good Hope.

GALENICAL SYSTEM. The profeſſors of medicine at Rome were divided into a number of ſects at the time when Galen appeared; and of theſe the methodiſts appear to have been in the higheſt eſtimation, and the empirics in the loweſt, while the dogmatics were again divided in regard to the authority to which they appealed, ſome preferring the tenets of Hippocrates, others thoſe of Eraſiſtratus, of Aſclepiades, &c. (See EMPIRIC). But Galen treated with deriſion

theſe ſlaves of authority, and profeſſed himſelf of the eclectic claſs, who adopted whatever was valuable in the writings of all phyſicians indiſcriminately. Hippocrates, however, was the author whoſe works he held in the higheſt eſtimation, and he ſeemed to conſider himſelf as the firſt who had diſcovered the true interpretation of his language. After writing much in the way of comment on the father of phyſic, and even defending his principles againſt thoſe of ſome of the ſectarians, he eſtabliſhed his own ſyſtem by filling up the outline, as it were, of the theory of Hippocrates, to which he made numerous additions. This ſyſtem was formed with conſiderable ingenuity, and was ſufficiently plauſible, in the abſence of more accurate phyſiological knowledge, to be received as the true ſyſtem of nature, and to occupy the attention of the medical world for thirteen centuries, excluding all rational inveſtigation, and therefore retarding, rather than aſſiſting, the progreſs of the ſcience. We can only pretend to give a ſlight ſketch here of the opinions of this extraordinary man.

Galen maintained, with Hippocrates, that the body was compoſed of four elements, fire, air, water, and earth, which were poſſeſſed of the qualities of hot, cold, moiſt, and dry. While theſe elements and qualities remained in juſt proportion to each other, the different parts of the body were in a ſtate of juſt *temperament*, and performed their reſpective functions well; in other words, the body remained in health. But when any of theſe elements or qualities became deficient or exceſſive, an *intemperies* enſued, the functions were imperfectly or painfully performed, or altogether ceaſed. The organs of the body, he alſo remarked, were or were not in a proper ſtate in reſpect to ſize, figure, number, ſituation, connection, or diſunion: and theſe circumſtances included all the varieties of health and diſeaſe. Hence the buſineſs of the phyſician was, on the one hand, to maintain the proper *temperament*, and to correct any *intemperies*; and on the other, to preſerve the ſize, figure, number, ſituation, and connection of the organs, and to re-eſtabliſh theſe conditions when diſordered. From this view of the ſubject two axioms were deduced. The firſt was, that it is neceſſary to retain all the parts in their natural condition, by means which are ſimilar in quality or power: *i. e.* heat is adapted to preſerve the quality of heat in a hot part, cold to retain the quality of cold in a cold part, &c.; and, in like manner, we muſt guard againſt the circumſtances which tend to alter the figure, ſize, connection, &c. of the organs. This maxim related to the *preſervation of health*. The ſecond regarded the *cure of diſeaſes*, and inculcated the neceſſity of correcting the intemperies, and the derangements in point of ſize, figure, &c., by means of *contrary quality or power; i. e.* where a warm part is become cold, heat muſt be applied; and where a certain motion, or by violence an organ has been diſplaced, a motion or violence of an oppoſite tendency muſt be employed to reſtore it to its ſituation; and ſo on. In a word, contraries are cured by their contraries, "contraria contrariis medentur."

All the curative intentions of the practitioner were fulfilled, according to Galen, by diet, medicines, or manual operation. The principal practical maxims which Galen adopted upon theſe points were thoſe which Hippocrates had taught. It muſt be obſerved, however, with reſpect to pharmacy, or the preparation and uſe of drugs, that much additional knowledge had been acquired ſince the time of Hippocrates, and many new medicines had been employed, both ſimple and compound. Upon the ſubject both of ſimple medicines, and of compounding them, Galen wrote many treatiſes; and as he had employed ſome fancy in aſſigning the particular intemperies to each diſeaſe, in the various combinations of hot and dry, hot and moiſt, cold and moiſt, &c.; ſo he exerciſed the utmoſt ſtretch of imagination in determining the properties of ſimples. For theſe properties were deduced from the four primary qualities of hot, cold, moiſt, and dry, and were conceived by him to exiſt each in four different degrees. Thus the quality of hot, for inſtance, was poſſeſſed by different ſubſtances in the firſt, ſecond, third, or fourth degree. Cichory was believed to be cold in the firſt degree, and pepper to be hot in the fourth degree. By the different combinations of theſe qualities, in their different degrees, he ſuppoſed that all medicines operated: and he even explained the ſenſible qualities of certain ſubſtances, ſuch as ſour, ſalt, acrid, &c. as depending upon the primary qualities juſt mentioned. Thus ſaltneſs, he ſaid, originated in the principle of heat; bitterneſs he deduced from dryneſs; ſourneſs from cold; &c. Theſe latter qualities, however, he conſidered as differing from the former, in the one inſtance being *actual*, in the other *potential*: thus fire is actually hot, pepper potentially; ice is actually cold, mandrake potentially. In theſe ſpeculations, it is obvious that Galen admitted the phantoms of the imagination to ſupply the place of obſervation and experience: but even this comprehenſive theory, like other gratuitous ſyſtems, left many facts to be explained by ſome occult principle, or ſpecific cauſe, the final reſort of human ignorance. The common operation of purgatives was explained by a ſpecific attraction of each purgative ſubſtance for a certain humour, which it diſcharged: hence, though Galen employed blood-letting to diminiſh plethora, he uſed purgatives only with the intention of evacuating *cacochymy*, or morbid humours.

There are other points in the phyſiology of Galen, which, for the ſake of perſpicuity, we have omitted to notice in the preceding ſketch; but which merit attention, inaſmuch as they conſtitute in part the foundation of the language of phyſiologiſts, even in the improved condition of our knowledge in modern times. With Hippocrates, he divided the living body into three principles, or component parts, the *ſolids*, the *humours*, and the *ſpirits*. The ſolids he ſubdivided into ſimple, and compound or organic. Of the fluids he recognized the four humours of Hippocrates, the *blood*, *phlegm*, *bile*, and *black bile*, or melancholy, and their relations to the four elemental properties which that ancient phyſician had maintained: namely, he regarded the blood as a red, hot, and moiſt humour; the phlegm, as white, cold, and moiſt; the bile, as yellow, hot, and dry; and the melancholy, as a black, cold, and dry humour. With reſpect to the ſpirits, Galen divided them into three ſpecies, the *natural*, *vital*, and *animal* ſpirits. The firſt of theſe were only a ſubtile vapour, ariſing from the blood, and deriving their origin from the liver, which he deemed the elaboratory of the blood. Theſe natural ſpirits, when carried to the heart, and mixed with the air, taken in by reſpiration, became vital ſpirits; which again were converted into animal ſpirits in the brain. Theſe three ſorts of ſpirits he conſidered as the inſtruments of the three different faculties, reſident in the parts in which each ſort of ſpirits was formed. The *natural* faculty, or function, he placed in the liver, and believed it to preſide over the nutrition, growth, and generation of the animal body. The *vital* function he lodged in the heart, and conceived, that by it heat and life were communicated to every part of the body through the canal of the arteries. The *animal* faculty, including the rational principle, he placed in the brain, and conſidered it as diſtributing the power of motion and feeling to every part, through the medium of the nerves, and as preſiding over the other faculties. (See FUNCTION.) Theſe three faculties produced the three ſorts of actions, according to Galen, which are deſignated by the ſame epithets, and

which

which he divided into *internal* and *external*. The internal animal actions are imagination, judgment, and memory; the external are the five ſenſes, and motion. The internal vital actions are violent paſſions, as anger, &c.; the external are motion, the pulſation of the arteries, and diſtribution of the ſpirits through them, diffuſing life and heat. The internal natural actions are ſanguification, the digeſtion of food, and the actions connected with it; the external are the diſtribution of blood by the veins for the purpoſes of nouriſhing, enlarging, and preſerving the body. Beſides theſe general faculties, Galen admitted of particular faculties, reſiding in each organ of the body, and directing its movements: and if he were aſked, what was the prime mover of all theſe faculties, he anſwered with Hippocrates, Nature.

We ſhall not attempt to detail his numerous diviſions of diſeaſe, or his views of the different cauſes, ſymptoms, diagnoſtic and prognoſtic ſigns, which his ſlavery of ſyſtem led him to arrange in peculiar orders and claſſes. Before we conclude, we muſt remark, that the little and equivocal notice of the pulſe taken by the more ancient phyſicians, is amply compenſated by the copiouſneſs of Galen; who, after making it the greateſt ſtudy of his life, left behind him ſixteen or ſeventeen different treatiſes on this ſingle ſubject. But it was a more abundant ſource of abſurd hypotheſis than any of his other ſpeculations: nevertheleſs he evinced his prudence, in pointing out the neceſſity of comparing the ſtate of the pulſe with all other ſymptoms, before a final judgment of any diſeaſe is formed. Le Clerc. Hiſt. de la Med. Walker's Memoirs. For a full account of the extent of the anatomical acquirements of Galen, the reader may conſult the elaborate work of Monſ. Le Clerc, juſt quoted. It remains for us only to notice the

GALENICAL *Pharmacy*, which formerly ſtood in oppoſition to *chemical* pharmacy. The medicinal ſubſtances uſed by Hippocrates were generally given ſingly, and in the moſt ſimple forms. Deviations from this rational cuſtom, however, had extended to an incredible degree before Galen, much of whoſe time was employed in arranging according to his own theories the multifarious compoſitions of his predeceſſors. But inſtead of ſimplifying, he conjoined with the labour of methodizing, a zeal to enlarge the overgrown catalogue. Excepting, however, in the number of ingredients, ſuppoſed to poſſeſs ſimilar qualities, which he heaped together in boundleſs profuſion, his pharmacy poſſeſſed conſiderable ſimplicity; for it included only vegetable productions, and was confined to the mere operations of powdering, boiling, or infuſing. This Galenical or vegetable pharmacy remained, for ten centuries, a perfect code, or ſealed book, from which practitioners in medicine thought it little leſs than ſacrilege to deviate, even on the moſt minute occaſions.

When the chemical reſearches of Paracelſus and Van Helmont had introduced certain preparations of mercury, and other metallic or mineral ſubſtances, into the materia medica, theſe innovations were oppoſed by the followers of the doctrines of Galen, and the partiſans aſſumed reſpectively the titles of *Galeniſts* and *Chemiſts*. Theſe titles, however, are now extinct, and the numerous frivolous hypotheſes of both ſects are exploded: the ſcience of modern times, while it has found the neceſſity of diſcarding from the catalogue of the materia medica numerous ſimples employed by the Galeniſts, and of ſimplifying their multifarious compounds, has at the ſame time borrowed from the laboratory of the chemiſts ſome of the moſt active and ſalutary agents upon the living animal body.

GALENISTS, in *Medicine*, ſee the preceding article.

GALENISTS, or *Galenites*, in *Eccleſiaſtical Hiſtory*, are a branch of Mennonites, or Anabaptiſts, who take in ſeveral of the opinions of the Socinians, or rather Arians, touching the divinity of our Saviour.

In 1664, the Waterlandians were divided into two parties, of which the one were called Galeniſts, and the other Apoſtoolians.

They are thus called from their leader, Abr. Galenus, a learned and eloquent phyſician of Amſterdam, who conſidered the Chriſtian religion as a ſyſtem, that laid much leſs ſtreſs on faith than practice; and who was for taking into the communion of the Mennonites all thoſe who acknowledged the divine origin of the books of the Old and New Teſtament, and led holy and virtuous lives.

GALEOBDOLON, in *Botany*, from γαλεη, *a weaſel*, or *cat*, and βδολος, a *fœtid ſcent*. It has occaſionally been a ſynonym for ſome ſpecies of *Galeopſis*, or plants akin to that genus, and is retained by Linnæus as the ſpecific name of the yellow Archangel, made a diſtinct genus by Hudſon. Hudſ. Fl. Angl. 257. Sm. Fl. Brit. 631. (Galeopſis; Linn. Gen. 292. Schreb. 389. Juſſ. 114. Leonurus; Willd. Sp. Pl. v. 3. 115.) Claſs and order, *Didynamia Gymnoſpermia*. Nat. Ord. *Verticillatæ*, Linn. *Labiatæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, tubular, with five unequal ſpreading teeth, each armed with a ſpinous awn, permanent. *Cor.* of one petal, ringent; tube ſhort, dilated upwards; limb gaping; upper lip incurved, elliptical, concave, entire; lower in three equal, acute ſegments; without any teeth at the edge of the orifice of the tube. *Stam.* Filaments four, awl-ſhaped, incurved under the upper lip, two ſhorter than the others; anthers roundiſh, bifid. *Piſt.* Germen ſuperior, four-cleft; ſtyle thread-ſhaped, about the ſame length and poſition as the ſtamens; ſtigma in two ſharp ſpreading diviſions. *Peric.* none, except the dried rigid calyx. *Seeds* four, angular, abrupt.

Eſſ. Ch. Calyx five-cleft, unequal, awned. Upper lip of the corolla entire, vaulted; lower in three acute ſegments.

1. G. *luteum*. Hudſ. 258. Sm. Engl. Bot. t. 787. With. 530. (G. Galeopſis; Curt. Lond. Faſc. 4. t. 40. Galeopſis Galeobdolon; Linn. Sp. Pl. 810. Dreves t. 20. Lamium luteum; Raii Syn. 240.) Yellow Dead-nettle; or Weaſel-ſnout.—Native of groves throughout Europe, to which it is very ornamental in the ſpring. It rather prefers a moiſt ſoil, and is perennial. The habit is that of a *Lamium*, not of a *Galeopſis*. *Stems* ſimple. *Leaves* oppoſite, ſtalked, heart-ſhaped, ſerrated. *Flowers* about ſix in each whorl, large, yellow, prettily ſpeckled with red. The herb has no very remarkable flavour, or quality. No other ſpecies is known.—Linnæus originally referred this plant to Leonurus, in which he has been followed by Scopoli, and more recently by Willdenow. The habit does not well accord, nor is the upper lip villous as in that genus.

GALEOLA, in *Natural Hiſtory*, the name of a genus of the *echinodermata*, or ſea hedge-hogs of the galeated, or helmet kind.

They have their name from the Latin *galeola*, a diminutive of the word galea, and which ſignified with the ancient Romans a drinking-veſſel, made in the ſhape of a ſmall helmet. Of this genus there are three known ſpecies. 1. A papilloſe kind, covered with ſmall eminences. 2. An undulated kind, with its ſtriæ reſembling waves. 3. The ſmooth kind. Klein.

GALEOPSIS, in *Botany*, from γαλεη, *a weaſel*, or *cat*, and οψις, *aſpect*, an old name, alluding to the mouth of the flower. Dr. Sibthorp, however, has proved the γαλεοψις of

Dioſcorides to be *Scrophularia peregrina*. Linn. Gen. 292. Schreb. 389. Willd. Sp. Pl. v. 3. 91. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 628. Juſſ. 114. Lamarck Illuſtr. t. 506. Claſs and order, *Didynamia Gymnoſpermia*. Nat. Ord. *Verticillatæ*, Linn. *Labiatæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, tubular, with five rather unequal ſpreading teeth, as long as the tube, each armed with a ſpinous awn, permanent. *Cor.* of one petal, ringent; tube ſhort; limb gaping; orifice rather wider than the tube, as long or longer than the calyx, bearing on each ſide, at the baſe of the lower lip, a little pointed tooth-like protuberance, hollow at the back; upper lip roundiſh, concave, ſerrated at the top; lower in three ſegments, the lateral ones roundiſh, the central largeſt, emarginate, and crenate. *Stam.* Filaments four, awl-ſhaped, concealed by the upper lip; two of them ſhorteſt; anthers roundiſh, cloven. *Piſt.* Germen ſuperior, four-cleft; ſtyle thread-ſhaped, about the ſame length and poſition as the ſtamens; ſtigma in two ſharp ſpreading diviſions. *Peric.* none, except the rigid, upright or cloſed calyx. *Seeds* four, angular, abrupt.

Eſſ. Ch. Calyx five-cleft, awned. Upper lip of the corolla notched, vaulted; lower with two teeth on its upper ſide.

Obſ. Linnæus remarks, that in G. *Ladanum* the upper lip of the corolla is ſomewhat reflexed at the apex, and ſcarcely at all crenate, but we do not find this quite applicable to our plant; ſee Eng. Bot. t. 884. In G. *Tetrahit* Dr. Smith obſerved at Matlock a remarkable variety of ſtructure, the terminal flowers of each branch having a regular quadrifid ſalver-ſhaped corolla, with four equal ſpreading ſtamens, whilſt all the others were of their uſual ſhape. See Linn. Fl. Lapp. ed. 2. 201. Some botaniſts take this genus, at leaſt ſome of its ſpecies, for the γαλεοψις of Dioſcorides, whilſt others ſuppoſe *Lamium purpureum* to be what he intended under that name. The late profeſſor J. Sibthorp has, in our opinion, ſettled the point by obſervations on the ſpot, and propoſes *Scrophularia peregrina* as moſt correctly anſwering to all the ancient deſcriptions, as well as growing where Dioſcorides relates. See Prodr. Fl. Græc. v. 1. 406 and 435. He found no real *Galeopſis* in Greece or its neighbourhood. We have four ſpecies of *Galeopſis* in England, of which G. *verſicolor*, Engl. Bot. t. 667, often called the Bee Nettle, from the reſemblance of its lip to the Bee Orchis, is the moſt ſpecious, and is truly a beautiful flower. It grows in ſandy fields, and, like its congeners, is an annual, eaſily propagated by ſeed. The herbage has an inelegant nettle-like aſpect, beſet with pungent prickles. Willdenow's Species Plantarum enumerates four ſpecies, but he has not our G. *villoſa* among them, and he divides G. *Ladanum* into two, perhaps not improperly.

GALEPSUS, in *Ancient Geography*, a Greek town which authors have attributed, at different periods, to Thrace, or to Macedonia. It was ſituated on the weſtern coaſt of the peninſula, adjoining, on the weſt, to that on which mount Athos ſtood. This peninſula was denominated Sithonia. Galepſus was about a mile from the coaſt, having to the N.W. Myla, and to the S.E. Torone, which gave name to the Toronaic gulf. It was a colony of Thaſians, according to Thucydides.

GALERA, in *Geography*, a town of Spain, in the province of Grenada; 5 miles S.S.E. of Hueſca.—Alſo, a town of Spain, in the province of Catalonia; 5 miles S.S.W. of Tortoſa.

Galera, a ſmall iſland in the Mediterranean, on the coaſt of Minorca.

Galera, *Cape*, a cape on the coaſt of South America, on the Spaniſh Main. N. lat. 11°. W. long. 75° 20'.—Alſo, the eaſt point of the iſland of Trinidad. N. lat. 10° 45'. W. long. 60° 30'.—Alſo, a town of Italy, in the Patrimony of St. Peter; 9 miles S.E. of Bracciano.—Alſo, a river of Mexico, which runs into the Pacific ocean. N. lat. 15° 55'.

Galera, in *Zoology*, a ſpecies of *Muſtela*; which ſee.

GALERIA, or Galaria, in *Ancient Geography*, a town of Sicily, according to Diodorus Siculus. Stephanus, the geographer, calls the town "Galarina Urbs," and the country "Galaria."

Galeria, *Gulf of*, in *Geography*, lies on the N.W. coaſt of the iſland of Corſica. N. lat. 42° 27'. E. long. 8° 44'.

GALERICULATE Flowers. See Flowers.

GALERITA, in *Ichthyology*, the creſted blenny, called alſo adonis. See Blennius.

GALERIUS, ſurnamed *Armentarius*, and ſtyled alſo the younger *Maximian*, in *Biography*, was appointed Cæſar by Diocleſian, March 1ſt, A. D. 292, and in the year 305 advanced to the Imperial throne. In 307, he elevated Licinius to the rank of Auguſtus, ſo that at this time there were in reality ſix Roman emperors, *viz.* Maximian, Galerius, Conſtantine, Maximin, Maxentius, and Licinius. Galerius died in 311, of a long and grievous diſtemper, ſuppoſed to have been inflicted upon him as a judgment from heaven for his inhuman treatment of the Chriſtians. For other particulars relating to him, ſee Dioclesian and Persecution.

GALERON, in *Geography*, a town of the iſland of Celebes, celebrated for its fiſhery; 15 miles from Macaſſar.

GALESUS, (Cervaro,) in *Ancient Geography*, a river of Italy, in the vicinity of Tarento, mentioned by Virgil and Martial.

GALETS, in *Geography*, an iſland at the N.E. end of lake Ontario, and in the ſtate of New York; 3 miles S.W. of Roebuck iſland.

GALETTE, La, a neck of land in the river St. Laurence, in Canada. The land adjoining to it is very good. It is 1½ league above the fall called Les Galots.

Galette, *Riviere à la Vielle*, a river of Upper Canada, which runs into the river St. Laurence, above iſle Fort Levi. N. lat. 44° 46'. W. long. 75° 27'.

GALEUS, in *Ichthyology*. See Squalus.

Galeus *Rhodius*, a name given by Athenæus and ſome other of the old writers, to a very large and delicate fiſh. Schoneveldt is of opinion, that they meant by it the ſturgeon, and brings many good reaſons for his opinion. See Acipenser *Sturio*.

Galeus *Stellatus*, the *ſtarred hound fiſh*, in *Ichthyology*, a kind of hound fiſh remarkably ſpeckled, with white ſpots in form of ſtars.

GALEXIA, a name given by Galen, and ſome of the other ancient writers, to the common lamprey.

GALGALA, in *Geography*, a town of Hindooſtan, in the country of Viſiapour; 48 miles S. of Viſiapour. N. lat. 16° 42'. E. long. 75° 25'.

GALGON, a town of France, in the department of the Gironde; 5 miles N. of Libourne.

GALGULUS, in *Ornithology*, a ſpecies of *Pſittacus*; which ſee.—Alſo, a ſpecies of *Corvus*; which ſee.—Alſo, a ſpecies of *Coracias*, Coracias garrula, or roller; and alſo the Coracias ſinenſis; ſee Coracias.—Alſo, a ſpecies of *Tetrao*, or the Tetrao nævius. See Tetrao.

GALHANO, in *Geography*, a town of Portugal, in the province of Beira; 12 miles N.E. of Coimbra.

GALI, in the *Materia Medica*, a name given by ſome to the

the indigo, or feculæ of the plant anil, uſed in dyeing, &c. Garcias gives us this name, and ſays, that the plant is like the mangirique; but Cluſius tranſlating this word by ocymum or baſil, has ſtrangely perplexed the caſe: the anil or indigo plant not having any reſemblance of that herb.

GALIAN, in *Ichthyology*, a ſpecies of *Cyprinus*; which ſee.

GALIANI, Ferdinand, in *Biography*, was born in the year 1728, at Chieti, a town of Abruzzi, where his father, a nobleman, was aſſeſſor of the royal court of juſtice. He was deſtined for the ſtudy of the law, and was carefully educated with that view. He was much given to ſatire, and being refuſed admiſſion into an academy, he made uſe of his powers of invective againſt that body before he was eighteen years of age, which firſt made him known as a writer. In a ſhort time afterwards he applied his talents to more important and ſerious ſubjects. The public finances of the two Sicilies had become much deranged, and various plans had been propoſed to remedy the evil, but without ſucceſs. War and ſome other events cauſed a prodigious influx of money into them from Spain, France, and Germany; many regulations were immediately made to promote the trade, the arts, and the proſperity of the country; nevertheleſs the ſpecie ſeemed at once, as it were, to diſappear; the price of commodities ſuddenly roſe; a great alteration took place in the courſe of the exchange, and many commercial houſes were reduced to a bankrupt ſtate. In this ſtate of affairs Galiani wrote a work in five books "On Money and Specie," which was publiſhed in the year 1750. Diffident, perhaps, of his own talents, he printed it without his name, and it was for a conſiderable time a principal topic of converſation. Few works, at that period, diſplayed ſo much order, preciſion, and boldneſs of thought, and in which the ſubject was treated in ſuch clear and elegant language. It was received with univerſal approbation in his own country, and among the literati of other nations. When its fame was fully eſtabliſhed, the author diſcovered himſelf, to the great joy of his uncle, the archbiſhop of Tarento, and his other friends. He now obtained preferment in the church, and at the expence of his uncle he was enabled to make a tour through Italy, which procured him an acquaintance with the moſt eminent men of letters in that country. About the year 1755 he began to form a collection of all kinds of ſtones found in the neighbourhood of Veſuvius, and having amaſſed one hundred and forty-one ſpecimens, he publiſhed a treatiſe, in which he gave an explanation of them; and immediately tranſmitted the collection, with the printed deſcription, to pope Benedict XIV., and on one of the boxes he inſcribed the following words:

"Beatiſſime pater, fac ut lapides iſti panes fiant."

The holy father was ſo much pleaſed with the preſent and with the inſcription, that he gave Galiani the living of Canonica, worth four hundred ducats per annum. He became a member of the academy of Herculaneum, the object of which was to explain and illuſtrate the antiquities of Herculaneum, Pompeia and Stabia; a conſiderable ſhare of the buſineſs fell to his lot, which he performed with much diligence and ſagacity. On the death of Benedict XIV. his friend and patron, he wrote his eulogy, and diſplayed upon the occaſion a vaſt flow of eloquence, as well as much of the noble principle of gratitude. This was in 1758, and in the following year he was appointed ſecretary to the French embaſſy, which was the commencement of his public career. He was but little pleaſed with Paris at firſt, but his wit and convivial turn procured him admiſſion into the firſt company, the friendſhip of the moſt eminent literary characters, and the general reputation of a great man. At Paris he begun to write annotations on Horace, in which he examined the occaſion and ſubject of each poem, and exhibited the progreſs which Horace himſelf made in poetry till he attained to a perfection that can never be imitated. In the year 1763, the celebrated geographer Zannoni of Padua was at Paris, having been invited thither by Louis XVI., for the purpoſe of determining the boundaries between the French and Engliſh poſſeſſions in America. Galiani employed him to make a new and improved map of the kingdom of Naples. In conſequence of an alarming ſcarcity of corn, which had prevailed in France for many years, and which had often been the occaſion of diſtreſs, famine, and inſurrection, Galiani wrote, in the French language, a work on the corn trade, conſiſting of eight dialogues. The king, to encourage, as he thought, the intereſts of agriculture, prohibited, in the year 1764, the free exportation of corn from all the provinces of the kingdom. Galiani undertook to ſhew that this and other regulations adopted by the court were the cauſes of the ſcarcity, and of the numerous diſorders that attended it. While he remained at Paris, he did not venture to oppoſe the prejudices of the country, but as ſoon as he left that place, his work appeared under the title of "Dialogues ſur le Commerce des Bleds;" Londres 1770-8; and it immediately excited conſiderable attention in France. Numerous writers appeared againſt him till the court interfered in favour of the ſyſtem recommended by Galiani. Upon his return to Naples the moſt conſiderable men of France entered into an epiſtolary correſpondence with him: their letters form nine large volumes in quarto. He died in October 1787, in the fifty-ninth year of his age. He is ſaid to have poſſeſſed his uſual ſpirits and vivacity till his laſt moments. Beſides the commentary on Horace, and the dialogues already referred to, he wrote, in three books, "A treatiſe on the innate Propenſities or Inclinations of Men, or the Principles of the Law of Nature and Nations, deduced from the Poems of Horace." To this work was prefixed a life of the poet, which contained no information but what was collected from his poems. In 1779 he publiſhed a book on the Neapolitan dialect; in which he explains the grammatical rules of it, and gives an account of all the writers who have made uſe of it. He was employed on a work "On the natural Duties of Princes to other belligerent Powers," which made its appearance in 1782, and was afterwards tranſlated into the German language. It was written in conſequence of the war between the Engliſh, French, and Spaniards, in which the Neapolitans, and other courts, remained neuter. The merit of Galiani was known and reſpected by the ſeveral monarchs of Europe, and no ſtranger of diſtinction arrived at Naples without endeavouring to form an acquaintance with him. The emperor, Joſeph the Second, during his reſidence in that city, often honoured him with an interview. Catharine the Second of Ruſſia not only ſent him preſents, but requeſted the academy of Peterſburgh, in the year 1782, to elect him a member. A life of Galiani, written by Louis Diodati, was publiſhed at Naples in 1788. Gen. Biog.

GALIATA, in *Geography*, a town of Italy, in the department of the Gogna, ſituated between the Teſino and the Gogna; 4 miles N.E. of Novara.

GALIBIS, or Charaibes, a nation of Indians, inhabiting near New Andaluſia, in South America; from which ſome have ſuppoſed the Charaibes of the Weſt Indies to be deſcended.

GALICANA, a town of the republic of Lucca; 13 miles N. of Lucca.

GALICIA, or Galitzia, a province, or kingdom, taken

from Poland by the houſe of Auſtria; compoſed of the palatinates of Lublin, Sandomir, and Cracow; together with Little or Red Ruſſia, including the palatinates of Lemberg, Chelm, and Belz; a part of the palatinates of Bielſk, Volhynia, Maſovia, and Podolia; and a ſmall portion of the Lithuanian palatinate of Brſeſk. This province lies to the north of Hungary, from which it is ſeparated by the Carpathian Mountains; about 280 miles in length, and from 60 to 100 in breadth. The capital is Lemberg or Leopol. It is watered by the Dneiſter, the San, and ſeveral other rivers.

GALIGNANA, a town of Iſtria; 14 miles N.E. of Rovigno.

GALILEANS, Galilæi, a ſect among the ancient Jews, denominated from Judas of Galilee, or the Gaulonite, their chief; who, eſteeming it unworthy that the Jews ſhould pay tribute to ſtrangers, raiſed up his countrymen againſt the edict of Auguſtus, which had ordered a cenſus or enumeration to be made of all his ſubjects.

Their pretence was that God alone ſhould be owned as maſter, and called by the name of the *Lord*: in other reſpects they had much the ſame doctrine as the Phariſees; but as they judged it unlawful to pray for infidel princes, they ſeparated themſelves from the reſt of the Jews, and performed their ſacrifices apart. The ſons of Judas were crucified in the time of Claudius. His grandſon Eleazar, after Jeruſalem was taken, defended a ſtrong fortreſs with 960 of his moſt deſperate followers. When the battering ram had made a breach, they turned their ſwords againſt their wives, their children, and at length againſt their own breaſts. They died to the laſt man.

As our Saviour and his apoſtles were of Galilee; they were ſuſpected to be of the ſect of Galileans; and it was on this principle, as St. Jerome obſerves, that the Phariſees laid a ſnare for him; aſking whether it was lawful to give tribute to Cæſar; that in caſe he denied it, they might have an occaſion of accuſing him. Vid. Joſeph. Ant. Jud. lib. xviii.

The learned Dr. Lardner has ſhewn in his "Jewiſh and Heathen Teſtimonies," (apud Works, vol. vii. p. 355.) that the Chriſtians in early days, as well as afterwards, were opprobriouſly called Galileans. (Acts, ii. 7.) Epictetus, in the time of Adrian, about the year of our Lord 120, ſeems to refer to Chriſtians under this appellation; and the emperor Julian, who both deſpiſed and hated the Chriſtians, and who, well apprized that they gloried in the name of their redeemer, countenanced, and perhaps enjoined, the uſe of the leſs honourable appellation of Galileans.

GALILEE, in *Ancient Geography*, a province of Aſia, being a part of Paleſtine, ſituated to the north of the country of Samaria. This province was divided into Upper and Lower Galilee. The former included the half tribe of Manaſſeh (ſee Manasseh), and was called "Galilee of the Gentiles," probably becauſe it contained moſt of that deſcription, who had been ſpared by the Manaſſites, or rather, becauſe it lay contiguous to the heathen nations. The latter, or Lower Galilee, was ſo called on account of its ſituation, being flat and low in compariſon of the other, which was altogether mountainous. The Lower Galilee lay on the fartheſt northern verge of Judea, and included the tribes of Aſher, Zabulun, Naphtali, and Iſſachar, ſettled by lot. This country was very fertile and champaign, except on the northern ſide towards Syria; produced excellent corn, wine, oil, fruits of all ſorts, with little labour; and was, in its flouriſhing ſtate, ſo full of towns and villages, that Joſephus, who was made governor of it, informs us, the leaſt of them contained 15,000 ſouls; but allowing for his exaggeration, the country was really very rich and populous, and its inhabitants, active and laborious, were ſtout and warlike, and very zealous for the Jewiſh religion. As the country was very fertile, it was of courſe very populous. It had, in particular, a ſpacious valley, ſo very rich, that it was emphatically denominated "the Fat valley," ſince better known by that of St. George, from a fort or caſtle built in it, and dedicated to that ſaint. As Nazareth was ſituated in this province, our bleſſed Lord was called a Galilean. The Galileans ſeemed to have had a dialect different from that of the Jews in general, for Peter was hence denominated a Galilean.

Galilee, *Sea of*, ſo called becauſe it was almoſt ſurrounded by the province of the ſame name, a lake of Paleſtine, formed by the river Jordan, which ran through it, and ſupplied it with freſh water. This is alſo ſtyled in the ſacred writings the ſea and lake of Kinnereth, or Cinnereth, and the lake of Geneſareth or Genezar. The Jewiſh hiſtorian commends it highly, amongſt other things, for the ſweetneſs, coolneſs, and excellence of its water, as well as the abundance and variety of its fine fiſh. It was in this lake that the apoſtles Peter, Andrew, John and James exerciſed their profeſſion of fiſhermen. According to Joſephus, it was 100 furlongs in length, and about 40 in breadth.

Galilee, in *Architecture*, a portico which was uſually built at or near the weſt end of the great abbey churches. Such a one ſtill remains, under the name of the "galilee," at the weſtern extremity both of Durham and Ely cathedrals. In this porch the monks collected themſelves, and drew up in returning from ſome of their proceſſions. Here alſo dead bodies were ſometimes depoſited previouſly to their interment; and here alone, in certain monaſteries, females were allowed to ſee the monks of it to whom they were related, or even to attend divine ſervice. Hence, the galilee at Durham was fitted up in a very ornamental way for this purpoſe, and a line of blue marble was drawn from the principal entrance on the north ſide of the church to the oppoſite ſide, beyond which women were not allowed to go eaſtward towards the high altar, but were required to turn weſtward into the galilee. Many improbable conjectures have been formed concerning the derivation of this name. The real occaſion of it ſeems to be this. When any female applied at the abbey gate for leave to ſee her relative who was a monk there, ſhe was directed to the weſtern porch of the church, and told in the terms which ſo frequently occur in the ſervice of the paſcal time, alluding to Mat. xxviii. 10. and Mark xvi. 7, that "ſhe ſhould ſee him in Galilee." This explanation is confirmed by a paſſage of Gervaſius, the monk of Canterbury. De Combuſt. et Repar. Dorob. Ecc. Twyſd. X. Script.

GALILEI, Vincenzio, in *Biography*, a Florentine nobleman, and father of the great Galileo Galilei, had received inſtructions in muſic from Zarlino; but being a performer on the lute, and of courſe a friend to the doctrines of Ariſtoxenus, which Zarlino, a favourer of tempered ſcales, conſtantly combats, he cenſured his maſter in a ſmall tract, entitled "Diſcorſo intorno all' Opere di Zarlino;" which not paſſing unnoticed in the ſecond volume of the theoriſt's works, Galilei, in 1581, publiſhed "Dialogo della Muſica antica e moderna, in ſua difeſa contra Giuſeppe Zarlino," in which he becomes an open antagoniſt. To analyſe the reaſonings on both ſides of this controverſy would afford the reader very little ſatisfaction, as it would be difficult to render the ſubject intereſting; we ſhall therefore only obſerve that beſides the diſpute with Zarlino, this work contains many miſcellaneous articles, ſome of which are amuſing and curious; however, there are others which are contra-

contradictory, and hazarded without ſufficient information or enquiry; and the author manifeſts no deep reſearch into antiquity, when he boldly aſſerts, p. 101, that the *battuta*, or beating time, was *not* practiſed by the ancients; and p. 133, that the monochord was invented by the Arabians.

It was the opinion of Galilei, that in his time there were not more than four great performers on the organ, who were likewiſe compoſers, in all Italy, which more abounded with muſicians than any other part of the world; and theſe were Annibale Padovano, Claudio da Coreggio, Giuſeppi Guami, and Luzzaſco Luzzaſchi. He mentions the viola d'arco and violone, but not the violin: and complains of the muſical *embroiderers* of his time, who, by their changes and diviſions, ſo diſguiſed every melody, that it was no longer recognizable, but reſembled the repreſentations of the firſt painters in oil, Cimabue and Giotto, which required the names to be written under them for the convenience of the ſpectator, who, without ſuch aſſiſtance, would be unable to diſtinguiſh a roſe from a lily, a rabbit from a hare, a ſparrow from a linnet, or a lobſter from a trout.

He ſays, that the Italians, who were in poſſeſſion of the harp before the time of Dante, had it from Ireland; and adds, that it is only a cithara with many ſtrings; having, when Galilei wrote, four octaves and a tone in compaſs. And as the harp came from the cithara, ſo the harpſichord had its origin from the harp: being nothing more than a horizontal harp, as every one who examines its figure with that idea muſt ſee. The *cetera*, or guittar, he ſays, was furniſhed to Italy by the Engliſh, who were formerly famous for making ſuch inſtruments.

Galilei is ſaid to have been aſſiſted in this controverſy by Girolamo Mei, a Florentine nobleman, mathematician, philoſopher, and theoretical muſician.

Battiſta Doni, in his "Trattato 2do. ſopra gl'Inſtrumenti di Taſti," or keyed inſtruments, ſays, that in the beginning of his muſical ſtudies, his partiality for the muſic of the ancients was greatly increaſed by the peruſal of the Dialogue of Galilei, in which Mei had the greater part, (dove il Mei ebbe la meggior parte), and ſtill more by a treatiſe written by this learned perſonage (Mei) De Modis Muſicæ, a MS. preſented to the Vatican library by Monſig. Guarengo, Op. Om. tom. i. p. 324. Doni has ſupported this aſſertion by no proof; but in the Vatican library, among the queen of Sweden's MSS. there is a volume of inedited tracts and letters, written by Girolamo Mei, upon the muſic of the ancients, in which are diſcoverable, not only opinions ſimilar to thoſe of Galilei, but frequently the words in which they are expreſſed in his Dialogue; particularly in a letter from Mei, dated Rome, 1572, in anſwer to two that he had received from Galilei, in which he ſeems to have been conſulted concerning the uſual difficulties which thoſe have to encounter who undertake to diſcuſs the muſic of the ancients. We procured a copy of this entire letter, and conſiderable extracts from the other writings of Mei, which indeed contain the whole ſubſtance of Galilei's Dialogue, except what concerns his controverſy with Zarlino relative to the muſical ſcales and proportions of the ancients.

G. Battiſta Doni, ſpeaking of the inventors of recitative, ſays, Vincenzio Galilei was at this time in ſome credit among muſicians, and, flattered with his reputation, he purſued his ſtudies with ſuch diligence, that after the publication of his "Dialogue on Ancient and Modern Muſic," he attempted new things, and with the aſſiſtance of ſig. Barde, count of Vernia, he was the firſt who compoſed melodies for a ſingle voice; having modulated that pathetic ſcene of Count Ugolino, written by Dante, which he ſung himſelf very ſweetly to the accompaniment fo a viol. This eſſay certainly pleaſed very much in general; however, there were ſome individuals who laughed at the attempt; notwithſtanding which, he ſet, in the ſame ſtyle, parts of the Lamentations of Jeremiah, which were performed to a devout aſſembly.

GALILEI, GALILEO, an eminent mathematician, philoſopher, and aſtronomer, flouriſhed towards the cloſe of the 16th and beginning of the 17th centuries, and immortalized his name by his inventions and diſcoveries. He was the ſon of Vincenzio Galilei (ſee his article), and born at Piſa, in Italy, in the year 1564. The attention of his youth was engaged by the amuſing ſtudies of poetry, muſic, and drawing; but in the progreſs of his years theſe were exchanged for other and ſublimer ſciences, in which he was deſtined to excel. Intended by his father for the medical profeſſion, he was educated in the univerſity of Piſa; but conceiving a diſlike to the ſtudy of medicine, as well as to the Ariſtotelian philoſophy which was then taught in the ſchools, the predominant bias of his mind led him to cultivate an acquaintance with mathematics, and with the other ſciences that are connected with it; and he was allowed by his father to indulge his natural inclination without reſtraint. Having been well inſtructed in the Greek language, he read Euclid, Archimedes, and other mathematicians in the original. The reputation which he acquired in this department of ſcience was ſo diſtinguiſhed, that, before he was 26 years of age, he was appointed by the duke of Tuſcany to the chair of mathematical profeſſor in the univerſity of Piſa. In the regular diſcharge of his profeſſional duties he gave ſatisfaction to the more liberal and enlightened of his auditors; but his ſituation was rendered unpleaſant to him by the envy and jealouſy of the bigotted Ariſtotelians, who took occaſion to reproach him as a viſionary and dangerous innovator. Diſguſted by their conduct, he accepted, in the year 1592, an invitation which he received from the republic of Venice to occupy the mathematical chair in the univerſity of Padua. In this ſituation he continued for 18 years, contributing very much to the reputation and popularity of the ſeminary with which he was connected. Tuſcany, however, by degrees felt an increaſing ardour for improvement; and the patriotiſm of Galileo rendered him deſirous of devoting his ſervices to the benefit of his native country. His inclination being made known to Coſmo II., the grand duke, he was immediately invited to Piſa, and in 1611 appointed profeſſor of mathematics, with a conſiderable ſtipend. The grand duke afterwards invited him to Florence, giving him the title of principal mathematician and philoſopher to his highneſs, and continuing his ſalary of profeſſor at Piſa, without the obligation of reſidence. In this, as well as in other ſituations, Galileo united with the ſtudy of mathematics that of phyſics, and particularly the doctrines of mechanics and optics. Indeed, before his ſettlement at Padua he had written his "Mechanics," ſtating the advantages to be derived from that ſcience and its inſtruments; and alſo his "Balance," for finding the proportion of alloy in mixed metals. Being informed, in the year 1609, that Janſen, a Dutchman, had invented a glaſs, which made diſtant objects appear as if they were near, he turned his attention to the ſubject, and invented and conſtructed an inſtrument, by which, as he ſays, objects appeared magnified one thouſand times. Turning this inſtrument, or teleſcope, towards the heavens, he was even aſtoniſhed by the objects that preſented themſelves to his view. On the ſurface of the moon he ſaw lofty mountains and deep vallies. The galaxy, or milky way, he diſcovered to be a crowded aſſemblage of fixed ſtars, inviſible to the naked eye. Venus

he

he found to vary in its phaſes like the moon. The figure of Saturn he diſcovered to be oblong, conſiſting of three diſtinct parts, two of which were *anſæ*, or extreme parts of the ring. Jupiter he ſaw ſurrounded with four moons, which he named Medicean ſtars: and on the ſun's diſc he perceived ſpots, from the motion of which he inferred, that the ſun revolves about its axis. The duke of Tuſcany, to whom he dedicated an account of theſe diſcoveries, wrote him a congratulatory letter on the occaſion; and whilſt aſtronomers in general applauded his attempts, ſome ſuſpected that his ſuppoſed diſcoveries were the amuſing dreams of his own imagination. Deſirous of applying his diſcoveries to ſome practical uſe, he engaged his patron, the duke, to apprize the king of Spain of the great benefits which navigation might derive from them; but his ſuggeſtion ſeems to have been diſregarded. Convinced of the truth of the Copernican ſyſtem, he availed himſelf of his diſcoveries in illuſtrating and confirming it; and though he publiſhed a treatiſe, in which it was proved, from the authority of the fathers and orthodox divines, that the language of Scripture is not to be ſtrictly followed in queſtions that are merely phyſical, the ignorant and bigotted clergy were alarmed; and this incomparable philoſopher was, in the year 1615, cited before the court of inquiſition, accuſed of hereſy, and thrown into priſon. The charge of hereſy was ſupported by allegations againſt him, that he maintained the two following propoſitions, *viz.* that the ſun is the centre of the world, and immoveable by a local motion, and that the earth is not the centre of the world, nor immoveable, but that it moves with a diurnal motion. Theſe propoſitions, which he was not ſuffered to explain or defend, he was ordered by the inquiſition to renounce, and he was prohibited from vindicating them either in converſation or writing. It is generally ſaid, that he was actually committed to the priſon of the holy office, and confined there about five months; but ſome accounts ſtate, that in conſequence of the interpoſition of the duke of Tuſcany, and of other perſons of high rank and influence at the papal court, he was treated with mildneſs, and merely threatened with impriſonment, if he ſhould prove refractory. It is certain, however, that he was obliged to conform to the decree of the inquiſition before he was permitted to leave Rome. Having obtained his releaſe, he reſumed and purſued his ſtudies, and laid before the public an account of his diſcoveries, which tended more and more to eſtabliſh the opinions which the court of inquiſition had condemned. In the year 1632, notwithſtanding the danger to which he expoſed himſelf, he had the reſolution to publiſh his famous "Dialogues on the two greateſt Syſtems of the World, the Ptolemaic and Copernican," urging arguments in favour of each, without abſolutely deciding for either, but inſinuating his attachment to that of Copernicus. In theſe dialogues he alſo introduces ſome ſtrokes of raillery againſt the Ariſtotelians, on account of their bigotted and ſervile attachment to every hypotheſis of their maſter. The cry of hereſy was inſtantly renewed, and Galileo was again cited to appear before the tribunal of the inquiſition in 1633.

At the age of 70 years this venerable philoſopher was obliged to comply with the citation; and, on his arrival at Rome, he was committed priſoner to the apartments of the fiſcal of the holy office. But at the interceſſion of the grand-duke he was permitted to reſide in the houſe of his ambaſſador during the proceſs that was carried on againſt him. After a trial of about two months, he was brought to receive ſentence in full congregation, and ſolemnly ordered to abjure and condemn the Copernican ſyſtem, as contrary to the Scriptures, and to bind himſelf by oath no longer to teach or ſupport it, either directly or indirectly. As a puniſhment for having diſobeyed a former decree of the holy office, he was detained in priſon at the pleaſure of the cardinal inquiſitors, and enjoined, as a ſaving penance, for three years to come, to repeat, once a week, the ſeven penitential pſalms; the court reſerving to itſelf the power of moderating, changing, or taking away, wholly or in part, the above-mentioned puniſhment and penance. His "Dialogues" were alſo cenſured, prohibited, and ordered to be burnt at Rome. The rigour of his ſentence was afterwards conſiderably abated by pope Urban VIII.; and he was at length, *viz.* in 1634, permitted to reſide at his country-houſe at Arcetri, in the neighbourhood of Florence. Here he ſpent the reſidue of his days, proſecuting his ſtudies and obſervations, and communicating the reſult of them occaſionally to the public; and here he was viſited by perſons of the principal rank and character at Florence. Injured in his ſight by the conſtant uſe of his teleſcope, and by the nocturnal air, he became blind about three years before his death; and this calamity, which he bore with philoſophical fortitude, prevented his execution of ſeveral plans which he had in contemplation for the improvement of ſcience and the benefit of the world. In 1642 he was ſeized with a diſtemper which terminated his valuable life, in the 78th year of his age.

Galileo was of ſmall ſtature, venerable aſpect, and vigorous conſtitution; his learning was extenſive; the acuteneſs of his wit, and the affability of his temper and manners, rendered him a pleaſant companion. His chief paſtimes were architecture, agriculture, drawing, painting, and muſic.

The light which Galileo caſt upon natural philoſophy by his aſtronomical diſcoveries and mechanical inventions and improvements, aided by his extenſive knowledge of mathematics, entitle him to rank in the firſt claſs of mathematical philoſophers. The following ſketch of his diſcoveries and improvements was drawn by Mr. Maclaurin, a highly competent judge, and we ſhall therefore give it in his own words.

"He made the evidence of the Copernican ſyſtem more ſenſible, when he ſhewed from the phaſes of Venus, like to the monthly phaſes of the Moon, that Venus actually revolves about the ſun. He proved the revolution of the ſun on his axis, from his ſpots; and thence the diurnal rotation of the earth became more credible. The four ſatellites that attend Jupiter in his revolution about the ſun, repreſented, in Jupiter's leſſer ſyſtem, a juſt image of the great ſolar ſyſtem; and rendered it more eaſy to conceive how the moon might attend the earth, as a ſatellite, in her annual revolution. By diſcovering hills and cavities in the moon, and ſpots in the ſun conſtantly varying, he ſhewed that there was not ſo great a difference between the celeſtial and ſublunary bodies as the philoſophers had vainly imagined.

"He did no leſs ſervice by treating, in a clear and geometrical manner, the doctrine of motion, which has been juſtly called the key of nature. The rational part of mechanics had been ſo much neglected, that there was hardly any improvement made in it, from the time of the incomparable Archimedes to that of Galileo; but this laſt named author has given us fully the theory of equable motions, and of ſuch as are uniformly accelerated or retarded, and of theſe two compounded together. He firſt demonſtrated, that the ſpaces deſcribed by heavy bodies, from the beginning of their deſcent, are as the ſquares of the times, and that a body, projected in any direction that is not perpendicular to the horizon, deſcribes a parabola. Theſe were the beginnings of the doctrine of the motion of heavy bodies, which have been ſince carried to ſo great a height by ſir Iſaac Newton."

In

In geometry Galileo has been allowed, on the beſt authority, to be the inventor of the cycloid (ſee CYCLOID): he alſo invented the ſimple pendulum, and made uſe of it in his aſtronomical experiments; he had alſo thoughts of applying it to clocks; but the honour of executing his deſign was reſerved for his ſon Vincenzio, who made the experiment in Venice in 1649; and the invention was afterwards carried to perfection by Huygens. (See CLOCK and PENDULUM.) Galileo alſo invented a machine with which the Venetians render their Laguna navigable.

This excellent philoſopher "alſo diſcovered the gravity of the air, and endeavoured to compare it with that of water, and opened up ſeveral other inquiries in natural philoſophy. He was not eſteemed and followed by philoſophers only, but was honoured by perſons of the greateſt diſtinction of all nations."—"Galileo had ſcholars worthy of ſo great a maſter, by whom the gravitation of the atmoſphere was eſtabliſhed fully, and its varying preſſure accurately and conveniently meaſured, by the column of quickſilver, of equal weight, ſuſtained by it in the barometrical tube. The elaſticity of the air, by which it perpetually endeavours to expand itſelf, and, while it admits of condenſation, reſiſts in proportion to its denſity, was a phenomenon of a new kind, ("the common fluids," as it was then thought, having no ſuch property,) and of the utmoſt importance to philoſophy. Theſe principles opened up a vaſt field of new and uſeful knowledge, and explained a great variety of phenomena, which had been accounted for in an abſurd manner before that time. It ſeemed as if the air, the fluid in which men lived from the beginning, had been then firſt diſcovered. Philoſophers were every where buſily inquiring into its various properties, and their effects; and valuable diſcoveries rewarded their induſtry. Of the great number who diſtinguiſhed themſelves on this occaſion, we cannot but mention Torricelli in Italy, Paſchal in France, Otto Guerick in Germany, and Boyle in England."

The treatiſes written by Galileo were ſo numerous, that we ſhould far exceed our preſcribed limits if we recited all their titles, and their reſpective dates and places of publication. Theſe treatiſes, together with others written by ſome of his diſciples in defence of his doctrines and obſervations, were collected and publiſhed by Menoleſſi, in 1656, under the title of "L'Opere de Galileo Galilei Lynceo, nobile Florentino, &c." in two volumes, 4to. A volume alſo of his "Letters" to ſeveral learned men, and ſolutions of a variety of problems, was publiſhed at Bologna, in 4to. His laſt diſciple, Vincenzo Viviani, a very eminent mathematician, methodized a piece of his maſter's, and publiſhed it under the title of "Quinto Libro de gli Elementi d'Euclide, &c." 1674, 4to.; and he alſo publiſhed ſome other pieces of Galileo's, including extracts from his letters to a learned Frenchman, in which the author gives an account of the works which he intended to have publiſhed, and an extract of a "Letter to John Camillo," a mathematician of Naples, concerning the angle of contact. Many other of Galileo's writings were unfortunately loſt to the world, through the ſuperſtition of one of his ignorant nephews; who, conſidering that his uncle died a priſoner of the holy office, though permitted to reſide in his own houſe, ſuſpected that his papers might contain dangerous hereſies, and therefore committed them to the flames.

Beſides the obligations which aſtronomy, mathematics, and the general knowledge of nature, have had to this great man, which are well known; his inquiries into the propagation, properties, and ratios of ſound; diſcovering the harmonic proportions into which a ſingle ſtring divides itſelf when ſounding; the ſympathy of perfect conſonance, in one ſtring cauſing another to ſound that is tuned in uniſon, octave, or fifth, have been ſo much the means of extending the knowledge of harmonics, by ſubſequent writers, that this great philoſopher as well merits an honourable niche among benefactors to the ſcience, as his father Vincenzio Galilei, among thoſe who have advanced the art of muſic by their labours. Galileo, in his "Diſcorſi e Demonſtrationi Matematiche," treats of the vibrations of ſtrings, harmonies of kindred ſounds, propagation of ſound, and of muſical proportions. The dedication of theſe diſcourſes to the Conte de Noailles, is dated 1638, four years before the author's death. (Opere del Galileo, in Bologna 1655, vol. ii. dial. 1mo. p. 74, et ſeq.) It has long been a received opinion, that Galileo was the natural ſon of Vincenzio Galilei, a Florentine nobleman; but this opinion has lately been confuted by ſeveral Italian writers, particularly Signor Carlo Giuliani, who ſent the late M. Diderot, one of the editors of the Encyclopedie, where the illegitimacy of Galileo is aſſerted, the neceſſary documents to prove that this great philoſopher, born at Piſa February 19th, 1564, was the legitimate offspring of Vincenzio Galilei and Giulia di Corimo Ammanati di Peſcia, his true and lawful wife. See Elogj Italiani, tomo v. Moreri. Hutton's Mathematical Dictionary. Maclaurin's Account of Sir Iſaac Newton's Philoſophical Diſcoveries, b. i. c. 3. Brucker's Hiſtory of Philoſophy, by Enfield, vol. ii. b. x. c. 3. § 3. Gen. Biog.

GALILEO's *Teleſcope*. See TELESCOPE.

GALILEO's *Temperament of the Muſical Scale*.—According to Mr. Overend's MS. in the library of the Royal Inſtitution, vol. i. p. 135, this ſcale had the fifth tempered $\frac{2}{7}$ths of a major comma flat, and the fourth as much ſharp: the major third was $\frac{8}{7}$ths of a comma flat, and the minor ſixth the ſame quantity ſharp: the minor third $\frac{6}{7}$ths of a comma ſharp, and the major ſixth as much flat: the major ſecond or greater tone $\frac{4}{7}$ths of a comma flat, and the major ſeventh $\frac{10}{7}$ths of a comma flat. Such a ſyſtem as this ſeems very inapplicable to practice, to which perhaps it never was ſubmitted, like numerous modern tuning ſchemes.

GALINA POINT, in *Geography*, a cape on the north coaſt of Jamaica. N. lat. 18° 26'. W. long. 76° 41'.

GALINAZZO, a town of Italy, in the department of the Mela; 12 miles N. of Breſcia.

GALINGA, a town of Italy, in the department of the Serio; 16 miles E. of Bergamo.

GALINGEN, a town of Pruſſia, in the province of Natangen; 7 miles S. of Bartenſtein.

GALINHAS, called by the Portugueſe Magualbari, a river of Africa, which runs into the Atlantic. N. lat. 7° 5'. W. long. 11° 15'.

GALIOLA, a ſmall iſland in the gulf of Venice, S.W. of Cherſo. N. lat. 44° 54'. E. long. 14° 20'.

GALIOTE *à Bombes*, Fr. See BOMB-*veſſels*.

GALIPÆA, in *Botany*, a barbarous name formed by Aublet out of the French appellation of the Caribée Indians, Galipons, who call the plant in queſtion *Inga*. Aublet. Guian. 662. t. 269. Willd. Sp. Pl. v. 1. 41. Juſſ. 418. Lamarck Illuſtr. t. 10. Claſs and order, *Diandria Monogynia*. Nat. Ord. uncertain, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, with four or five angles, and as many acute equal teeth. *Cor.* of one petal, longer, regular; tube ſhort, inſerted into a glandular receptacle; limb in four or five deep, oblong, acute, nearly equal ſegments. *Stam.* Filaments four, two of which are ſhort and abortive; two as long as the calyx; all inſerted into the tube of the corolla; anthers oblong, obtuſe, of two lobes and two cells. *Piſt.* Germen ſuperior,

ſuperior, roundiſh, with four or five angles; ſtyle thread-ſhaped, as long as the ſtamens; ſtigma blunt, four-lobed. *Fruit* unknown.

Eſſ. Ch. Calyx inferior, tubular, four or five-cleft. Corolla tubular; limb in five deep ſpreading ſegments. Two ſtamens abortive. Germen ſuperior, angular.

1. G. *trifoliata*, the only ſpecies, is a native of the ſhores of rivers in Guiana. A *ſhrub* four or five feet high. *Leaves* alternate, ſtalked, ternate; leaflets equal, elliptic-oblong, pointed, entire, ſmooth; their veins united in a marginal rib. *Flowers* terminal, corymboſe, ſmall, greeniſh. It ſeems moſt akin to the order of *Vitices*.

GALISANO, Cape, in *Geography*, a cape on the N. coaſt of Spain. N. lat. 43° 28'. W. long. 30° 40'.

GALISPA, a town on the E. coaſt of the iſland of Gilolo. N. lat. 2° 4'. E. long. 127° 50'.

GALISTEO, a town of Spain, in Eſtramadura; 10 miles E. of Coria.

GALITSCH, a town and diſtrict of Ruſſia, in the government of Koſtroma, on the S. ſide of a lake of the ſame name; 56 miles E.N.E. of Koſtrom. N. lat. 57° 56'. E. long. 60° 40'. The lake is about 50 miles in circumference, and communicates with the river Koſtroma by the ſmall rivulet Vara.

GALIUM, in *Botany*, γαλιον of Dioſcorides, from γαλα, *milk*, becauſe the ancients believed it to have the power of curdling that fluid. This is denied by Bergius, Krocker, and Martyn. It is very probable that plants of this genus may, in a paſtoral ſtate of ſociety, have ſerved as ſtrainers for milk, and poſſibly G. *verum*, which is the preciſe γαλιον of Greek writers, may, on account of its yellow flowers, have been thought to communicate a richer colour to it in conſequence. Matthiolus ſays this plant makes the milk ſweeter. Ladies' Bed-ſtraw. Linn. Gen. 52. Schreb. 69. Willd. Sp. Pl. v. 1. 584. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 173. Prod. Fl. Græc. v. 1. 90. Juſſ. 196. Lamarck Illuſtr. t. 60. Gærtn. t. 24. Claſs and order, *Tetrandria Monogynia*. Nat. Ord. *Stellatæ*, Linn. *Rubiaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth ſuperior, minute, of four equal teeth; ſometimes wanting. *Cor.* of one petal, wheel-ſhaped, deeply four-cleft, acute; tube ſcarcely any. *Stam.* Filaments four, awl-ſhaped, inſerted into the corolla, ſhorter than the ſegments; anthers ſimple. *Piſt.* Germen of two grains; ſtyle thread-ſhaped, cloven half-way down, as long as the ſtamens; ſtigmas globoſe, *Peric.* Two dry, cohering, globoſe berries. *Seeds* ſolitary, large, kidney-ſhaped.

Eſſ. Ch. Corolla of one petal, flat, ſuperior, ſeeds two, roundiſh.

Obſ. Tournefort divided his genus *Aparine* from *Galium*, or, as he writes it, *Gallium*, on account of the roughneſs of the fruit in the former; but this is ſo far from a good generic diſtinction, that it proves, in ſome caſes, not a permanent ſpecific difference, at leaſt ſo far as hairineſs is concerned. Several ſpecies differ permanently in the kind of roughneſs which cover their fruit. The genus, however, ſtill ſtands divided in books into ſpecies with a ſmooth fruit, and others with a hairy or briſtly one. Perhaps a better diſtinction would be between an even and a tuberculated fruit.

The habit of this genus is very ſlender; the ſtems herbaceous, acutely quadrangular, oppoſitely branched, very brittle, except the central woody part, which is tough and elaſtic. Leaves whorled, from four to eight or more in each whorl, linear inclining to obovate, rarely elliptical, never ovate; their margins entire, often revolute. The angles of the ſtem, and ribs, edges, and ſurfaces of the leaves, are often beſet with hooked prickles, and very excellent ſpecific marks are ſometimes to be diſcovered in the different directions of theſe prickles on the ſeveral parts of the leaf. The root is ſmall, either fibrous or creeping, in moſt inſtances perennial, ſometimes red like Madder. Flowers white, yellowiſh, or dull red, in terminal, forked, occaſionally axillary, panicles or tufts. Corolla ſometimes awned.—Willdenow diſtinguiſhes 50 ſpecies of *Galium*. In the Prodromus Fl. Græcæ are 21, comprehending ten new ones not known to Willdenow. The Flora Britannica has thirteen, all of which are figured in Engl. Bot. except. G. *Witheringii*; and to which is to be added G. *Spurium* of Linnæus, Engl. Bot. t. 1871, recently found in Scotland by Mr. George Don. The genus is principally European.

The Galium Aparine is common in cultivated ground and hedges, producing its flowers from June till September. This ſucculent plant has no ſmell, but to the taſte it is bitteriſh, and ſomewhat acrid. Dioſcorides mentions an ointment made of the bruiſed herb, mixed with lard, as an uſeful application to diſcuſs ſtrumous ſwellings; and Gaſpari, an Italian, ſucceſsfully adopted a ſimilar practice. He alſo informs us, that a decoction of the plant, employed as a fomentation, was found very efficacious in ſwellings of the glands of the neck, which followed a certain epidemic at Verona.

Dr. Cullen, however, tried the aparine in glandular indurations without advantage. Mayerne ſays, that three ounces of the juice of the plant, taken twice a day in wine, were experienced to be an uſeful arcient and diuretic in incipient dropſies. But the character, in which the aparine has of late been chiefly eſteemed, is that of an antiſcorbutic; for which purpoſe a tea-cup full of its expreſſed juice is to be taken every morning for nine or ten days. When the dried plant cannot be procured, it may be uſed in a dried ſtate as tea.

Other ſpecies of Galium have been uſed medicinally, eſpecially the G. verum, or yellow lady's bed-ſtraw, the flowers of which have been recommended in hyſteric and epileptic complaints. Theſe flowers, as ſome have aſſerted, contain an acid which coagulates milk; but neither Bergius, Cullen, nor Young, obſerved this effect, after repeated trials. Woodville's Mat. Med.

GALL. See Liver.

Gall, in the *Materia Medica*. The depurated liquor of gall has been eſteemed one of the greateſt of all remedies for freckles in the face: the manner of uſing it is this; mix together equal parts of it, and of oil of tartar per deliquium: to a dram and a half of each of theſe, add an ounce of river water, mix them well by ſhaking, and keep them in a vial well ſtopped: the end of the finger being wetted with this, is to be touched upon the freckled part, and this repeated three or four times a day, letting it dry on; at length the part will look red, and there will be a ſort of tickling ſenſation felt in it; and after that, the ſkin will become ſcurfy, and both that and the freckles will fall off. If this does not ſucceed the firſt time, it is to be repeated, and it will clear the face for ſix or eight months, at the end of which time it is to be uſed again. Mem. Acad. Par. 1709.

The gall of divers animals has been recommended for divers uſes, but moſt of theſe are now reckoned fabulous and unfounded.

With us theſe fluids are employed only for external purpoſes; a mixture of ox-gall with camphorated ſpirit of wine is ſaid to be an uſeful embrocation for ſprains, bruiſes, rheumatic pains, &c.

GALL-*ſtones*. See BILIARY *Calculi*.

GALL, in *Mining*, is one of the many names for a *fault*, which ſee.

GALLS, in *Vegetable Phyſiology*, are morbid excreſcences, originating from the moſt vigorouſly growing parts of plants, in conſequence of the attacks of inſects, chiefly of the Hymenopterous order, and of the genus *Cynips*. The parent inſect is provided with a ſharp ſting, ſerving to perforate the branch, leaf, or bud, in which its egg is to be depoſited, and in ſome caſes the puncture made is very deep. As ſoon as the egg is hatched, the young larva or maggot, ſtimulating the vital principle of the plant, cauſes the part in which it is lodged to aſſume a great degree of luxuriance, diſplayed in various whimſical excreſcences, foreign to the nature of the plant in itſelf, but each appropriated to the particular kind of inſect from whoſe operations it ſprings. The original perforation is ſoon cloſed up and entirely obliterated. At length, the maggot having fed on the juices of the plant, copiouſly directed to the injured part, undergoes its changes to a chryſalis, and, finally, to a winged fly, like its parent, when it immediately eſcapes from its confinement by a freſh perforation, and the gall, being left empty, ſoon dries or hardens. The main ſtems of ſome of the large ſhrubby kinds of Hawkweed, *Hieracium ſabaudum* and *umbellatum*, are often thus ſtung, and ſwell into oval knots, in which, while growing, young inſects may be found latent. The two Britiſh ſpecies of Oak bear ſeveral different kinds of Gall, as the light ſpongy bodies vulgarly named oak apples, growing from the ſtalks of the leaf or flower, or from the young twigs; and a red juicy berry-like excreſcence, reſembling a cranberry, from the leaves, which is well figured, with its inſect inhabitant, in Roeſel's work on the transformations of that tribe of animals. The aſtringent galls brought from the Levant for the purpoſes of dyeing and making ink are the produce of an oak, whoſe ſpecies is not very clear to us, nor have we ever had an opportunity of ſeeing this ſort of gall, uſually termed the Aleppo Gall, in a recent ſtate, but its natural hiſtory is well explained, with a plate, in Olivier's Travels. Mr. Arthur Aikin, in his valuable Dictionary of Chemiſtry, charges naturaliſts in general with having, without enquiry, taken up ſuperficial and erroneous ideas of Galls, and particularly of this Aleppo kind, which latter he ſeems inclined to prove a ſort of ſeed-veſſel. He probably had not ſeen the work of Olivier, which ſhews it to be the excreſcence of an oak, and conſequently quite independent of the true and indubitable ſeed of that tree, the acorn; nor, from the wide and indiſcriminate cenſure thrown by Mr. Aikin on naturaliſts in general relative to this ſubject, can he have peruſed the pages of Reaumur, Roeſel, and others, which are models of clear and practical information reſpecting the origin, growth, and appearance of various ſimilar productions. What may have miſled the judgment of this acute and liberal writer in the dried Aleppo galls, we have not at preſent materials to determine; nor ought much ſtreſs to be laid on the appearances of bodies in ſo unnatural a ſtate, whether they may have ſuffered merely from keeping, or whether, as we have ſome ſuſpicion, they may occaſionally have undergone the operation of baking. In either caſe the appearance and condition of the young animal within may well be altered; nor is it any objection to the prevailing theory of its introduction into the plant, that the original perforation, made by the parent in laying the egg, is no longer to be traced. So great a change in the neighbouring parts takes place, that this perforation is very ſoon obliterated in all the common galls that we have examined.—Several galls are found on Willow and Poplar leaves; but the moſt remarkable excreſcence of this kind is the Bedeguar, or moſſy ball found on the Dog-roſe of our hedges, each ſpecimen of which lodges internally numerous maggots of the *Cynips Roſæ*, which, when they arrive at their winged ſtate, eat their way out. After this, and not before, various perforations may be found in the Bedeguar, which ſoon afterwards withers and dries. Analogous to this ſort of Gall, is one obſerved by the writer of the preſent article on Willows in Provence, which branches out like a moſs, or tufted Lichen. Nor is the roſaceous expanſion at the end of each branch of the Roſe Willow, *Salix Helix*, at all different in nature, though unlike in ſhape. Both theſe laſt-deſcribed are permanent, though withered, on the twigs, long after all the proper leaves are fallen. More akin to the galls of the Oak are thoſe of ſeveral Sages in the Levant, *Salvia pomifera*, *triloba*, and *officinalis*, which reſemble little apples, and are ſold in the markets of Crete in particular, being eſteemed a delicacy when prepared with ſugar. It is remarkable that the production of galls cauſes ſuch a change in the ſecretions of the parent plant in thoſe parts, as always tends to the generation of acetous acid, or more eſpecially of the aſtringent or tanning principle. Their colour is conſequently more tinged with red than the neighbouring parts; at leaſt this appears in the Bedeguar, the ſmall galls on willow and oak leaves, and more or leſs in many other inſtances. Some bodies of the nature of galls lodge in one common cavity a multitude of growing inſects, witneſs thoſe remarkable ones, as big as the finger, found in the ſouth of Europe on the Maſtic-tree, *Piſtacia Lentiſcus*. Theſe are very red, of a coriaceous texture, and ſwarm internally with the *Aphis Piſtaciæ* of Linnæus. The red ſwellings on a peach or nectarine leaf, though they have no cavity ſhut up from the external air, as we believe, is completely the caſe with thoſe of the Maſtic, bear a conſiderable affinity to galls, the leaf being greatly diſeaſed, tumid, diſcoloured, and ſwarming with *Aphides*, whoſe ſtimulating action appears to cauſe its morbid ſtate. S.

Galls, with regard to their medicinal uſe, are found to be very aſtringent, and good under proper management in diarrhœas, dyſenteries, and hæmorrhages of all kinds; and applicable to the ſame indications as the oak-bark. They have alſo a great virtue as a febrifuge, and are often found to cure an intermittent. Their efficacy in intermittent fevers was tried by Mr. Poupart, by order of the Academy of Sciences, and from his report, it appears, that the galls ſucceeded in many caſes; and alſo that they failed in many other caſes, which were afterwards cured by the Peruvian bark. (Mem. pour l'An. 1702.) In fevers half a dram or more of the powder of Aleppo galls may be given for a doſe. They are alſo uſed externally as a ſtrengthener and aſtringent: a decoction of them is applied with ſucceſs by way of fomentation in *procidentiæ of the anus*, and has been injected in the fluor albus with great ſucceſs. As they poſſeſs a greater degree of aſtringent and ſtyptic power than the oak-bark, they ſeem to have an advantage over it, and to be better ſuited for external uſe. Reduced to fine powder, and made into an ointment, they have been found of great ſervice in hæmorrhoidal affections. Cullen, Mat. Med. vol. ii.

Galls may be made a very uſeful teſt for iron in the ſeveral ſpecies of vitriols; for it is certain that an infuſion of galls will become black with a ſolution of any vitriol that contains iron, and not at all ſo with ſuch as contain only copper, as the common blue vitriol and the like.

Dr. Lewis obſerves, that if a decoction or infuſion of galls

galls is dropt into a ſolution of this vitriol largely diluted with water, the firſt drops produce blueiſh or purpliſh red clouds, which mingling with the liquor, tinge it uniformly of their own blueiſh or reddiſh colour. With diſtilled water, or the common ſpring waters, the mixture is always blue; but if the ſmalleſt portion of alkaline ſalt be diſſolved in the water, or if the water is in the leaſt degree putrid, the colour produced will be purple or reddiſh. If more of the aſtringent infuſion be added to the blue or purple liquors, they will deepen to a black, which will be more or leſs intenſe according to the degree of dilution: and the colouring matter may be ſeparated from the liquors, unleſs they are of a full blackneſs, by dilution with water and depoſition. The ſeparation may be retarded or prevented, as is done in the preparation of ink, by adding ſome mucilaginous matter, as gum arabic. This coloured matter is evidently a ferruginous precipitate; for, although it cannot be attracted by a magnet, this property may be given to it by a ſlight calcination. This precipitate is ſoluble by acids, as in the caſe of inks, whoſe colour is hereby deſtroyed, but it may be reſtored by the addition of alkalies. Lewis's Com. Phil. Techn. p 344, &c. See the next article.

GALL-*nut*, in *Chemiſtry*.—Of the great variety of gall-nuts, two in particular are well known as extenſive articles of commerce, *viz.* the common, and the Aleppo gall-nut. The former is brought from the ſouthern parts of Europe, and the latter from Aſia Minor and particularly Syria, and both are the produce of the prickly-cupped oak. (Quercus cerris, Linn.) Theſe two alone have engaged the attention of chemiſts. We ſhall preface the reſults of their enquiries with a deſcription of the gall-nut itſelf of each kind, extracted principally from Aikin's Chem. Dictionary.

The Aleppo gall-nut is a round body of an olive green colour. It is hard and heavy, and frequently exhibits ſmall protuberances on its ſurface. When broken it is found to conſiſt of four diſtinct parts, which admit of being ſeparated. The external, or cortical covering, is of a cloſe fibrous texture and very thin; it is highly aſtringent to the taſte. The part that immediately follows is very ſimilar to reſin, both in its fracture and luſtre; its colour is dark yellowiſh brown, it is very brittle, and its taſte is nauſeouſly aſtringent and bitter; on a red hot iron it becomes black, exhales a peculiar odour in great abundance, conſumes without flame like the cortical covering, and leaves a little aſhes. It is bounded on the interior by a pale yellowiſh brown ſhell, which has many of the properties of ligneous fibre. This ſhell encloſes, when the gall-nut is found, an oval kernel of about a quarter of an inch in length, of a brown cream colour, or if mouldy, of a bright chocolate; it is inſipid unleſs chewed, then a faint ſweetiſh flavour is perceived, which has been compared to that of a bad almond.

The common gall-nut differs conſiderably from the preceding, and is eaſily diſtinguiſhed. It is of a yellowiſh colour, not ſo heavy as the Aleppo gall, nor poſſeſſed of the ſame reſinous fracture, it is alſo larger, being about the ſize of a nutmeg, leſs aſtringent, and not capable of making equally good infuſions with water, on which account it is much leſs valued.

For our chemical knowledge of the gall-nut, we are principally indebted to the labours of Scheele, Deyeux, Seguin, Prouſt, and Davy. Scheele diſcovered that the gall-nut contains gallic acid; M. Deyeux, in an elaborate memoir, pointed out the effects of a variety of re-agents on the infuſion, and ſhewed that it contained extractive matter. M. Seguin aſcertained the exiſtence of tannin, as a peculiar principle, and found that it entered into the compoſition of the gall-nut; Mr. Prouſt made known ſeveral curious particulars on the mode of ſeparating the tannin from the other ingredients of this ſubſtance, &c. And Mr. Davy greatly increaſed the general ſtock of information, to which other chemiſts have likewiſe contributed, by many additional new facts, and by minutely examining thoſe before made public.

The chemical hiſtory of the gall-nut is ſo intimately connected with that of tannin, that to treat the ſubject at full length, would be to break in upon the latter article, which being of more importance requires to be more fully diſcuſſed; we ſhall therefore only deſcribe the general properties of the ſubſtance in queſtion, and refer our readers for farther information to the article TANNIN.

Pounded gall-nuts treated with water form a deep brown coloured infuſion; ſeveral portions of water are neceſſary to exhauſt all the ſoluble matter, and what remains after the water ceaſes to act appears very analogous to woody fibre. The laſt infuſions obtained, though apparently they poſſeſs the ſame properties as the firſt, differing only in degree, frequently have a green colour. This colour, which is attributed to the preſence of gallat of lime, is deſtroyed by the nitric and oxy-muriatic acid, and is changed into red by the addition of a few drops of ſulphuric acid. On account of the variable proportions of the ſoluble matter in different gall-nuts, there is ſome difficulty in making uniform infuſions; the beſt method is to macerate the gall-nuts, finely powdered, in ten times their weight of cold water, for 24 hours. Infuſions made with boiling water are generally turbid, and therefore unfit for delicate experiments. The ſuſpended matter that occaſions this turbidneſs cannot be ſeparated by frequent filtrations, but in time it gradually ſubſides and leaves the infuſion tranſparent. The ſtrongeſt infuſion that can be made at 56° Fahrenheit, is of the ſp. gr. 1.068. It is of a yellowiſh brown colour, and ſemi-tranſparent. To the taſte it is exceſſively aſtringent, and it ſtrongly reddens vegetable blues. Alcohol, when added to it, occaſions no precipitate, but ſometimes a ſlight turbidneſs; hence it may be inferred that little or no mucilage is preſent. The red ſulphat of iron gives a deep black precipitate indicating the preſence of gallic acid; a ſolution of gelatine forms a copious precipitate indicating tannin; and muriat of alumine and oxymuriat of tin throw down a precipitate which, it is generally conceived, denotes extract. From this knowledge of the component parts of the infuſion, it is eaſy to conceive its effects on re-agents, and the facts which have been diſcovered reſpecting its agency will agree with this compoſition. Thus, as it might be inferred, a precipitate is produced in the infuſion by the ſulphuric, muriatic, and dilute nitric acids, and a decompoſition without a precipitate by the oxymuriatic acid and concentrated nitric acid. The cauſtic alkalies render the infuſion of a browniſh red colour; but in their carbonated ſtates they produce immediate precipitates. The alkaline earths, either pure or in combination with carbonic acid, ſeparate moſt of the conſtituent parts of the infuſion, forming compounds poſſeſſed of little ſolubility; magneſia and alumine have the ſame effect; but the reſults in all theſe inſtances greatly depend on the proportions uſed, and the time allowed for the reſult; when the earths are in large quantities, they ſeparate almoſt the whole of the tannin, gallic acid, and extract, but when their quantity is ſmall, the principal part of the gallic acid remains in ſolution, combined with part of the earth employed, forming a ſuper-gallat. Generally either the ſolid compound formed, or the ſuper-natant liquor is of a green colour, and the latter does not precipitate gelatine, unleſs an exceſs of acid be preſent. The oxyd of zinc and tin, when boiled in the infuſion, renders the water pure. Several neutral ſalts occaſion a precipitate, when

added

added ſeparately to the infuſion. This effect is produced by ſulphat of lime and alumine, by nitrat and acetite of potaſh, and by muriat of ſoda and barytes. Theſe compounds are to a certain extent ſoluble in water, and their ſolutions precipitate gelatine. Mr. Davy conceives that they contain, beſides tannin, a portion of gallic acid, and extract in union with part of the ſalt itſelf. He is of opinion, too, that the precipitates which moſt metallic ſalts afford with an infuſion of galls, are of a ſimilar nature.

When the infuſion is ſlowly evaporated it becomes turbid, and depoſits a matter ſimilar to extract, which may be moulded when warm like wax, but when cold is brittle. It is remarkable, that if a freſh infuſion is made with the reſidue evaporated to dryneſs, this infuſion on a ſecond evaporation depoſits more extract, and if the treatment is ſeveral times repeated, the ſame effect is produced.

When gall-nuts are diſtilled with water, at a heat below its boiling temperature, the water comes over pure; but when the temperature is raiſed a little above 212°, a liquor is received that contains, beſides a ſmall portion of gallic acid, a conſiderable quantity of acetic.

When gall-nuts are diſtilled in a retort at a temperature very ſlowly raiſed from 212° to a red heat, carbonic acid in great abundance is conſtantly produced; the firſt fluid that condenſes in the receiver contains much gallic acid; the next product is ſublimed gallic acid; and the laſt is a liquor, which is a mixture of a lemon coloured fluid, of a light oil of the ſame colour, and of a heavy empyreumatic oil. The laſt portions of carbonic acid gas are mixed with carburetted hydrogen. The reſidual coal is very black and retains ſtill, imperfectly, the form of the galls.

When the diſtillation is carried on with a heat more rapidly raiſed, the reſults are very different. A much larger quantity of carbonic acid gas is evolved, no gallic acid ſublimes, the liquid products are more coloured, and the carburetted hydrogen is produced in greater plenty.

Reſpecting the compoſition of the gall-nut, different opinions are entertained; that adopted by the moſt approved writers is, that it is a compound of tannin, gallic acid, mucilage, extract, and an inſoluble matter, ſimilar to woody fibre. It is certain that the ſubſtances, to which theſe names have been applied, can be extracted from the gall-nut; but the exiſtence of theſe ſubſtances themſelves, as peculiar principles, has lately been queſtioned. Thus M. Bouillon La Grange conſiders gallic acid as a combination of acetic acid and tannin. M. Thenard maintains that tannin is a compound of gallic acid and vegetable matter; and Dr. Boſtock and Mr. Murray are doubtful reſpecting the propriety of admitting tannin and extract as two diſtinct principles. We ſhall not here enter into a diſcuſſion of theſe gentlemen's views; the two firſt, for the preſent, may be oppoſed to each other, and the juſtneſs of all of them can only be determined by future experiments. The ultimate parts of the gall-nut are the ſame as thoſe of all other vegetable ſubſtances; *viz.* carbon, oxygen, and hydrogen; the earths, which it ſometimes contains, appear to be adventitious, and to depend on the nature of the ſoil on which the nut-gall is produced.

For the only analyſis of the gall-nut we are indebted to Mr. Davy. He found that 500 grains contain 185 grains of ſoluble matter, which were compoſed of

Tannin	130 grs.
Mucilage, rendered inſoluble by evaporation	12
Gallic acid and a little extract	31
Remainder, lime and ſaline matter	12
	185

For the uſes of the gall-nut, ſee the articles DYEING and INK. Annales de Chimie, tom. xvii. p. 1, and tom. lx. p. 173. Philoſophical Tranſactions, 1803, p. 239.

Theophraſtus, Dioſcorides, Pliny, and other writers of antiquity, mention the gall-nuts of Syria as being of ſuperior quality, and ſtill at the preſent day thoſe that are brought from the Eaſt are preferred to all the reſt. The principal places from which this valuable article of trade is exported to Europe, are Aleppo, Tripoli, Smyrna, and Said; particularly the firſt of theſe places, to which the gall-nuts are brought from Moſul, ſituated on the weſtern bank of the Tigris, about 10 days' journey from Aleppo. The real Moſul gall-nuts are unqueſtionably the beſt of all; but, according to Dapper, all thoſe gathered farther in the interior of the country, near the river Tigris, and towards Perſia, near Sahrozour, Gibel, Summanſu, and Serty, are equally known by the name of Moſul gall-nuts. The trade of this article is entirely in the hands of the Curdes, who reſort to Aleppo from September to May. Thoſe gall-nuts that come lateſt are generally ſuppoſed the beſt. An inferior kind is that ſold at Said; but of the worſt quality are thoſe which are carried from Caramania to Cyprus.—The Levant gall-nuts differ from thoſe of Europe in being on the whole ſmaller, much more compact and heavy, in having a more tubercular, and almoſt prickly ſurface, and in their blackiſh colour, which often ſhows a tinge of greeniſh or bluiſh. Thoſe that are light-coloured, yellowiſh, and whitiſh, which is not ſeldom the caſe with thoſe of Cyprus, are held in little eſtimation; they contain leſs aſtringent matter; as is ſaid to be likewiſe the caſe with thoſe furniſhed with a hole, and which were gathered after the inſect had pierced through its incloſure.

The reaſon why the Levant gall-nuts are of ſuperior quality to the European does not appear to be well underſtood. Perhaps the inſect which produces them is a ſpecies of cynips different from ours; perhaps, too, the warmth of the climate of the eaſtern countries promotes the concoction of the ſpecific juice, which is ſecreted after the puncture made by the inſect. Several authors have ſuppoſed that the Levant gall-nuts are produced by an oak ſpecifically different from ours; according to Bergius, Cullen, and Murray, it is *Quercus Cerris*; while others have thought *Q. Ægylops* to be the ſpecies. It is, however, well known, that both theſe ſpecies are alſo found in Spain and in ſome parts of the ſouth of Europe.

The bluiſh gall-nuts are the higheſt in price, and next to them thoſe of a greeniſh colour from Smyrna. The whitiſh ſort is the cheapeſt; a circumſtance of which impoſtors avail themſelves to increaſe their value by dyeing them blue. The deceit is, however, detected by the deeper tinge of blue of theſe artificial productions, as well as by the hole which is generally found in the white ſort.

A particular kind of gall-nuts is known in Germany by the name of *knoppern* or *knobben*, of which an account has been lately given by profeſſor Beckmann. They are probably not unknown in this country; but we have not been able to learn by what name they paſs among the traders in this merchandize. They are not, like the common gall-nuts, nearly globular, but irregularly angular and amorphous, and are larger, and more compact than even the Aleppo nuts. The beſt are ſaid to come from Natolia; and Beckmann ſuppoſes that theſe are mentioned by writers under the Turkiſh name of *bazgende*, and as now and then occurring among the gall-nuts from Aleppo. The eaſtern nations, excelling in the arts of tanning and dyeing, uſe them, for both theſe purpoſes, in preference to the real gall-nuts, which are far inferior in ſtrength. From the Levant they found their way into Italy, and from thence to Vienna. Afterwards, when, on

account of the great demand for this article, it roſe conſiderably in price, and ſubſtitutes were accordingly ſought after, it appeared that the ſame *knoppern* were likewiſe found in abundance in the extenſive oak-foreſts of Hungary, Moravia, Croatia, and particularly of Sclavonia. Formerly, the farmers and foreſters of thoſe countries, who principally ſubſiſted by the breeding of hogs in their foreſts, were wont to conſider the frequent occurrence of thoſe excreſcences as a calamity, ſince, when they appeared in abundance, the crop of acorns was conſiderably diminiſhed; but they ſoon found that the profits ariſing from the ſale of this new article of trade far ſurpaſſed that derived from the acorns, for which neceſſity ſoon pointed out a ſubſtitute. In the year 1774, the juſt-mentioned provinces obtained permiſſion to export this article by ſea to the Auſtrian harbours in the Mediterranean. Since that time, the price of the knoppern has been fluctuating. In 1780, the kübel, being two Preſburgh buſhels, ſold for 17 florins; but ſoon after it fell to five and two florins the buſhel; and in 1783, the price was as low as from four to ſix groſchen a buſhel. In Hungary, they are found moſt abundantly in the Bakony foreſt, and the principal market for them is Fünfkirchen. Before they are uſed, the knoppern are pounded in fulling-mills.

When this new article of commerce was firſt diſcovered, it was generally ſuppoſed to be the work of the ſame inſect which produces the gall-nuts, but the oak was conſidered as a different ſpecies. Later obſervations, however, have proved that there is no difference in the oak, which is the common ſummer oak with elongated pedicles. What is equally certain is, that the inſect from which the knoppern originate is a diſtinct ſpecies of cynips: it depoſits its eggs in the germen or young fruits, and by this means an excreſcence is formed, which often covers the whole cup and acorn. Owing to the preſſure thus cauſed, the fruit is generally prevented from developing itſelf, and therefore remains in a dwarfiſh ſtate.

As a ſubſtitute for gall-nuts, the ancients, as appears from Paulus Ægineta, made uſe of the cups of acorns as well for the purpoſes of medicine as for tanning: and they are ſtill uſed in Italy, from whence, in latter times, they have found their way into Germany and France. They are imported from the Greek iſlands, Chios, Zia, Cyprus, and Samos, (which latter, on account of its oak-foreſts, was formerly called Δρύσα), but particularly from Smyrna, and the neighbouring ſmall harbours of Vourla and Segigiek, from whence alone 50,000 cwt. are ſaid to have been annually exported to Venice and Ancona. When, in 1779, the knoppern failed, a merchant of Vienna cauſed upwards of 1200 cwt. of acorn cups to be ſent from Smyrna, which he ſold with great advantage. Theſe cups, and the acorns they contain, are the largeſt of any we know; the former are about two inches in diameter, are woolly within, and furniſhed with woody ſcales on the external ſurface. The acorns are about two inches long, and almoſt entirely encloſed by the cup, ſo that the top only is viſible, which exhibits a kind of depreſſed umbilicus. The ſpecies of oak which furniſhes theſe cups is, according to the beſt accounts we poſſeſs, *Quercus ægylops*: the modern Greek denomination is *Velani*, a corruption of the Βαλανος of the ancient Greeks; whence Labat is miſtaken in deriving this name from that of Valone, a place on the eaſtern coaſt of the Adriatic, where this oak is ſaid to be found in abundance.

GALLS, *Box*, in *Natural Hiſtory*, the name given by authors to a very ſingular kind of galls, of a conic figure, with a conic top, or cover reſembling a wooden box, and encloſing a white worm in the manner of the other vegetable lodgments of the ſame kind; this ſort of gall is found only on the leaves of the lime-tree. Reaumur.

GALLS, *Bramble*, a ſpecies of galls found on the branches of the common wild bramble. Theſe are often no other than tumefactions of the ſtalk, for the ſpace of an inch, or thereabout, which ſometimes form only ſo many thick cylindric pieces; at other times they are of the ſhape of an olive, and ſometimes they affect only one ſide of the branch: in all caſes, however, the tumid part, or gall, is much harder than the other parts of the branch, which are in their natural ſtate. They are inhabited by a great number of worms of an oblong figure, and yellow colour, which have a ſharp point of a brown colour, and of the hardneſs of iron, proceeding from the extremity of the head, with which they tear and break the woody fibres, and near its end there is a ſlit, which is the mouth of the creature, and ſerves for receiving and conveying into the ſtomach the fragments of wood which it breaks with the point. Reaumur.

GALLS, *Broom*, a ſpecies of galls found on the Geniſta vulgaris, or common broom. This gall is found to contain a ſmall oblong worm, of a red colour; and too ſmall to be ſeen diſtinctly without a glaſs.

GALLS, *Lime*. See LIME.

GALLS, *Muſhroom*. See MUSHROOM.

GALLS, *Gooſeberry*. See GOOSEBERRY.

GALLS, *Grape*. See GRAPE.

GALLS, *Roſe*. See ROSE and GALLS.

GALLS, *Willow*. See WILLOW.

GALL, *Wind*. See WIND.

GALL-*inſect*, in *Natural Hiſtory*, the name of a claſs of inſects, ſo called from their reſemblance to ſmall galls or vegetable protuberances of a like kind upon trees. They are indeed ſo like theſe ſubſtances, as to have been by many miſtaken for them, and thought not of the animal, but of the vegetable kingdom. Theſe inſects paſs a very great part of their life, even many months together, faſtened againſt the leaves and ſtalks of plants, without any appearance of life or motion, and this is the time in which they acquire their ſtated growth. They are in this ſtate as immoveable as the branch they are fixed on, and ſeem to make a part of it. Their exterior form is remarkably plain and ſimple, and the more the creature increaſes in growth, the leſs appearance of life it ſhews; and even when it has acquired its maturity, and is in a condition to depoſit its eggs for the propagation of its ſpecies, it then appears leaſt of all of an animal form, and more, than in any other ſtate, reſembles a gall, or ſuch vegetable protuberance. Not only the vulgar and incurious have been deceived by this appearance, but the accurate count Marſigli, among others, after very attentively examining the gall-inſects of one ſpecies, remained ſeemingly convinced that they were real vegetable excreſcences. (See CYNIPS.)

They are uſually found on the ſtalks and branches of trees, ſhrubs, and perennial plants. They are very various in ſize, ſhape, and colour.

Theſe creatures have ſo little to attract the obſervation even of the curious, that they might probably have remained much longer unregarded, were it not that they multiply ſo exceſſively faſt on ſome fruit-trees. The peach-trees, in particular, are ſometimes in a manner covered with them, and theſe of more than one ſpecies; ſome of the globular kind, and others of the boat figure. The branches thus covered look rough and ſcabby, and the gardeners, ſenſible that whatever the things were, they muſt be nouriſhed at the expence of the juices of the tree, have attempted to deſtroy them. The leaves and fruit of theſe trees are often blackened by the wet that has run off from theſe inſects; and our orange-trees, which are frequently full of them, firſt ſtirred up the attention of the more careful obſervers of them to clear them away: theſe are principally of that kind,

whoſe form is that of the inverted boat. Meſſrs. de la Hire and Sedilieau were at the pains of making a ſet of obſervations of a very curious kind concerning them; theſe gentlemen call this ſpecies the orange-tree-bug, a name by which the gardeners alſo call them, though they have nothing in common with any known ſpecies of that animal. See the Memoirs of the Academy of Paris, 1692. If many of the ſpecies of theſe little animals, however, do miſchief to our fruit-trees, there are ſome other kinds of them, the value and uſe of which may very well make us amends; ſince it is from one ſpecies of theſe little creatures that the inhabitants of many places make ſuch great gains, gathering a harveſt of them without the trouble or expence of ſowing or cultivating. The kermes, ſo well known by name, though ſo little truly underſtood, is of this kind, to which both the phyſician and the dyer are ſo greatly obliged. Reaumur's Hiſt. Inſects, vol. iv. p. 1.

Dr. Liſter was, perhaps, the firſt diſcoverer of the gall-inſect and progal inſect claſſes: he found theſe animals on the plum, cherry, vine, laurel, and many other trees, and calls them *patellæ* of theſe trees. He was well apprized of their animal origin, and in the year 1671 diſcovered that ſome of them would ſtrike a carnation-red colour, with ley of aſhes, which was not only a good but a permanent tinge. The principal kind of which he made the experiment was the ſemiglobular ſort, which he deſcribes as being entirely round, except when they are applied to the tree. They were of the ſize of half a large pea, of a cheſnut colour, and of a ſhining ſurface, faſtening themſelves to the bark of the tree, as the limpets do to the rocks, and were generally ſought after by ants and other vermin.

GALL, *Peach-inſect.* See PEACH.

GALL, *Shell-inſect.* See SHELL.

GALL, *Vine-inſect.* See VINE.

GALL-*inſect fly*, the male of the gall-inſect ſpecies. It is a two-winged fly of a very particular kind. There ſeems a great reſemblance between theſe flies in all the gall-inſect claſs, and that of the peach-gall-inſect may give a proper idea of all the reſt. This little creature, examined with the help even of the beſt glaſſes, ſhews, on the under part of its head, nothing analogous to the organs of other flies, deſtined to convey their nouriſhment; nothing that at all reſembles the trunks of the other two-winged flies, nor any thing that can be compared to teeth. Where the teeth, if any, ought to be placed, nothing is to be ſeen but two hemiſpheric, or more than hemiſpheric bodies, black and ſhining, and in all reſpects reſembling eyes. If theſe are eyes, they are very remarkably ſituated; and juſt over againſt them, on the other ſide of the head, and near the baſes of the antennæ, there are two other ſimilar bodies, which indeed cannot be taken for any thing but eyes. It ſhould ſeem that this fly has therefore no organs to receive aliments, but has two eyes in the place of ſuch.

The want of theſe organs is nothing ſingular in the inſect world, ſince the moths and butterflies afford us inſtances of it. Many of theſe may be ſeen, as ſoon as produced from their chryſalis, in a ſtate to propagate their ſpecies, and depoſit their eggs; and this great end atchieved, they have no farther occaſion for life, nor any means for its ſupport; and probably the caſe is the ſame with theſe flies, which, as ſoon as looſe from their ſhell, ſeek out and fecundate the females, and have after this no farther uſe for life. It is another ſingularity in this ſpecies, that they are produced from their ſhell by their hinder part firſt, whereas all other ſpecies of the two-winged flies are produced with the forepart of their body firſt; and if we cannot ſay what may be the reaſons for this ſingularity in the production of this fly, we can however eaſily perceive that every thing is prepared and deſtined accordingly for it. In the nymphs of other flies, all the legs are conſtantly applied cloſe to the body, whereas, on the contrary, in the nymph of the gall-inſect fly, the legs placed next the head, or the firſt pair, are conſtantly ranged upward, and each of them embraces one ſide of the head; the conſtant poſition of theſe legs in this direction is a proof that it is the order and courſe of nature in the production of the animal; nor is it without reaſon that they are thus placed in a ſpecies which, contrary to all others, is to force itſelf backward out of its ſhell, ſince they ſerve very properly for the creature to puſh himſelf backward by: and as the anterior part of the caſes of other flies naturally and eaſily opens to give paſſage to the animal, ſo the poſterior part of this does. They ſeem alſo to be more than ordinarily ſlow in their getting out, ſome of them having been obſerved to be ten or twelve hours, from the time of the firſt appearance of a piece of each wing, to their perfect enlargement. Reaumur's Hiſt. Inſect, vol. iv. p. 40.

GALLA, in *Geography*, a town of Arabia Felix; 24 miles S.E. of Taas.

GALLÆ. See GALLI.

GALLAM, GALAM, or *Fort St. Joſeph*, in *Geography*; a town of Africa, and capital of a kingdom called Kajaaga, and by the French Gallam, on the river Senegal. A fort was built here by the French, who ceded it to the Engliſh, by the peace of Verſailles, in 1763; during the American war it was taken by the French, but at the peace of 1783 reſtored to Great Britain. N. lat. 14° 35'. W. long. 10° 50'.

GALLAN, a ſmall iſland on the coaſt of Peru, in S. lat. 14°, 5 miles N. of the high land Morro Vejo, or Old Man's Head, affording between it and the high land an eligible ſtation for veſſels bound for Callao to cruiſe.

GALLAND, ANTHONY, in *Biography*, was born at Rollo in Picardy in 1646; he received the uſual education at the college of Noyon, whence he was taken to be initiated into ſome trade. But he manifeſted ſo ſtrong a turn for literature that it was determined he ſhould proceed to Paris to purſue a regular courſe of ſtudies. His aſſiduity and ſucceſs were anſwerable to the expectations formed of him, and he ſoon became diſtinguiſhed for his knowledge in the oriental languages. He was attached to M. de Nointel's embaſſy to Conſtantinople and the Levant, where he collected a rich treaſure of inſcriptions and drawings of the antiquities of the places through which he paſſed. In 1675 we find him again at Paris intimately connected with Vaillant and other medaliſts, who formed ſo high an opinion of his talents that they engaged him in a ſecond voyage to the Levant. In 1679 he made a third voyage to the ſame place at the expence of the French Eaſt India company, when he perfected himſelf in his knowledge of the principal oriental languages, which qualified him for the office, which he undertook upon his return, of aſſiſtant to Thevenot the king's librarian, and after the death of d'Herbelot he continued the publication of his "Biblioth. Orientale," and wrote a preface to it. At the age of ſixty-three he was appointed royal profeſſor of Arabic; and in the year 1715, he died in the ſeventieth year of his age. He was a learned and induſtrious man, ſimple in his manners, careleſs in the ordinary affairs of life, and zealouſly attached to the ſeveral purſuits in which he engaged. His moſt popular work is his verſion of the Arabian tales, which is well known in every part of the civilized world. He was author of various other pieces tranſlated from the eaſtern languages, and ſeveral papers to be found in the Memoirs of the Academy of Inſcriptions, of which body he was a moſt uſeful and valuable member. He has papers, likewiſe, reſpecting

ſpecting medals and matters of antiquity in other collections. Moreri.

GALLAND, AUGUSTUS, a conſiderable lawyer and hiſtorian of the ſeventeenth century, was a native of France, and roſe to the dignity of attorney-general of Navarre and counſellor of ſtate. He was author of many learned works, but the principal was one, which he wrote againſt the allodial rights pretended by ſome of the provinces, to which he added the laws given to the Albigenſes by Simon de Montfort. He died about the year 1644, and in 1648 his ſon publiſhed as a poſthumous work his Memoirs for the Hiſtory of Navarre and Flanders. A diſcourſe to the king concerning the origin, progreſs, &c. of the city of Rochelle publiſhed without a name in 1628 and 1629 was generally aſcribed to M. Galland. Some years ſince many genealogies of noble families drawn up by this author were to be found in the libraries of France. Moreri.

GALLANT, or GALANT, a French term, ſignifying civil, polite, well-bred; or a perſon of wit and addreſs, who does every thing with a good grace: in fine, a civil perſon, ſomewhat brighter, gayer, and more agreeable than ordinary.

It is difficult to define all the qualities annexed to the idea of a gallant man. It ſometimes implies one who has what the French call the *bon ton*; but it generally means one who has a great devotion for the fair ſex, with the manners adapted to pleaſe them. The French authors are very nice on this point; they diſtinguiſh *galant homme*, and *homme galant*.

GALLANT, *Cape*, in *Geography*, a cape in the ſtrait of Magellan, diſtant about eight leagues from cape Holland: this cape is high and ſteep, and between this and cape Holland lies a reach about three leagues over, called "Engliſh Reach;" about five miles S. of cape Gallant lies a large iſland, called "Charles's Iſland;" and a little to the eaſtward of cape Holland is a fine ſandy bay, called "Wood's Bay," in which there is good anchoring. In cape Gallant bay, which may be entered with great ſafety, there is a fine large lagoon, where a fleet of ſhips may moor in perfect ſecurity; the depth being every where four fathom, with a ſoft muddy ground, and on the eaſt ſide from ſix to ten fathom, where is the beſt anchoring. There is plenty of good watering from two rivers, and plenty of wood. The lagoon abounds with wild fowl, and wild celery; muſcles, and limpets are plentiful. The landing is good. The latitude of the bay and lagoon is 53° 50′ S., and longitude 73° 9′ W.; the variation is two points eaſterly.

GALLANTES, among the Romans, a ſurname given to the prieſts of Cybele; whence the modern terms of *gallant*, and *gallantry*, have been formed. See Mem. Acad. Inſcript. vol. v. p. 427.

GALLAO, in *Geography*, a town of Africa, in Bambarra; 140 miles E. of Sego.

GALLAPAGOS. See GALAPAGOS.

GALLAPAGOS *Rocks*, rocks that lie on the E. coaſt of the iſland of Lucaya. N. lat. 27°. W. long. 77° 10′.

GALLARATO, a town of Italy, in the department of the Olona; 20 miles W.N.W. of Milan.

GALLARDON, a town of France, in the department of the Eure and Loire; nine miles N.E. of Chartres.

GALLATIN, a county of America, in Kentucky, containing 1078 inhabitants, of whom 276 are ſlaves.—Alſo, a poſt-town of Sumpter county, Teneſſee, 714 miles W. by S. from Waſhington.

GALLATON, or GALLOWTOWN, a town of Scotland, in the county of Fife; 15 miles N.E. of Edinburgh.

GALLBRUN, a town of Auſtria; ſeven miles N.W. of Brugg.

GALLE, or *Point de Galle*, a town of Ceylon, conſidered, in point of importance, as the third town on the iſland, and lying about ſixty miles due S. of Columbo, in N. lat. 6° 1′. E. long. 80° 19′ 20″. The fort is ſtrong, and the garriſon generally conſiſts of two or three companies of Europeans, half a company of artillery, and a battalion of native troops. It is commanded by the next ſenior field-officer after the governors of Columbo and Trincomalee. The harbour is ſpacious, particularly the outer road. The inner harbour is ſecure during a great part of the year, and always, except in a S.W. wind; but it has this diſadvantage, that winds from a particular quarter are neceſſary to carry veſſels out. At the entrance, which is narrow, lies a large rock, on which is a ſmall work. The ſurrounding ſhore is rocky and full of ſhoals, dangerous to ſtrangers. Ships outward bound from Europe generally come in ſight of the firſt land at Dondre-head, the ſouthern promontory of Ceylon, and make Point de Galle the firſt harbour. The houſes, both in the town and port, are ſuperior to thoſe of Trincomalee. The whole town is populous, and with reſpect to trade ranks next to Columbo. The coaſt and country about Galle is very mountainous. From the neighbouring heights, Adam's Peak is very plainly ſeen, and ſeveral of the hills in the interior. Fiſheries to a very conſiderable extent are carried on here; and indeed form the chief branch of its traffic. A great number of Malays and natives are employed in catching, curing, and drying the fiſh to prepare it for exportation to different parts of the continent of India. Arrack, oil, pepper, cotton, and cardamoms alſo form a part of its exports. Cinnamon is alſo grown here, but not in ſuch quantity as about Columbo; but in quality it is much the ſame. One of the India ſhips touches here annually, either before or after ſhe has taken in part of her cargo at Columbo, to carry off any cinnamon that is prepared for exportation. Percival's Ceylon, p. 152.

GALLE, a ſmall iſland in the Atlantic, near the coaſt of Braſil. S. lat. 27° 50′.

GALLED, SADDLE. See SADDLE-*galled*.

GALLED, in *Sea Language*, is applied to a maſt, yard, cable, &c. which is chafed and worn by friction. They are uſually covered with ſkins, mats, canvas, &c. in thoſe parts which are the moſt expoſed by the rocking of the veſſel, as a preſervative from this injury.

GALLED *Crops*, in *Agriculture*, are ſuch as have numerous thin ſpots in different parts of them.

GALLEGO, in *Geography*, a town of Spain, in the province of Leon; eighteen miles S.S.E. of Salamanca. —Alſo, a river of Spain, which runs into the Ebro, oppoſite to Saragoſſa.

GALLEGOS, a town of Spain, in Old Caſtile; thirty-five miles N.W. of Avila.

GALLEMBERG, a town of the duchy of Carniola; thirty miles E. of Laubach.

GALLEN, ST. a territory of Switzerland, bounded N. by the lake of Conſtance, and on the S. by the canton of Appenzel. The whole territory of the town of St. Gallen does not exceed a mile and a half in circumference; and including the town contains near 8000 inhabitants. The abbot and town of St. Gallen are both allies of the Swiſs cantons, and each enjoys the privilege of ſending deputies to the general diet. The abbot of St. Gallen is titular prince of the German empire, and is choſen by the ſeventy-two benedictines, who compoſe this chapter. He formerly poſſeſſed the ſovereignty of the town; but the inhabitants ſhook off his authority, and became independent. However, the diſputes of the rival parties have been compromiſed by the interpoſition of the Swiſs cantons. The town is entirely proteſtant,

and

and its government ariſto-democratical; the ſubjects of the abbot, whoſe territory is very extenſive, are moſtly catholics. It is remarkable, that the abbey in which the prince reſides is ſituated cloſe to the town, and in the midſt of its territory; as the town is alſo entirely ſurrounded by the poſſeſſions of the prince. The town owes its flouriſhing ſtate to the uncommon induſtry of its inhabitants, and to the very extenſive commerce, ariſing chiefly from manufactures of linen, muſlin, and embroidery. In this town the arts and ſciences are much cultivated, and literature is held in high eſtimation. The library belonging to the abbey is very numerous and well arranged; and among a number of monkiſh MSS. of which thirteen volumes in folio contain letters of the firſt Swiſs and German reformers, contain ſeveral claſſic writers. To this library we owe Petronius Arbiter, Silius Italicus, Valerius Flaccus, and Quintilian, copies of which were found in 1413. Many of its curious MSS. were borrowed, during the council of Conſtance, and never returned.

The ſubjects of the abbot of St. Gallen formerly amounted to no leſs than 90,000. His dominions compriſed, firſt, the ancient territory of the abbey (Alte Landſchafften), and ſecondly, the country of Tockenburgh, which was purchaſed, in 1468, by Ulric abbot of St. Gallen, from the laſt count who died without iſſue male. The former, or Alte Landſchafften, comprehended 124 ſquare geographical miles, occupied by 45,000 inhabitants, and the latter included 188 ſquare miles, and the number of its inhabitants was 46,000. After various diſputes between the abbot, ſupported by the catholic, and the people aided by the proteſtant, cantons, the conſtitution of the Tockenburgh was ſettled in 1718, which preciſely aſcertained the prerogatives of the abbot and the privileges of the people. New diſputes occaſionally aroſe, and in the effervеſcence of the revolution, the abbot was driven from the country, and obliged to take refuge in the Brifgau. In the new diviſion of Switzerland, in 1798, the dominions of the abbot, and the town of St. Gallen, were compriſed in the canton of Sentis, of which St. Gallen was the capital.

According to the conſtitution of the 29th of May, 1801, St. Gallen was annexed to Appenzel, and formed the ninth department.

GALLEN-*Head*, a cape on the W. coaſt of the iſland of Lewis. N. lat. 58° 11'. W. long. 7° 4'.

GALLENBOULON, a town on the eaſtern coaſt of the iſland of Madagaſcar, ſituated on a creek of the ſame name. S. lat. 17° 20'. E. long. 54° 4'.

GALLENEK, a town of the duchy of Carniola; 14 miles S.E. of Stein.

GALLENSTEIN, a town of the duchy of Stiria; 3 miles W. of Reiffling.

GALLEON. See GALLION.

GALLERICA LAPIS, a name given by the writers of the middle ages to a ſpecies of emerald, which was larger than the finer gems of that kind, and of a pleaſant green, but debaſed by an admixture of white.

GALLERY, in *Architecture*, is an apartment of a houſe not always deſtined to anſwer the ſame purpoſe. Savot, in his architecture, derives the word gallery from *Gaul*, as ſuppoſing the ancient Gauls to have been the firſt who uſed them. Nicod fetches it from the French *aller*, *to go*; q. d. *allerie*: others bring it from *galere*, *galley*; becauſe it bears ſome reſemblance thereto in reſpect to health.

A common paſſage to ſeveral rooms in one range in any of the upper ſtories of a houſe is called a gallery. It is alſo uſed for an exhibition room of pictures. The length of galleries are (according to Palladio) from five to eight times their breadth. In churches and theatres the galleries are thoſe platforms raiſed upon pillars for the accommodation of a greater number of people than could be done upon the ground floor.

GALLERY, in *Fortification*, a covered walk, or paſſage, made acroſs the ditch of a town beſieged, with timbers faſtened on the ground, and planked over.

The ſides of the gallery are to be muſket-proof, and to conſiſt of a double row of planks, lined with plates of iron; and the top is ſometimes covered with earth, or turf, to hinder the effect of ſtones, artificial fires, &c. of the enemy.

Galleries are chiefly uſed to ſecure and facilitate the miners' approach to the face of the baſtion, over the moat, which is already ſuppoſed filled up with faggots and bavins, and the artillery of the oppoſite flank diſmounted. Sometimes this is called a *traverſe*.

GALLERY, in *Gardening*, a kind of covered walk, in a garden or pleaſure-ground, formed by trees of the hornbeam, lime, and others of the ſame kind, in the following manner. A line is firſt to be drawn to the length of the intended gallery, and this is to be planted with hornbeam, which is to be the foundation of the gallery. Theſe require no further care than to be ſheared a little, and ſometimes digged about, as there may be occaſion. But the chief curioſity is in the ordering the fore-part of the gallery, and forming the arches. The pillars of the porticoes, or arches, muſt be placed at four feet diſtance from one another, and the gallery muſt be 12 feet high, and 10 feet wide, that there may be room for three perſons to walk abreaſt in it. When the hornbeams are grown to the height of three feet, the diſtance of the pillars well regulated, and the ground-work of the gallery finiſhed, the next thing is to form the frontiſpiece; to perform which, the hornbeam muſt be ſtopt between two pillars at the height, and a trellis, made for that purpoſe, muſt be run up, which forms the arch. As it grows up, thoſe branches which out-top the others, muſt be levelled with the ſhears; and in time they will grow very ſtrong, and may be kept in regularity by the ſhears. Portico galleries may be covered with lime-trees.

Galleries in general have been always but ſlightly eſteemed in England; they were once very much in repute in the gardens of Italy, and other hot countries, but now they are got out of credit even there. Miller.

GALLERY *of a Mine*, denotes the branch, or that narrow paſſage under ground, leading to a mine carrying on under any work deſigned to be blown up.

The beſiegers and beſieged do each of them carry galleries, or branches under ground, in ſearch of each other's mines; and theſe ſometimes meet and deſtroy each other.

GALLERY, in *Mining*, ſignifies a drift or paſſage under ground, in or leading to ſome mine: gang-way, gate, augle, audit, level, ſough, brough, &c. are terms of nearly ſimilar import, in different mining diſtricts.

GALLERY *in a Ship*, is a kind of balcony, made upon the ſtern, without-board, into which there is a paſſage out of the great cabin.

Theſe galleries are for ſhew, and the captain's pleaſure, rather than any other benefit; for, in ſhips of war, all open galleries of this kind are to be avoided; on account of the facility of an enemy's entrance and boarding of the ſhip that way.

GALLERY-*ladder*, in a *Ship*. See LADDER.

GALLERY, *Whiſpering*. See WHISPERING *places*.

GALLESE, in *Geography*, a town of Italy, in the Patrimonio; 25 miles from Rome.

GALLEY, in *Chemiſtry*, is the name given to reverberatory furnaces, in which ſeveral retorts may be placed at the

ſides

ſides of each other. They are ſo called becauſe they are oblong, and have lateral openings, in which they are ſuppoſed to reſemble galleys.

GALLEY, in *Naval Language*, a low-built veſſel, going both with oars and ſails; chiefly uſed by the ſtates bordering on the Mediterranean.

The galley is called by the Greek authors under the eaſtern empire γαλαια, and γαλεια; and by the Latin authors of the ſame time, *galea*; whence the modern denomination. Some ſay it was called *galea*, on account of the figure of a caſk or helmet, which it bore on its head or prow, as Ovid atteſts, De Triſtib. The French call it *galere*; becauſe they ſay that the top of the maſt is uſually cut in manner of a hat, which the Italians call *galero*. Others derive both *galea* and *galere* from a fiſh, by the Greeks called γαλεωτης, or ξιφιας, and by us the *ſword-fiſh*, whoſe ſhape this veſſel reſembles. Laſtly, others derive *galley*, *galea*, *galere*, *galeaſſe*, &c. from the Syriac and Chaldee *gaul* and *gallin*, a man expoſed on the water, or in a veſſel of wood.

The largeſt ſort of theſe veſſels, called *galeaſſe*, is employed only by the Venetians. They are commonly 162 feet long above, and 133 feet by the keel; 32 feet wide, with 23 feet length of ſtern-poſt. They are furniſhed with three maſts, and 32 banks of oars; every bank containing two oars, and every oar being managed by ſix or ſeven ſlaves, who are uſually chained to it. In the fore-part they have three little batteries of cannon, of which the loweſt is of two 36-pounders, the ſecond of two 24-pounders, and the uppermoſt of two two-pounders; three 18-pounders are alſo placed on each quarter. The complement of men for one of theſe galleys is generally 1000, or 1200. They are very convenient for bombarding, or making a deſcent on an enemy's coaſt, becauſe they draw little water; and, on account of their oars, they have often the advantage of ſhips of war in light winds or calms, by cannonading the latter near the ſurface of the water, by ſcouring their whole length with their ſhot, and at the ſame time keeping on their quarter or bow, ſo as to be out of the direction of their cannon. The galleys next in ſize to theſe, called alſo *half-galleys*, are from 120 to 130 feet long, 18 feet broad, and nine or 10 feet deep. They have two maſts, which may be ſtruck at pleaſure, and are furniſhed with two large lateen ſails, and five pieces of cannon; they have commonly 25 banks of oars, as already deſcribed. Thoſe of a ſize ſtill leſs than this are called *quarter-galleys*, carrying from 12 to 16 banks of oars.

All the galleys, both ancient and modern, are of a finer and ſlenderer make than ſhips. Formerly they made divers kinds; at preſent the galleys are all alike: all the difference between them is as to ſize, and nothing as to figure. They uſually keep towards the coaſts; though ſometimes they croſs the ſea.

The king of France formerly kept up 40 galleys for the uſe of the Mediterranean, the arſenal thereof being at Marſeilles. The general of the galleys bears a double anchor, placed in pale, behind the eſcutcheon of his arms, as a mark of his office.

Galleys in Latin are called *biremes*, *triremes*, and *quadriremes*; not on account of their having two, three, or four ranges of oars before one another, as many learned men have imagined, and particularly Scaliger and Snellius, though this laſt has wrote excellently on the ſubject of navigation; for this were impracticable; nor yet on account of their having but two, or three, or four oars, for then they would want ſtrength; but becauſe there were two, three, or four rowers, faſtened to each oar, as in the galleys uſed among us; as is very well ſhewn by the Jeſuit Dechales in his "Art of Sailing." The error was occaſioned by ſome ancient galleys, repreſented on medals, or baſſo relievos, wherein are ſeveral ranges of rowers placed over each other; but all the mathematicians, pilots, and ſhip-builders, look on this as a mere viſion; inaſmuch as Pliny makes mention of galleys of 15, 20, 30, 40, 50 rows of rowers: ſo that, if they were ranged over each other, though we were only to allow four feet for each deck, there would be a diſtance of 160 feet between the loweſt rowers and the higheſt; and yet we are aſſured that the higheſt veſſel ever built was only 72 feet high.

Scaliger affirms, that the firſt *triremis*, or galley of three ſtories, was built at Corinth; and is of opinion that what Pliny calls *long ſhips*, were what we call *galeaſſes*: the firſt of which was that of the Argonauts. Vegetius mentions a galley of five decks; and Memnon another with eight, and only one man to each oar. See ENNERIS.

GALLEY, *Captain*, is the principal galley of a ſtate, commanded by the captain-general of the galleys: in France the royal galley is the firſt.

GALLEY, *Patroon*, denotes the ſecond galley both of France, Tuſcany, and Malta.

The ſecond general of the galleys is always on board the royal galley; and the lieutenant on board the patroon.

The terms peculiar to galleys are very numerous, and make a new ſyſtem of ſea-language different from that uſed in ſhips.

Monſ. de Baras, an ancient officer on board the king of France's galleys, engaged himſelf in writing a new dictionary of the dialect of the galleys.

GALLEYS, *Condemnation to the*, is a penalty impoſed on criminals and delinquents, whereby they are adjudged to ſerve the king, or ſtate, as ſlaves on board the galleys, either for ever or for a limited time.

Condemnation to the galleys for ever imports confiſcation of lands, goods, &c.; for, in France, that which confiſcated the perſon confiſcated the goods.

A man condemned to the galleys for perpetuity is dead in a civil ſenſe. He cannot diſpoſe of any of his effects; cannot inherit; and, if he be married, his marriage is null; nor can his widow have any of her dower out of his goods.

The eccleſiaſtical courts cannot ſentence to the galleys: it is out of their juriſdiction.

By an ordonnance of Charles IX. in 1564, the judges are enjoined not to condemn a criminal to the galleys for leſs than ten years: and Henry III. by another of 1579, enjoins the captains not to detain their galley-ſlaves after their time is expired. But neither of theſe laws are now obſerved.

GALLEY, in *Printing*, a wooden frame or inſtrument formed of an oblong ſquare board, with a ledge on three ſides, and a groove to admit a falſe bottom called a galley-ſlice, into which the compoſitor empties the letters out of his compoſing-ſtick, as often as it is filled.

The galley, when filled, contains the matter of one page; and when they have compoſed as many pages as are required for a whole ſheet, half ſheet, or the like, they impoſe them, *i. e.* they take the ſeveral pages out of the galleys; put them into a chaſe; lock them up with the furniture; and ſo make forms ready for the preſs.

GALLEY-*halfpence*, a kind of coin, which, with *ſuſkins* and *doitkins*, were forbidden by the ſtatute Hen. V. cap. 1. It is ſaid they were brought into this kingdom by the Genoeſe merchants, who, trading hither in galleys, lived commonly in a lane near Tower-ſtreet, and were called Galley-men; land-

ing

ing their goods at Galley-key, and trading with their own ſmall ſilver coin, termed galley-halfpence.

GALLI, or GALLÆ, in *Antiquity*, a name given in Phrygia to the eunuch-prieſts of the goddeſs Cybele.

The principal of them was called *Archi-Gallus*. The Galli were alſo called *Dactyli Idæi*, *Corybantes*, &c. Authors are not agreed as to the reaſon of this denomination. Some derive the name from the river Gallus; becauſe theſe prieſts drank of its waters, which inſpired them with a kind of religious fury and enthuſiaſm, and deprived them of their ſenſes to ſuch a degree, that they mutilated themſelves; this was preſcribed by Cybele as a qualification for their office: thus Ovid, "Qui bibit, inde furit."

Others hold, that the firſt prieſt of Cybele having been named Gallus, the name became appropriate to all his ſucceſſors. Voſſius, who propoſes theſe two opinions, ſeems to incline moſt to the latter; though Ovid, in the fourth of his Faſti, and Herodian, lib. i. favour the former.

When youth were initiated into this order, the cuſtom in Syria, according to Lucian, was to throw off their cloaths, to make loud cries, and with drawn ſwords to caſtrate themſelves; after which they ran about the ſtreets, carrying in their hands the marks of their mutilation, which were thrown into a houſe, and in that houſe they put on women's dreſs.

Theſe prieſts threw themſelves into a kind of phrenſy when they performed the ceremonies of the goddeſs; apparently in imitation of the young Atys, her favourite, whom they likewiſe imitated, by mutilating themſelves. For authors relate, that Cybele being deſperately in love with that young Phrygian, ſhe gave him the ſuperintendance of her ſacrifices, on condition he would keep his virginity; but that ſoon after, forgetting his promiſe, he had an affair with the nymph Sangaritis; that Cybele, provoked hereat, ſtruck him mad; that in a vehement exceſs of his phrenſy he was going to kill himſelf; and that the goddeſs, relenting, reſtored him to his underſtanding; that, out of his own remorſe, he caſtrated himſelf; and that after his example all the prieſts of Cybele from that time did the like.

Their phrenſy, at the time of the ſacrifices, conſiſted in throwing round the head with great rapidity, and making violent contortions of the whole body: they had alſo drums and flutes, wherewith they played and danced to them: as already obſerved under the articles CORYBANTES and CURETES.

Van-Dale conſiders theſe Galli as ſo many ſtrollers, vagrants, and quacks, who went about ſtrolling from town to town, playing upon cymbals and crotala, wearing on their breaſts ſmall images of the mother of the gods, in order to raiſe charitable contributions. Apuleius repreſents them as the dregs of the people, as a ſet of furious fanatics, and as infamouſly debauched. They are held in equal contempt by Clemens of Alexandria, Lactantius, Chryſoſtom, and St. Auguſtine. Nevertheleſs, we learn from Cicero, that the law provided for their ſubſiſtence, and marked out days when they had permiſſion to aſk alms, and on which none elſe were allowed to go a-begging; this kind of begging, authorized by law, occurred about once in every month, and hence the prieſts obtained the name of "Menagyrtæ" and "Metragyrtæ;" becauſe it was for the mother of the gods they collected theſe alms: they were alſo denominated, by way of deriſion, "Agyrtæ," an appellation which denotes jugglers and dealers in legerdemain for money. Accordingly Clemens of Alexandria adds to the qualifications of theſe Galli that of a fortune-teller and ſooth-ſayer, becauſe they really pretended to prediction. They had always in their retinue old women, who paſſed for ſorcereſſes. Plutarch ſays of them, ſpeaking of the verſes which they ſang, that they had brought the poetry of oracles into ſuch contempt, that by their means the true oracles of the Tripos, *i. e.* of Delphi, were wholly neglected. The ſame author adds, that they delivered their oracles extempore, or drew them by lot from certain books which they carried with them, and ſold their wretched predictions to ſilly women who were charmed with the cadence of their verſes.

GALLI, *Caput*. See CAPUT.

GALLI, *Criſta*. See CRISTA.

GALLI, *Signora*, in *Biography*, arrived in England at the ſame time as Fraſi, in 1743, when lord Middleſex was proprietor of the Opera-houſe, and the principal ſingers were Monticelli, the Viſconti, and Amorevoli. Galli's voice being of a lower pitch, which the Italians call *mezzo ſoprano*, and her appearance being leſs feminine than that of Fraſi, in "Enrico," ſet by Galuppi, ſhe firſt performed a man's part, and was afterwards frequently employed in male parts on the ſtage. There was ſomething ſpirited and intereſting in her manner; however, ſhe was little noticed by the public till ſhe ſung in Handel's oratio of "Judas Maccabæus," 1746, when ſhe acquired ſuch favour in the air "'Tis liberty alone," that ſhe was not only encored in it every night, but became an important perſonage, among ſingers, for a conſiderable time afterwards.

GALLIA, in *Geography*, a county of America, in the ſtate of Ohio; bounded N. on Waſhington and Roſs; S. and E. on the Ohio; and W. on Roſs and Scioto counties.

GALLIA, in *Ancient Geography*. See GAUL.

GALLIAMBIC, in the *Ancient Poetry*. Galliambic poems denote compoſitions in Galliambic verſes.

GALLIAMBIC *Verſe*, a ſort of iambic, conſiſting of ſix feet; 1. An anapæſt, or a ſpondee; 2. An iambic, or an anapæſt, or tribrach; 3. An iambus; 4. A dactyl; 5. A dactyl; and 6. Anapæſt.

Though one might meaſure the Galliambic verſe in another manner, and make a different arrangement and combination of ſyllables, which would give different feet. It is certain the ancients regarded little more in the Galliambic verſe beſide the number of meaſures, or intervals, without troubling themſelves about the number of ſyllables, or the kinds of feet whereof it was compoſed.

GALLIAMBUS, in *Poetry*, a pleaſant kind of verſe, uſed to be ſung by the Galli, prieſts of Cybele, in honour of that goddeſs.

The word is a compound of *Gallus*, a prieſt of Cybele, and *iambus*, a foot in the Greek and Latin verſe.

Galliambus alſo denotes a piece or compoſition in Galliambic verſes.

GALLIANO, in *Geography*, a town of Italy, in the department of the Lario; ſix miles S.S.E. of Como.

GALLIARD, JOHN ERNEST, in *Biography*, a native of Zell, in Suabia, and, according to Walther, the ſon of a French peruque-maker, and ſcholar of Marichal; though it has been ſaid by one of his biographers, that he had leſſons of the Abate Steffani, and Farinelli, director of the concerts at Hanover, and author of the ground that goes under his name, upon which Corelli's 12th ſolo is founded.

He came into England in the ſuite of prince George of Denmark; his inſtrument was the hautbois, which he played in public, perhaps for the laſt time, in accompanying Mrs. Barbier in a ſong at his benefit in Lincoln's-inn Fields playhouſe, 1722. He ſeems to have ſtudied our language on his arrival in this country with conſiderable diligence and ſucceſs; for in 1712 he was choſen by Hughes to ſet his opera

of "Calypſo and Telemachus," for the Queen's theatre in the Haymarket. And he afterwards not only compoſed cantatas written by Hughes and Congreve, but the muſic of many entertainments and pantomimes for Lincoln's-inn Fields and Covent-garden; and, in 1742, publiſhed an admirable tranſlation of Toſi's Art of Singing. But in 1709, it is not probable that he could have been the tranſlator of Raguenet's "Parallele des Fran. et des Ital." as has been imagined, the Engliſh of which is even ſuperior to that of the tranſlation of Toſi. He was conſtantly attached to Rich, both at Lincoln's-inn Fields and Covent-garden, and compoſed for no other theatres; though his hunting ſong in the Royal Chace, "With early horn," was long the delight of every play-houſe and public place in the kingdom. Beard and Lowe hardly ever appeared on the ſtage without being called upon to ſing it, and, indeed we ſcarcely know a more agreable vocal *chaſſe*, than it ſtill continues to be.

In 1728, he publiſhed, by ſubſcription, his muſic to the hymn of Adam and Eve, from Milton; this is extremely well ſet in the grave and learned ſtyle of Steffani. The recitative is ſtill in the more ancient ſtyle of Italy, in which there are formal cloſes, terminated with a ſhake, inſtead of the more colloquial cadence of modern recitation.

He compoſed, in queen Anne's time, for victories obtained by the duke of Marlborough, a Te Deum, and Jubilate, and three anthems, for St. Paul's.

In 1746, being in years, and not in ſplendid circumſtances, Rich, the patentee, propoſed to let him have a benefit concert at Lincoln's-inn Fields; when this venerable muſician was ſo truly ſimple and ignorant of the world, that he *whiſpered* it to Quin, as a profound ſecret, deſiring him not to ſpeak of it.—"Why then," ſays Quin, "by keeping it a ſecret, you intend only good maſter Galliard, that this ſhall be a benefit for your friends, to ſave them the expence of tickets; and to wait for your own benefit, till you ſhall be allowed *benefit of clergy*—at your funeral."

At this his laſt benefit, among his other compoſitions that were performed on the occaſion, there was a piece for twenty-four baſſoons and four double baſes! This worthy muſician, who died in 1749, was certainly an excellent contrapuntiſt; but with reſpect to his compoſitions in general, we muſt confeſs, that we never ſaw more correctneſs, or leſs fancy and originality in any author that we have examined of the laſt century, Dr Pepuſch always excepted.

GALLIARD, or *Gagliarda*, in *Muſic* and *Dancing*, a ſort of dance, anciently in great requeſt; conſiſting of very different motions and actions, ſometimes proceeding *terra à terra*, or ſmoothly along; ſometimes capering; ſometimes along the room, and ſometimes acroſs.

The word is French, *galliarde*, or rather Italian: and literally ſignifies *gay*, *merry*, *ſprightly*. This dance was alſo called *Ramon ſque*, becauſe brought from Rome.

Thoinot Arbeau, in his Orcheſography, deſcribes it as conſiſting of five ſteps, and five poſitions of the feet, which the dancers performed before each other, and whereof he gives us the ſcore, or tablature, which is of ſix minims, and two triple times.

GALLIARD, in *Mining*, ſignifies, in ſome diſtricts, the ſame ſubſtance as ganiſter or crowſtone, a fine-grained ſilicious ſtone, uſually imbedded in fire-clay, and abounding with large and curious impreſſions of vegetables. See CROW-STONE.

GALLIARD'S *Iſland*, in *Geography*, a ſmall iſland of America, in South Carolina, in the Santee. N. lat. 33° 30'. W. long. 80° 10'.

GALLIARDA, in the *Italian Muſic*, the name of a tune that belongs to a dance called a galliard. The air of it is lively in triple time.

GALLIC ACID. *Acide Gallique*, Fr. *Galluſſaure*, *Gallapfelſaure*, Germ.—The infuſion of nut-galls had long attracted the attention of chemiſts, and had been the ſubject of numerous experiments before it was proved to contain a peculiar acid. Dr. Lewis, when engaged in an enquiry on the beſt method of making ink, found that the precipitate which a ſolution of galls affords with ſulphat of iron is not attracted by the magnet; he likewiſe obſerved that the black colour which it imparts to the acid ſolutions of iron is capable of being deſtroyed and re-produced by the alternate application of alkalies and acids. The academicians of Dijon went farther; they aſcertained that it reddened vegetable blues, diſſolved iron, decompoſed the alkaline hydro-ſulphurets, produced with metallic ſolutions various coloured precipitates, and, that when diſtilled, the fluid product had the ſame properties as the original ſolution; but it was reſerved for Scheele to ſeparate the acid from the ſubſtances with which they had examined it, in combination. This he in a great meaſure effected by the proceſs which he made public in 1780. The acid diſcovered by the Swediſh chemiſts, when its peculiar nature was determined, acquired, on account of the ſubſtance which firſt afforded it, the name of acid of galls, or gallic acid. But it is not confined alone to nut-galls; a variety of other aſtringent vegetables are capable of affording it.

The following method of obtaining the acid, is that diſcovered by Scheele. Make an infuſion, by macerating one part of gall-nuts, reduced to a coarſe powder, in ſix parts of cold water. At the end of fifteen days filter the ſolution, and place it in a large veſſel, covered with a ſheet of paper, in a warm room. In a ſhort time, a mouldy pellicle will appear on the ſurface of the liquid, which is to be occaſionally broken: as the operation proceeds, the original aſtringent taſte diminiſhes, and the acid taſte becomes more ſenſible. At the end of two or three months, the interior of the veſſel will be found coated with a brown matter, containing diſperſed, ſhining, granular, cryſtals. Separate this ſediment, and cover it with rectified alcohol; gently heat the mixture, and a ſolution of the cryſtallized acid in alcohol will be formed, which, evaporated, affords gallic acid in the form of very fine grains.

Scheele diſcovered that gallic acid is volatilized by a low degree of heat; and, in diſtilling nut-galls, he found the acid ſublimed and condenſed in the receiver. Mr. Deyeux was the firſt to avail himſelf of this property, in order to obtain the acid free from the tannin and extractive matter, which it always contains, when prepared in the old way. He gradually heated powdered nut-galls in a large glaſs retort, till a ſublimate aroſe, which condenſed in brilliant white cryſtalline plates. An increaſe of heat occaſions the decompoſition of the acid; and if the operation is long continued an oil diſtils over that diſſolves the acid ſublimate, and renders the experiment fruitleſs. This method, without great precaution, is very liable to fail. Mr. Davy recommends ſeparating previouſly ſome of the tannin of the nut-galls, by infuſing them, for a ſhort time, in a little water, by which means the production of empyreumatic oil is diminiſhed. The ſame chemiſt obſerves, that it is time to ſtop the operation, when the cryſtals formed in the lower part of the retort begin to melt. But, even allowing all theſe precautions are obſerved, it appears almoſt impoſſible to obtain the acid entirely free from empyreumatic oil, the preſence of which is indicated from the very commencement of the operation, by the peculiar aromatic ſmell that is produced.

A variety of other methods have been propoſed for procuring

curing the acid in a ſtate of purity. It will be ſufficient to mention briefly thoſe which appear moſt adequate to the purpoſe. Mr. Davy's method: Boil carbonat of barytes in an infuſion of galls; gradually add dilute ſulphuric acid to the bluiſh-green liquid which is thus produced, till all the barytes is ſeparated: the liquid, on the application of the common teſts, appears to be perfectly free from tannin and extractive matter; evaporate it to dryneſs, and the gallic acid will be obtained. This method is far preferable to the one recommended by Mr. Fiedler, which conſiſts in digeſting alumine with a ſolution of galls, decanting the clear liquor, and ſeparating the cryſtals of gallic acid, (more probably of ſuper-gallat of alumine.) which are produced by ſlow evaporation. Mr. Richter's method: Take any quantity of gall-nuts reduced to a fine powder; digeſt them in cold water; agitate the mixture; paſs the liquid through a cloth; add more water to the reſidual pulp; and ſeparate the water by means of a preſs: join the liquors, and ſlowly evaporate them; a brittle dark coloured ſubſtance remains. Cover this ſubſtance, reduced to a fine powder, with alcohol, and a ſolution of a pale ſtraw-colour is formed; a ſecond infuſion of alcohol acquires but very little colour. Diſtil the two extracts together in a ſmall glaſs retort to one-eighth; add water to the reſidue, and expoſe it to a gentle heat; evaporate the ſolution thus formed, and very ſmall white priſmatic cryſtals of gallic acid will appear. By this proceſs, half an ounce of cryſtals may be procured from a pound of gall-nuts. M. Bouillon La Grange, who has employed it, ſays, he was never able to obtain acid of the purity deſcribed by Mr. Richter. The cryſtals he procured were always of a light ſtraw-colour; and he found that repeated diſtillations with alcohol did not render them white, the gallic acid itſelf being partially decompoſed by this treatment. One objection to this method is, that unleſs the alcohol is highly rectified it diſſolves a portion of tannin.

The properties of gallic acid appear, in ſome meaſure, to depend on the method employed for its production. The different methods, generally conſidered, are of two kinds, the dry and the moiſt. Accordingly, there appear two varieties of gallic acid, that procured by diſtillation differing conſiderably from that formed by cryſtallization, if any credit is to be attached to the obſervations of M. Bouillon La Grange.

Gallic acid, procured in the moiſt way, is of a light ſtraw-colour; it has a ſharp acid taſte, but poſſeſſes leſs aſtringency than nut-galls; it changes vegetable blues to red. For its ſolution, it requires 12 parts of cold water, or 1½ of boiling; and it imparts to this liquid a light lemon-colour, which becomes black by expoſure to the air. Alcohol takes up, when cold, about ¼th of its weight of this acid; but at a boiling temperature, nearly its own weight. It is ſoluble in either. Expoſed to heat, it readily fuſes; it forms juſt before it begins to ſublime a brown viſcid fluid; full of air-bubbles; and emits vapours which have an odorous ſmell. The action of a ſtrong heat partially decompoſes it; but to accompliſh this completely, it requires, on account of its volatility, to be ſubjected to repeated diſtillations, and the products appear to vary according to the intenſity of the heat applied. Scheele procured, by diſtilling it in a glaſs retort, firſt, an acid liquor, free from oil; next, part of the acid itſelf, which, condenſed in the liquid, forms and ſhoots into cryſtals, as it gradually cools, and a large reſidue of charcoal. M. Deyeux has found that it is capable of being converted by heat into oxygen and charcoal. From whence he concluded that it differs only from carbonic acid in containing leſs oxygen; but his reaſoning is fallacious, from his not having taken into conſideration the acid fluid that is alſo produced. On the contrary, M. Bouillon La Grange obtained, by its diſtillation, an acidulous liquid, charcoal, and much carbonic acid gas, with which was mixed a little carburetted hydrogen gas. The latter gas was ſo concealed by the former, that it did not appear inflammable till the carbonic acid gas was ſeparated by means of lime-water.

Gallic acid is decompoſed and carbonized by ſtrong ſulphuric acid; the ſame effect, moſt probably, is produced by liquid fluoric acid; nitric acid converts it partly into the malic and oxalic acids; oxymuriatic acid, according to M. Bouillon La Grange, has no action on it; it is ſoluble in the other acids without decompoſition.

With the earths and alkalies it combines, forming ſalts, denominated gallats, of which very little is known. The alkaline gallats poſſeſs a conſiderable degree of ſolubility: according to Richter they give black precipitates, with the ſalts of iron, and precipitate all other metallic ſolutions. From the obſervations of Mr. Davy, the alkaline earths appear capable of combining with two different proportions of this acid, an exceſs of acid rendering the ſalts very ſoluble, which before poſſeſſed little ſolubility. Gallic acid precipitates glycine, yttria, and zircon from their acid ſolutions, and decompoſes all the carbonats.

The gallats are decompoſed by a ſtrong heat. Some of them have been found to yield acetic acid when diſtilled with very dilute ſulphuric acid.

The action of gallic acid on metallic ſalts appears to be proportionable to the ſtrength of the affinity which the different metals have for oxygen. The ſolution of this acid imparts to a ſolution of gold a dark green colour, and produces a brown precipitate, which is metallic gold. It renders a ſolution of ſilver brown, and occaſions, with the aſſiſtance of a gentle heat, the depoſition of a grey powder, which is finely divided ſilver. The precipitate which it gives with a ſolution of mercury is orange yellow; with a ſolution of copper, brown; with a ſolution of acetat of lead, white; and with biſmuth, lemon coloured. It imparts to molybdic acid a dark yellow, without occaſioning any precipitate. It appears to have no effect on the ſalts of platina, zinc, tin, cobalt, and manganeſe. When boiled on red oxyd of mercury, the acid itſelf is decompoſed, and running mercury is produced. It ſuffers the ſame change when ſimilarly treated with the black oxyd of manganeſe or oxyd of tin; but theſe metals, inſtead of being reduced, are brought only into lower ſtates of oxydation. The moſt diſtinguiſhing property this acid poſſeſſes, is that of giving dark-blue coloured precipitates with the oxygenated ſalts of iron. According to M. Berthollet's views of the ſubject, it is not abſolutely neceſſary that the iron ſhould be at the maximum of oxydation for this effect to be produced, for he obſerves that the ſalts which contain the oxyd at the minimum, though not changed at firſt by gallic acid, yet become coloured; when the ſolution confined from air is much diluted with water. He conceives, and M. Richter is of the ſame opinion, that every thing which weakens the affinity of the ſulphuric acid for the oxyd promotes the combination of the gallic acid with the metal in whatever ſtate of oxydation it may be: indeed the latter chemiſt aſſerts, that a ſolution of green ſulphat of iron is never coloured by gallic acid, unleſs tannin be preſent, which, according to him, attracts the ſulphuric acid, and then the gallic acid unites with the oxyd of iron ſeparated. Mr. Prouſt, from his obſervations, has been led to a different concluſion. He thinks that iron is incapable of combining with gallic acid, unleſs highly oxydated; and he thus explains the colour which a mixture of green ſulphat of iron and gallic acid acquires by expoſure to the air; the blackening of ink after being poured out of cloſe

veſſels, and many of the manipulations of dyers who find their profit in this oxydating proceſs carried on in the atmoſphere. M. Berthollet indeed admits that gallic acid ſtrikes a deeper colour with the oxygenated ſalts of iron, than with thoſe which contain leſs oxygen; but he attributes this effect to the decompoſition of the acid itſelf, and the developement of ſome of its charcoal.

Such are the general properties of gallic acid procured in the moiſt way. M. Bouillon La Grange has pointed out a few inſtances in which the acid obtained by ſublimation according to the method of Deyeux differs. Theſe differences it will be neceſſary to mention, they are principally the following. The ſublimed acid is leſs acid to the taſte. It gives to metallic ſolutions precipitates of different colours. Its ſolution is darkened by oxymuriatic acid. It imparts variable colours to ſulphat of iron, and it does not precipitate gelatine. It moreover appears to contain a little eſſential oil, which by diſſolving the acid in water, ether, or a ſtrong ſolution of pot-aſh, ſeparates, becomes ſenſible to the ſmell, and is ſeen ſwimming on the ſurface of the fluid.

The nature of gallic acid is not yet ſatisfactorily determined. The generally received opinion is, that it is a ſimple acid, but there are ſome chemiſts who maintain it to be a compound one; M. Bouillon La Grange has endeavoured to ſhew that the cryſtallized acid procured in the moiſt way is compoſed of acetic acid, tannin, and extractive, and that the acid obtained by ſublimation is merely acetic acid modified by a peculiar eſſential oil. His arguments for this opinion are, the difficulty, indeed the impoſſibility, of obtaining the acid free from theſe impurities, and the production of acetic acid by the diſtillation of gall-nuts with water, and alſo by ſubmitting ſome of the gallats to the ſame operation with dilute ſulphuric acid. However ingenious this reaſoning may be, it is not concluſive. Doubt can be alone baniſhed from the ſubject, by ſubmitting the theory to the teſt of experiment; by endeavouring to form gallic acid of either kind by adding to the acetic the ſubſtances by which it is ſuppoſed to be modified, in the acid in queſtion. It is certain, however, that, like the other vegetable acids, gallic acid is a compound of carbon, hydrogen, and oxygen, and not, as M. Deyeux maintains, of carbon and oxygen alone.

Its uſes are few, in its pureſt ſtate, and theſe are known alone in the laboratory of the chemiſt; but in combination with other ſubſtances, it is of extenſive and important applications in the arts. See the articles DYEING and INK.

GALLICAN CHURCH denotes the church of France; or the aſſembly or convocation of the prelates of France.

M. du Pin has an expreſs treatiſe of the liberties of the Gallican church. See CHURCH.

GALLICAN *Breviary* denotes the breviary uſed by the church of Agrigentum, in Sicily; which the modern writers call Breviarium Gallicanum.

The reaſon, no doubt, is its having been introduced by St. Gerlan, who was made biſhop of Agrigentum, after earl Roger had been driven out of Sicily by the Saracens; and by the other French biſhops, whom the Norman princes brought thither. See BREVIARY.

GALLICAN *Liturgy* is the manner of performing divine ſervice anciently obſerved in the Gauls.

F. Mabillon ſhews wherein it differed from the Roman liturgy. 1 Liturg. Gall. cap. 5, &c.

GALLICAN *Maſs*. See MASS

GALLICIA, or GALICIA, in *Geography*, a province of Spain, ſituated at the north-weſt angle of the country, and forming a very irregular kind of quadrilateral. On the north and weſt it is bounded by the Atlantic ocean; on the eaſt by Aſturia and Leon, and on the ſouth by the Portugueſe provinces of Tras-los-Montes and Entre-douro-è-Minho. Its mean extent is about 46 leagues from north to ſouth, and 140 leagues from eaſt to weſt. This country took its name from its ancient inhabitants, the Callaici, whence have been formed the names of Gallæci, Galiciæ, and Galicia. Gallicia was conſtituted a kingdom in the year 1060 by Ferdinand the Great, king of Leon and Caſtile, who gave this province to his ſon Don Garcias. But till the reign of Ferdinand V. and Iſabella, in 1474, the inhabitants, hemmed in by their mountains and rivers, paid little reſpect to the royal authority. The nobility exerciſed a kind of ſovereignty in their own territories, and countenanced their ſubjects in the pillage of ſtrangers. Theſe diſorders, however, were terminated by Ferdinand and Iſabella, who civilized the country, and entered into an engagement with the Gallicians, that their kingdom ſhould always preſerve its title. It is at preſent the moſt populous province in Spain. This country is, in general, very mountainous; interſected with beautiful valleys, and bounded by ſmall plains; the mountains are for the moſt part well wooded, and abound in game. The lands produce ſome wheat and oats, a great quantity of maize, millet, flax, hemp, pulſe, lemons, and other fruit, and in ſome places wine. Oak, walnut, cheſnut, and hazle trees are numerous. The inhabitants rear many horned cattle and mules. One of the principal branches of the induſtry of this province conſiſts in woollen manufactures, blankets, and hoſiery, and particularly in common linens. The lands generally belong to the nobles, to churches, and to monaſteries, ſo that the maſs of the people have ſcarcely any property. Gallicia is interſected by a chain of mountains, which proceeds from the Pyrenées near Roncevallos, between Biſcay and Navarre, directing its courſe to the north-weſt, and leaving on its right the Aſturias, penetrating by Leon into Gallicia, which it traverſes, and continues till it is ſtopped by the ſea, after forming cape Finiſterre. The mountains of this Gallician branch have different names; the moſt conſiderable of which is the Sierra de Mondonnedo, of great extent, occupying the whole extremity of the north-eaſt of Gallicia towards the Aſturian boundary on the eaſt, and proceeding to the north as far as cape Ortegal, and to the weſt as far as the Atlantic ocean. As this province has 100 leagues of coaſt its ports are numerous, ſome on the north and others on the weſtern ocean. In number they are more than 40, but in general they are very ſmall. Thoſe that chiefly deſerve notice are, Maria, Corcuvion, Bayona, Pontevedra, Muroz, Guardia, Vigo, Corunna, Ferrol, Santa Marta, Vivero, Ribadeo, &c. Its principal rivers are the Eo, or Rio de Miranda, which ſeparates the frontiers of Aſturias from Gallicia, and after purſuing a courſe of 24 leagues from ſouth-eaſt to the north, falls into the northern ocean above Ribadeo in Gallicia, and Caſtropol in Aſturia; the Ulla or Ilia, which has a courſe of 23 leagues from the north-eaſt to the ſouth-weſt; the Tambra, or Tamaris, which gives the name of Tamaricians to the people who occupy its banks, purſuing a courſe of 20 leagues from the north-eaſt to the ſouth-weſt; the Mandeo, whoſe courſe is 16 leagues from the eaſt to the north-eaſt; the Minho, which riſes in the eaſt of the Sierra Mondonnedo, and after receiving

ſeveral tributary ſtreams, and ſeparating Gallicia from Portugal, in a courſe of about 52 leagues, firſt from north to ſouth and then to the ſouth-weſt, falls into the ocean near the port of Guardia; the Sil, which riſes in the mountains to the weſt of Leon, and after a courſe of 33 leagues falls into the Minho. In this province they reckon 70 rivers, excluſively of ſmall ſtreams. The principal towns of Gallicia, are Compoſtella, Lugo, Tuy, Orenſe, Corunna, Finiſterre, Vigo, &c. &c. It has an archbiſhopric, San-Jago, four biſhoprics, Tuy, Orenſe, Mondonnedo, and Lugo; five cathedral and five collegiate chapters, ſeveral abbeys of Benedictines and Bernardines, two commanderies of religious orders, 3,683 pariſhes, 98 religious houſes, 30 hoſpitals, an univerſity, 5 colleges for the inſtruction of youth, 7 cities, 74 towns, 3,434 villages, upwards of 40 ports, 2,640 pariſh prieſts, 1,043 pariſh curates, 6,742 ſecular prieſts, 2,394 monks, 600 nuns, 13,800 nobles, 966 advocates and writers, about 4,500 ſtudents, 18,900 ſervants, and the total of the population is eſtimated at 1,345,810 perſons, or, as ſome ſay, 1,500,000, and according to others two millions. Its capital in Compoſtella or Saint Jago. The climate of Gallicia is generally conſidered as mild upon the coaſt, and cold in the interior, which is expoſed to winds and heavy rains, with ſome few exceptions.

This country is reckoned rich and productive. Each farmer keeps flocks of ſheep and goats in proportion to the extent of land which he poſſeſſes or cultivates; and the Gallicians are generally deemed laborious in the culture of their ſoil, and in other departments of agriculture. But they are not much addicted to the mechanical arts or to commerce. On this account many of them ſeek ſubſiſtence in the neighbouring province, where they are employed in the moſt ſervile and laborious employments, for which they are deſpiſed by the other Spaniards. There are, however, ſome manufactories in Gallicia: ſuch are thoſe of woollen ſtuffs, coarſe cloths and hoſiery at Lugo; thoſe of ropes and ſailcloth at Ferrol and Corunna; that of linen at Tuy; that of ſilk in the territory of Montforte, in the county of Lamos; thoſe of hats, &c. However, upon the whole, Gallicia is, with regard to manufactures, the leaſt induſtrious part of Spain. Its coaſts are ſo extenſive, and its rivers are ſo numerous, that it is plentifully ſupplied with various kinds of fiſh; ſuch as the bezugos, or hog-fiſh, which is taken in the months of November and December, and ſent quite freſh into Caſtile and Leon, ſalmon, herrings, ſhad, trout, lampreys, ſkate, eels, &c. The exports of this province are not very conſiderable; the cattle it produces, the fiſh, and the cloth it manufactures, are ſent into ſome of the provinces of Spain, and its ſalt proviſions are exported into foreign countries. They alſo ſend to other provinces table-linen, ſkins, hides, and leather, hats, tapes and knit ſtockings, wool and wine; and they alſo trade in cattle, mules and horſes. The importations from the Engliſh, French, and Dutch are received at the port of Vigo, and the exportations are ſent from the port of Corunna, from which Gallicia communicates with America, whither it ſends ſoap, ſkins, leather, and furriery, table-cloths, napkins and knit ſtockings; and in return it receives cocoa, logwood, ſugar, and other colonial productions.

Gallicia was formerly in great reputation for its mines; but thoſe that are now chiefly known are copper, lead, and tin. There are alſo white marble and jaſper between Corunna and Betanzos, and likewiſe marcaſite, vitriol, ſulphur, &c. The ſame mountains alſo furniſh excellent timber for building ſhips. Gallicia abounds in mineral waters of various deſcriptions. The woods, foreſts, and narrow paſſes of the mountains of Gallicia, were formerly infeſted with bears, wolves, foxes, wild aſſes, and birds of prey without number: but at preſent they ſupply roebucks, deer, hinds, ſtags, wild boars, and a great quantity of game. A fine breed of aſſes is preſerved, good hogs, and a large quantity of poultry.

The Callaici, who were the ancient inhabitants of this country, employed themſelves in war and hunting, and alſo in fiſhing. Their wives ploughed the land, ſowed, gathered the harveſt, and took care of their families. At preſent the traveller finds in the mountains of Gallicia ſimple and pure manners, a quiet and hoſpitable people, having no idea of luxury. The Gallicians are large, muſcular and robuſt, and capable of enduring fatigue. The women are fair, tolerably handſome, with black hair and eyes, fine teeth, and regular, but not very expreſſive features. The men,, women, and children go barefoot. In their diſpoſition they are grave, ſober, and prudent; they lead a kind of melancholy life, and keep little company. In other reſpects they are ſaid to diſtinguiſh themſelves by their probity and courage. They furniſh a great number of ſoldiers for the army; and they ſeem to be naturally inclined to arms. Thoſe of Montforte are remarked for this, as well as thoſe of Lamos, which is watered by the little river Cabe, and the capital town of which is ſituated upon a ſteep and lofty mountain. The Gallicians were the firſt poets of Spain. Before the deſcent of the Romans, they compoſed and ſung verſes, but they made little progreſs in this art. The preſent language of Gallicia is a mixture of the ancient Caſtilian of the time of Alphonſo the Wiſe, and of Portugueſe, with ſeveral expreſſions which it has retained of the ancient Roman language.

GALLICIA, *New*, a province of America, in the domain of Mexico, known alſo by the name of "Xaliſco." It is rather woody and mountainous: but the plains are very fertile, and produce moſt of the European fruits. Here are alſo mines of ſilver. Zaratecas, a very rich mining country, is regarded as a diſtrict of New Gallicia.

GALLICISM, a phraſe or conſtruction, peculiar to the French language; or which has ſomething contrary to the ordinary rules of grammar of other languages.

Thus, *Cet homme eſt ſur la bouche* is a Galliciſm, having no regular conſtruction; and the ſame may be ſaid of *Fair de la terre le foſſe;* which no grammar could ever find out.

With us it is uſed to denote ſuch phraſes or modes of ſpeech in Engliſh as are formed after the French idiom.

GALLICO, in *Geography*, a town of Naples, in Calabria Ultra; 5 miles N. of Reggio.

GALLICULUS, JOHN, in *Biography*, a German writer on counterpoint, in Latin, was contemporary with Martin Luther; and, according to Walther and Schamelius, compoſed the muſic to ſeveral Lutheran hymns and pſalm-tunes that were publiſhed at Leipſic. He was author of an ample treatiſe on counterpoint, in which the rules of compoſition, as far as the art was then known, are clearly explained; this book was printed in 1548 and 1553, and addreſſed to George Rhaw, the learned bookſeller and muſician of Wittemberg. This tract, which has for its title "Libellus de Compoſitione," contains twelve chapters, wholly appropriated to counterpoint.

There was another Galliculus (Michael) a Ciſtertian monk of Zell; who, in 1520, publiſhed a ſhort treatiſe "De vero pſallendi modo," to which Ornithoparchus refers his readers who are curious concerning the eccleſiaſtical chants. This book is in Anthony Wood's Coll. in the Aſhmol. Muſeum, Oxford.

GALLICUS MORBUS, the venereal diſeaſe. See LUES VENEREA.

GALLIGASKINS, in our *Old Writers*, denote wide hoſe

hoſe or breeches, having their name from their being uſed by the Gaſcoigns.

GALLIMATHIAS, a dark, perplexed diſcourſe, where words and things are huddled together, ſo as to make an inconceivable jargon.

The word is French, formed, as ſome will have it, from *polymathia*, which ſignifies diverſity of ſciences; becauſe ſuch as have their memory burdened with ſeveral kinds of ſciences, are uſually confuſed, and expreſs themſelves ill. M. Huet rather takes the word gallimathias to have had the ſame origin with *alibenum*; and to have firſt ariſen at the time when all the pleadings at the bar were in Latin. There was a cauſe, it ſeems, upon the carpet, about a cock, belonging to the plaintiff Matthias; the counſel in the heat of his harangue, by often repeating the words *gallus* and *Matthias*, happened to blunder; and, inſtead of ſaying *gallus Matthiæ*, ſaid *galli Matthias*; which at length became a general name for all confuſed, embroiled language and diſcourſe.

GALLIMAWFRY, a ragou, hatche, or hotch-pot, made of the remains of ſeveral kinds of meats.

The word is French, *gallimafrée*, which ſignifies the ſame.

Hence the word is alſo uſed in a figurative ſenſe for a piece, or compoſition, of ſeveral different parts, ill digeſted and embarraſſed.

GALLINA, in *Ornithology*, the name of ſeveral ſpecies of *Scolopax*, *Pſophia*, and *Tetrao*; which ſee reſpectively.

GALLINÆ, in the Linnæan ſyſtem of *Ornithology*, the name of a large order of birds, the general character of which is, that their beak is convex; the upper mandible is arched, and extends beyond the lower; the noſtrils are half covered with a cartilaginous convex membrane; the feathers of the tails are more than twelve, and the feet are cloven; but the outermoſt and inner toes are connected by the firſt joint of the middle toe by a ſmall membrane. The *Otis*, *Struthio*, *Didus*, *Pavo*, *Meleagris*, *Penelope*, *Crax*, *Phaſianus*, *Numida*, and *Tetrac*, belong to this order.

GALLINACEOUS, the name of a ſpecies of birds of the pheaſant kind, including the common cock and hen, the characters of which are theſe. The beak is ſhort, ſtrong, and a little crooked, proper for the picking up of corn, which is the food of the whole ſpecies; the body is large, thick and fleſhy; the wings are ſhort and hollowed, and not calculated for much flying; they all breed a numerous progeny; they build on the ground; the young are not fed by the parent, but immediately ſhift for themſelves; and ſome have long ſpurs behind their legs. See COCK, FOWL, and POULTRY.

GALLINAGINIS CAPUT, in *Anatomy*. See CAPUT.

GALLINAGO, a general name for heath fowls, as the wood-cock, ſnipe, &c. See SCOLOPAX.

GALLINAGO *Minor*. See SCOLOPAX and SNIPE. See alſo RALLUS.

GALLINARE, in *Geography*, a ſmall iſland in the Mediterranean, near the coaſt of Genoa; 10 miles S. of Finale. N. lat. 44° 2′. E. long. 8° 25′.

GALLINAS, LAS. See BISSAGOS.

GALLINAZO, in *Ornithology*. See VULTUR *Aura*.

GALLINE, in *Ichthyology*, a name given by the Maſſilians to the flying-fiſh, called by authors *milvus* and *lucerna*. See TRIGLA *lucerna*.

GALLINE, in *Geography*, a river of America, which runs into lake Michigan. N. lat. 42 23′. W. long. 86° 21′.

GALLING, in *Medicine*, inflammation and excoriation of the ſkin by friction. See INTERTRIGO.

GALLINI, *Sir* JOHN, in *Biography*, a native of Italy, a celebrated ſtage-dancer and dancing-maſter, ſome time patentee of the Opera houſe, and always proprietor of the concert rooms in Hanover-ſquare, from the time that he fitted them up for Bach and Abel's ſubſcription concerts till his death.

He came into this country early in life, after having obtained conſiderable diſtinction as a dancer at Paris. He ſeems to have come hither on ſpeculation, without any previous engagement. He firſt appeared on our Opera ſtage in 1759, during the performance and management of the Colomba Mattei; where his ſtyle of dancing pleaſed ſo much, that in a pas ſeul he was frequently encored, which we never remember to have happened to any other dancer.

We find, in a collection of the *libretti*, or opera books of the words, that he performed in 1759 in the opera of "Farnaſe," compoſed by Perez, where he is ſtyled, "Il Signor Giovanni Andrea Gallini, director of the *balli*, and principal dancer." He has the ſame titles in the operas of "Erginda" and "Ciro Riconſciuto," of the ſame year, and "La Clemenza di Tito," 1760, all compoſed by Cocchi. In 1761 Gherardi was ballet-maſter and principal dancer at the Opera. But in 1762, Gallini's name appears again in the opera books; and in 1763, in the comic operas of "La Calamita de' Cuori," and "La Finta Spoſa," in which the De Amices ſung and acted ſo admirably, we find Gallini dancing with the Aſſelin. After this his name no longer appears in books of the lyric theatre, either as ballet-maſter or principal dancer.

It was ſoon after his profeſſional celebrity at the Opera houſe that he married lady Elizabeth Bertie, ſiſter of the late earl of Abingdon, whoſe father, in 1727, married at Florence the daughter of ſir John Collins, knight, of a family originally Engliſh; but which had long reſided in Italy. Signor Collino, brother to the then counteſs of Abingdon, was the laſt performer on the lute in this country. The earl, his brother-in-law, died in 1760, and his counteſs in 1763. The late lord Abingdon, celebrated at Geneva by Voltaire, we believe, was not in England at the time of his ſiſter lady Betty's marriage with Gallini; who, admitted at firſt as a dancing-maſter, by his vivacity, talents, knowledge of the Italian language, and manners, ſo inſinuated himſelf into the favour of this noble family, as ſoon to be admitted as *amico della caſa*, and afterwards to a cloſer alliance.

Many ridiculous ſtories were in circulation at the time, of Signor Gallini's expectations of the honours which would accrue to him by his marriage into a noble family; which he imagined would confer on him the title of my lord. But he was ſoon convinced of his miſtake, and content with an inferior title: for when the marriage became a ſubject of converſation, we happened to hear in the gang-way of the Opera pit the following converſation. One of two ladies, going into the front boxes, ſays to the other, "It is reported that one of the dancers is married to a lady of quality;" when Gallini, who happened to be in the paſſage near the lady who ſpoke, ſays, "Luſtriſſima, ſon io."—"And who are you?" demanded the lady; "Eudenza, mi chiamo Signor Gallini Eſquoire."

This match, as is uſual with ſuch diſproportioned alliances, was not the ſource of permanent felicity. They lived aſunder many years. Lady Elizabeth died in the courſe of the year 1788.

By his great benefits at the theatre, and faſhion as a dancing-maſter at the principal ſchools and houſes of the nobility and gentry, he, with unwearied diligence and exceſſive parſimony, had accumulated a fortune ſufficient to purchaſe in 1786 the patent of the Opera houſe, when he became ſole *impreſario* of that theatre.

It was after this period, in going to Italy to engage performers, that he obtained his title at Rome of the pope, who made him "Cavaliere del ſperon d'Oro," knight of the golden

golden ſpur, the only order which his holineſs has to beſtow. But lord Kenyon, when his title was introduced in court on a trial, refuſed to acknowledge it, and treated the aſſumption with indignation and contempt. Sir John, however, continued to retain it, and was abetted by the public, in ſpite of the lord chief juſtice.

The chevalier, extremely worldly, dextrous at a bargain, and cautious in his dealings with mankind, was an unfortunate projector in his attempt at a rapid increaſe of his property. The rooms in Hanover-ſquare, we believe, were very productive, as he let every floor and every room, not only to concerts, balls, and aſſemblies, but to exhibitions, lectures, and lodgers of all kinds, ſcarcely allowing himſelf a habitable apartment for his own reſidence.

When the Opera houſe was burned down, in 1789, he advanced 30,000*l.* towards rebuilding it, and ſent an architect to Italy to procure plans of all the great theatres of that country, out of which to chooſe the moſt eligible for the new conſtruction; but it has been ſaid, and generally believed, that by ſome jumble of claſhing intereſts, or chicane of law, the management was taken out of his hands, and he not only loſt his power but his money.

While the great theatre in the Haymarket was rebuilding, ſir John fitted up the oppoſite little theatre as a temporary opera houſe, and had Marcheſi and Madame Mara to ſing; but the theatre was ſo ſmall and inconvenient, that it could not contain an audience ſufficient to cover his expences. The next year the Pantheon was transformed into an opera houſe before that in the Haymarket was finiſhed; and the unfortunate knight of the golden ſpur, tired of the ſquabbles and accidents which happened previous to the opening of his new theatre, ſold his patent, and afterwards wholly confined himſelf to the produce of his Hanover-ſquare rooms, and the exerciſe of his profeſſion as a dancing-maſter, to the end of his life.

Indeed, at the time of the French revolution, he could not reſiſt the temptations which were thrown out in that country for turning the penny in the purchaſe of the eſtates of the guillotined and emigrant nobility and gentry under the title of national domains. And he bought an eſtate near Boulogne, which coſt him 30,000*l.*; but of which, by the artifice of French lawyers, and connivance of the uſurpers, he was never able to obtain ſecure poſſeſſion, and at length abandoned all hopes of the eſtate or his money. This loſs had much leſs effect upon his avaricious character than could be expected, conſidering that he was ſo rigid an economiſt, that his private life would furniſh materials for a new drama on the ſubject of frugality.

It has, however, been juſtly ſaid of him, that he was generally conſidered as the moſt able teacher of his art that ever appeared in this country; and is ſuppoſed, by his inceſſant labours in this reſpect, notwithſtanding his great loſſes, to have left money and effects to the amount of 100,000*l.* to portion his family, which conſiſted of a ſon, in the army, and two daughters. He was a very ſhrewd, intelligent man, who perfectly knew the world; and, if he was not generous, he was, however, honourable in his dealings; and if few had cauſe to be grateful for his bounty, no one had a right to complain of his injuſtice.

In the height of his profeſſional practice and favour he publiſhed a book, in which he gave a hiſtory of dancing from its origin, and the manner in which it is practiſed in various parts of the world. It appeared in 1762, under the title of "A Treatiſe on the Art of Dancing, by Giovanni Andrea Gallini, director of the dancers at the Royal Theatre in the Haymarket," 6*s.* bound. Dodſley and Becket. We have not ſeen the original; but in the Monthly Review, for which it has furniſhed an article of 12 pages, there are ſuch copious extracts, that an idea may be formed of the work, which, till the more elegant "Lettres ſur la Dance of the celebrated ballet-maſter, Noverre," publiſhed at Stutgard in 1760, had penetrated into this country, was much read and talked of as a literary performance. Neither Gallini nor the reviewers mention Noverre's captivating book, which, perhaps, neither had ſeen; but unluckily, in a work of M. Cahuſac, publiſhed at the Hague, in three ſmall volumes, 1754, 12mo. we find all the hiſtorical part of Gallini's treatiſe, with the ſame ſtories of the wonderful powers of the ancient mimics Bathyllus and Pylades, at Rome, their quarrel, and the feuds it occaſioned. But, to ſay the truth, we, who knew Gallini from his firſt arrival in England, never thought that he had literature ſufficient to write an original work in his own language, or even to tranſlate ſuch a one as that of Noverre or Cahuſac into any language. The title of this laſt is, "La Danſe ancienne et moderne, ou Traité Hiſtorique de la Danſe."

The late active and enterpriſing artiſt, Gallini, ſeems to have had a pleaſure in his profeſſional labours to the end of his life, like Marſeille, the celebrated dancing-maſter in France, and Cavalry in England, who continued to give leſſons on their art when they had not a leg to ſtand on, much leſs with which to exemplify graceful motion. But Gallini, by temperance and exerciſe, enjoyed a good ſtate of health, and eſcaped decrepitude to the laſt: for it was ſaid in the printed accounts that "Sir John Gallini, on Saturday, 5th of January, 1805, rung his bell at eight o'clock, and, upon his ſervant entering his chamber, ordered his breakfaſt to be prepared immediately, his chaiſe to be at the door at nine o'clock, and his chariot in waiting at three." A few minutes after giving theſe directions, he complained of not being well, and ſaid, "I will reſt till nine o'clock." In half an hour he rang his bell again, and ordered medical aſſiſtance, as he had a violent pain in his ſtomach. Dr. Hayes and Dr. Wood immediately attended; but at nine o'clock he expired without a groan.

GALLINULE, in *Ornithology*, a diviſion of the genus *Fulica*, which ſee.

GALLINULA *Ærythropus*, a name given by many authors to the bird commonly called in Engliſh the *red-ſhank*. See SCOLOPAX *Calidris*.

GALLINULA *Hypoleucos*, a name given by ſome authors to the becaſſine, or, as we call it in Engliſh, the *ſandpiper*. See TRINGA *hypoleucos*.

GALLINULA *Melampus*, a name given by Geſner and ſome others to the bird more uſually known by its German name, *rotknuſſel*. See GLAREOLA *nævia*.

GALLINULA *Rhodopus*, *phœnicopus*, and *ochropus*, names by which Geſner, and ſome others, have called the common tringa; a bird in which the legs are, at different ages, and in the different ſexes, greeniſh, yellowiſh, or reddiſh. See TRINGA *Ochropus*.

GALLINULA *Serica*, a name given indiſcriminately by many authors to the grinetta and the water-rail; both birds of the moor-hen kind, but ſmaller than the common moor-hen. See FULICA.

GALLIO, in *Scripture Biography*, was proconſul, or, as it is in our tranſlation, deputy, of Achaia in the firſt century of the Chriſtian era. He was elder brother of Seneca the ſtoic philoſopher, and as his brother deſcribes his character (Nat. Queſt. l. iv. in præf.) a man of much wit and good ſenſe, of a ſweet and gentle diſpoſition, and of much generoſity and virtue. The apoſtle Paul was brought before him in the year of our lord 52 or 53; but it was

impoſſible for the enemies of the apoſtle to move him to give any judgment on the caſe. Acts, xviii. 11 — 16.

GALLIO, in *Geography*, a town of Italy, in the Vicentin; 20 miles N. of Vicentin.

GALLION, or GALLEON, formerly denoted a large veſſel, or ſhip of war, of three or four decks.

GALLEON is now only uſed in ſpeaking of the Spaniſh fleet; the galleons being a part of the ſhips employed in the commerce of the Weſt Indies.

The Spaniards have been accuſtomed to ſend every year two fleets; the one for Mexico, which they call the flota; and the other for Peru, which they call the galleons.

GALLEON, *Manila*, is a ſhip employed in the trade from Manila in the iſland of Luconia, the chief of the Philippine iſlands, to Acapulco on the coaſt of Mexico. This ſhip ſets ſail from Manila about July, and arrives at Acapulco in December, January, or February following. There is ſeldom more than one ſhip employed in this trade at a time; but there are three or four ſtout ſhips provided to carry on this commerce, one of which is always ready for the ſea when the other arrives. The largeſt of theſe ſhips is little leſs than one of our firſt rate men of war, and carries twelve hundred men; the others are of the burthen of twelve hundred ton and upwards, and carry from three hundred and fifty to ſix hundred men, with between fifty and ſixty guns. Theſe ſhips are commiſſioned and paid by the king of Spain, who pays the officers and crew; and one of the captains is called the general, and carries the royal ſtandard of Spain at the top-gallant-maſt-head. The trade from Manila to Acapulco conſiſts of ſuch commodities, collected in China and different parts of India, as are intended to ſupply the kingdoms of Mexico and Peru. Theſe are ſpices, all ſorts of Chineſe ſilks and manufactures, particularly ſilk ſtockings, of which the annual ſhip uſually carries no leſs than fifty thouſand pair, vaſt quantities of Indian ſtuffs, as calicoes and chints, together with other minuter articles, as goldſmith's work, &c. which is performed at Manila by the Chineſe, of whom there are no leſs than twenty thouſand who conſtantly reſide there. However this trade is not open to all the inhabitants of Manila, but is reſtrained by regulations ſimilar to thoſe of the regiſter ſhips from Cadiz to the Weſt Indies. The value of this trade is limited by the royal edicts, as it has been ſaid by ſome, to ſix hundred thouſand dollars; but it is reaſonable to conclude that the return of it cannot be much ſhort of three millions of dollars. The tonnage of the ſhips employed in this trade is divided into a certain number of bales of the ſame ſize, which are diſtributed among the convents at Manila, but principally to the Jeſuits for the ſupport of their miſſions; and theſe convents have a right to embark ſuch a quantity of goods on board the Manila ſhip, as the tonnage of their bales amounts to, or to ſell this privilege to others. This ſhip, having diſpoſed of its effects at Acapulco, returns for Manila ſome time in March, where it generally arrives in June; ſo that the whole voyage takes up near a year. The principal return from Acapulco to Manila is always made in ſilver, the reſt of the cargo being inconſiderable, and conſiſting of cochineal and ſweet-meats, the produce of the American ſettlements, European millinery ware for the women at Manila, and ſome Spaniſh wines, as tent and ſherry, which are intended for the uſe of their prieſts in the adminiſtration of the ſacrament. The galleon in its return is much leſs incumbered with her cargo than in her paſſage thither; and therefore her crew is conſiderably augmented and her lower tier of guns is mounted, which before was carried in her hold, at leaſt till ſhe came near cape St. Lucas and California, and apprehended an enemy. Anſon's Voyage, chap. x. p. 232—248.

Theſe are all ſhips of war, and go on the king's account; but they are ſo loaden and embarraſſed with merchandizes, that, in caſe of an attack, they find it difficult to defend themſelves.

Beſide the king's galleons, there are uſually twelve or ſixteen merchants ſhips, called regiſter ſhips, belonging to private perſons, who obtained leave for the ſame, or rather buy it; there being no Weſt India company in Spain.

The galleons are loaded at Cadiz, from whence they may put out at any time. They were formerly appointed to be out in January, that they might coaſt along the firm land, and come about the middle of April to Porto Bello, where, the fair being over, they might take aboard the plate, and be at the Havannah with it about the middle of June, where the New Spain fleet would ſoon join them, and they might come together more ſafely to Spain. For this purpoſe, the viceroy of Peru was to take care that the plate ſhould be at Panama by the middle of March; the plate is fifteen days in removing from Potoſi to Arica; eight days generally from thence, by ſea, to Callao, and twenty from Callao to Panama, taking in by the way the plate at Faita and Truxillo. But it has been found by experience, that the month of September is the fitteſt for the fleet to ſail: they are about two years in the whole voyage. However often or ſeldom the galleons go out, the next fleet never go out till the laſt are returned. When the galleons and flota put out together, they ſeparate about the Antilles iſlands; the galleons for Carthagena and Porto Bello: and the flota for Vera Cruz. At their return, they rejoin at the Havannah in the iſle of Cuba.

The loading of the galleons is always the richeſt: an eſtimate of the yearly returns or cargoes, both of the flota and galleons, was formerly as follows:

Of gold, the galleons bring yearly about two or three millions of crowns, and the flota about one. Of ſilver, the galleons bring eighteen or twenty thouſand crowns, and the flota ten or twelve. Of precious ſtones, the galleons bring as follow: two hundred thouſand crowns worth of pearls; two or three hundred thouſand crowns of emeralds; and twenty or thirty thouſand crowns worth of bezoards, amethyſts, and other ſtones of leſs value: the flota brings none at all. Of wools, the galleons bring forty or fifty thouſand crowns: the flota, none. Of quinquina, the galleons bring the value of twenty thouſand crowns: the flota, none. Of ſkins and leather, the galleons bring ſeventy thouſand crowns worth: the flota as much. Of Campechy wood, the galleons bring ſixty thouſand crowns worth: the flota, none. Of ſkins and leather from Buenos Ayres, the regiſter-ſhips may bring to about two hundred thouſand crowns; of cochineal about a million of crowns; and of indigo, about ſix hundred thouſand crowns.

By a general ordinance in Spain, it has been eſtabliſhed that there ſhould be twelve men of war and five tenders fitted out annually for the armada of galleons; eight ſhips of ſix hundred tons burthen each; and three tenders, one of a hundred tons, for the iſland Margarita; and two of eighty each to follow the armada. For the New Spain fleet two ſhips of ſix hundred tons each, and two tenders of eighty each; and for the Honduras fleet, two ſhips of five hundred tons each; and in caſe no flota happened to ſail any year, three galleons and a tender ſhould be ſent to New Spain for the plate.

But the number of galleons has been different at different times; it has increaſed in time of war and diminiſhed in time of peace.

GALLIOPOLIS, in *Geography*, a poſt-town in the ſtate of Ohio, ſituated on the high north bank of the river Ohio, nearly 90 miles below Marietta, and three miles below the mouth of the Great Kanhaway; ſaid to contain about 100 houſes, inhabited by French people, who built it in the year 1792. They laid out gardens and encompaſſed them with hedges; and planted vineyards and orchards, which have been productive. The firſt ſettlers found the ſituation unhealthy, and endangered by the Indian war in its vicinity, and after a reſidence of about four years diſperſed to other ſettlements, and particularly to Louiſiana. Thoſe who remained obtained of Congreſs a grant of 20,000 acres, about 24 miles lower down the river, oppoſite to Little Sandy Creek, whither they removed. It is diſtant about 240 miles E. of Columbia, and 559 S. W. of Philadelphia. N. lat. 38° 49′ 12″. W. long. 83° 9′.

GALLIOT, a ſmall galley or a ſort of brigantine, built very ſlightly, and deſigned only for chace.

She hath but one maſt, and can both ſail and row. She uſually carries two or three pedreros, and hath ſixteen or twenty oars.

Some alſo call the bomb-ketches galliots.

GALLIPOLI, in *Geography*, a ſea-port town of European Turkey, in Romania, on the ſea of Marmora, with a good harbour; the reſidence of a pacha, and the ſee of a Greek biſhop, ſuffragan of Heraclea; taken from the Chriſtians in the year 1357 by Soliman, 80 miles S. of Adrianople, and 108 W. S. W. of Conſtantinople. N. lat. 40° 24′. E. long. 26° 44′.

GALLIPOLI, a ſea-port town of Naples, in the province of Otranto, ſeated on a rock; ſurrounded by the ſea and connected with the land only by a bridge; the ſee of a biſhop, ſuffragan of Otranto. The chief articles of its commerce are olives and cotton, produced by trees which are planted in its environs; but the oil not being of the beſt kind, is principally purchaſed for manufactures, 25 miles W. S. W. of Otranto. N. lat. 40° 29′. E. long. 15° 58′.

GALLITRICHUM, in *Botany*, a name by which ſeveral authors call the *horminum ſativum*, or garden-clarey.

GALLIVATS, in *Naval Language*, are large row-boats uſed in India. They are built like *Grabs* (which ſee), but of ſmaller dimenſions; the largeſt rarely exceeding 70 tons. They have two maſts, of which the mizen is very ſlight; the main-maſt bears only one ſail, which is triangular, and very large, the peak of it, when hoiſted, being much higher than the maſt itſelf. In general, theſe veſſels are covered with a ſpar-deck, made for lightneſs of ſlit bamboos; and they carry only pettararoas, which are fixed on ſwivels in the gunnel of the veſſel; but thoſe of the largeſt ſize have a fixed deck, on which they mount ſix or eight pieces of cannon, from 2 to 4-pounders; they have 40 or 50 ſtout oars, and may be rowed four miles an hour.

GALLIUM. See GALIUM.

GALLO, or PUNTA DE GALLO, in *Geography*, a ſmall iſland in the Pacific ocean, near the coaſt of Peru, which furniſhes veſſels with wood and water, but is uninhabited. N. lat. 2° 28′. W. long. 76° 47′.

GALLO, a country of Africa, in the Indian ſea, about S. lat. 17°.

GALLO, *Cape*, a cape on the N. coaſt of Sicily. N. lat. 38° 17′. E. long. 13° 2′.—Alſo, a cape on the S. coaſt of the Morea. N. lat. 36° 48′. E. long. 21° 53′.

GALLOGLASSES, a kind of militia or ſoldiery, in Ireland.

Camden, in his "Annals of Ireland," p. 792, relates, that the Iriſh militia conſiſts of cavalry, or horſemen, called galloglaſſes, or galloglaſſii, who uſe a very ſharp ſort of hatchet: and infantry, called kernes.

GALLOMEW, in *Geography*, a town of Pegu, on the Ava; 60 miles S. of Lundſay.

GALLON is either a *Meaſure* or a *Weight*, of both of which there are ſeveral diſtinct kinds in uſe in England, *viz.*

GALLON *of Ale, Beer, or Vinegar Meaſure*, according to the acts of the 12th of Hen. VII. and 12th of Charles II., &c. often called the Wincheſter gallon, contains, or is equal to 4 ale quarts = 8 ale pints = 32 ale gills = 282 cubic inches Engliſh = .1631944 cubic feet = .00604424 cubic yards = 1.220779 wine gallons = 1.049107 dry gallons = .1311384 malt buſhels = .5676408 cubic links. It has been ſaid that this gallon ſhould hold 10$\frac{1}{2}$lb. of pure water?

GALLON *of Malt*, or *Dry Meaſure*, = $\frac{1}{8}$ of a malt buſhel, according to the firſt and ſubſequent acts for levying a duty on the making of malt; it contains 2 pottles = 4 dry quarts = 8 dry pints = 268.8 cubic Engliſh inches = .155555 cubic feet = .005761317 cubic yards = 1.163636 wine gallons = .9531914 ale gallons = .5410704 cubic links. It has been ſaid that this gallon holds 8lb. Troy of good dry wheat, or 46080 of ſuch grains of wheat, or 9.7187lb. of pure water.

GALLON *of Wine, Cyder, Spirits, Oil, Milk, &c.* according to the act of the 5th of Ann. chap. 7. ſect. 7. contains 4 wine quarts = 8 wine pints = 32 wine gills = 231 cubic Engliſh inches = .1336806 cubic feet = .004951132 cubic yards = .8191490 ale gallons = .8593750 dry gallons = .1074219 malt buſhels = .4649823 cubic links. The act of 1706 directed the wine gallon to be a cylinder of 7 inches diameter, and 6 deep, which contains 230,907 inches, or 231 as above. It has been ſaid to hold 8.3542lbs. of pure water? Caſks for packing fiſh, beef, and pork are to be meaſured or gauged by the wine gallon, by the 38 Geo. III. chap. 89.

GALLON, *Apothecaries*, or *Congius*, in *Pharmacy*, = 8 pints = 128 ounce-meaſures = 1024 dram-meaſures = 231 cubic inches, or the wine gallon, as above. In the tranſlation of the Pharmacopeia by Dr. Powell, the gallon or congius = 8 pints; the pint = 16 fluid-ounces; the fluid-ounce = 8 fluidrachms; and the fluidrachm = 60 minims. With regard to meaſures, the ſtandard wine gallon of the exchequer is divided into 61,440 parts, now called *minims*, according to the glaſs meaſures originally invented by the late Mr. Timothy Lane, F.R.S. By 14 Ann. the wine gallon is fixed at 231 cubic inches, and the weight of the ſtandard exchequer gallon of water, at a temperature of 63° and barometrical preſſure = 29.52, is 58,176 Troy grains. The proportional meaſures are as follow: *viz.* 1 pint = 16 fluid-ounces = 128 fluidrachms = 7680 minims; and 1 fluid-ounce = 8 fluidrachms = 480 minims: and 1 fluidrachm = 6 minims.

GALLON, *Scotch*, = 4 Scotch quarts = 8 Scotch pints = 16 chopins = 32 mutchkins = 128 Scotch gills. The pints in different parts of Scotland, or according to the determination of different experimenters, (from whence they raiſe or deduce their other meaſures of capacity,) are very various; we have ſeen 796.48, 827.2, 828, 840, 869.312, 872, and perhaps others, at different times, ſtated, as the number of Scotch cubic inches in their pint.

GALLON, a *Weight*, is 12lb. of honey at the cuſtom-houſe; of train oil 7$\frac{1}{2}$lb. make a gallon; and of coal, in the port of Newcaſtle, according to Mr. Eddington, "Eſſay on the Coal Trade, 1803," p. 51, 6.87lbs. avoirdupoiſe, or $\frac{33}{16}$ths of a Wincheſter peck, ſtricken or level meaſure,

make a gallon, in calculating the tonnage of veſſels on the Tyne river.

A gallon of wheat formerly (9th Hen. III. 51ſt Hen. III. 12th Hen. VII. &c.) or 8 pints, was 8lbs. Troy = 6.5828lbs. of our avoirdupoiſe weight.

GALLONIUS, ANTHONY, in *Biography*, a native of Rome, where he died in 1605. He excelled in theology, and was prieſt of the congregation of the oratory. His works, which were numerous, were connected with his profeſſion, but he is chiefly known by "A Treatiſe on the different Kinds of Cruelties inflicted by the Pagans on the Martyrs of the primitive Church, illuſtrated with Engravings of the Inſtruments of Torture made uſe of by them." This work was firſt publiſhed in Italian in the year 1591: it was compiled, not only from the accounts of the acts of the martyrs, many of which are of unqueſtionable authority; but alſo from ancient authors of indiſputable credit, profane as well as eccleſiaſtical. In 1594, the author tranſlated his work into the Latin language, and publiſhed it at Rome, under the title "De Sanctorum Martyrum Cruciatibus, &c." illuſtrated with wood cuts. It has ſince gone through many editions on the continent. Moreri. Bayle.

GALLOO, in *Geography*, a town of Africa, in Bambarra. N. lat. 14° 43'. W. long. 5° 10'.

GALLOON, in *Commerce*, a thick narrow kind of ferret ribband, or lace, uſed to edge or border cloaths.

The term is ordinarily underſtood of that made of wool; ſometimes that of thread, or even gold or ſilver.

GALLOP, in the *Manege*, is the ſwifteſt natural pace of a horſe, performed by reaches or leaps; the two fore-feet being raiſed almoſt at the ſame time; and when theſe are in the air, and juſt ready to touch the ground again, the two hind-feet are lifted almoſt at once.

The word is borrowed from the barbarous Latin *calupare*, or *calpare, to run*. Some derive it from *caballicare*; others from the Greek καλπαζειν, or καλπαν, *to ſpur a horſe*.

In galloping, the horſe may lead with which fore-leg he pleaſes; the moſt uſual way is that with the right, in which caſe the gallop is ſaid to be *juſt*; but which-ſoever it be, the hind-leg of the ſame ſide muſt follow it next, which forms an *even* or *equal* gallop; otherwiſe the legs are ſaid to be *diſunited*, and the gallop to be *falſe*; to remedy which diſorder, the rider muſt ſtay the horſe a little on the hand, and help him on the ſpur on the contrary ſide to that on which he is diſunited.

However, this rule has not been always ſtrictly obſerved; for hunting horſes have been trained to lead indifferently with both legs, becauſe it has been found, that a horſe which has never been ſuffered to gallop but with his right fore-leg, has been worn out on one ſide, when he has been freſh and ſound on the other. In order to make a ſtop in a gallop ſtraight forwards, the rider ſhould carefully put his horſe together, without altering or diſturbing the appuy, and throw his body back a little to accompany the action, and to relieve the horſe's ſhoulders. In doing this, he ſhould ſeize the time of making the ſtop, keeping the hand and body quite ſtill, exactly when he feels the horſe put his fore-feet to the ground, in order that by raiſing them immediately by the next motion which he makes, he may be upon his haunches. When horſes do not put out their ſtrength ſufficiently, they ſhould be gallopped briſkly, and then ſlowly again by turns, and they will thus be compelled to obey the hand and heel. In the ſlow gallop, as well as in the trot, it is ſometimes neceſſary to cloſe the heels to the horſe's ſides, which is called *pinchery*; but this ſhould be done in ſuch a manner as not to make the horſe abandon himſelf upon the hand, and care muſt be taken that he be upon his haunches, and not upon his ſhoulders: and, therefore, when he is pinched, he ſhould be kept in the hand. To put a horſe well together, and make him bring his hinder legs under him, the rider muſt cloſe his legs upon him, putting them very much back; this will oblige him to ſlide his legs under him; at the ſame inſtant let the hand be raiſed a little to ſupport him before, and yielding again immediately. Let him be thus ſupported, and have the rein again from time to time, till he begins to play and bend his haunches, and gallops leaning and ſitting down, as it were, upon them; let the rider then preſs him with the calves of his legs, and he will thus become quick and ſenſible to the touch. If a horſe has too fine a mouth, gallop him upon ſloping ground; this will oblige him to lean a little upon the hand, in order the better to put himſelf upon the haunches; and through fear of hurting his bars, he will be prevented from reſiſting the operation of the bit. If the horſe is heavy in hand, gallop him up ſloping ground; and when his appuy is too ſtrong, this will lighten him. The gallop ſerves to aſſure and make ſteady a weak and delicate mouth, and alſo to ſupple a horſe and make him ſteady and active in his limbs. Berenger's Hiſt. and Art of Horſemanſhip, vol. ii. p. 104. &c.

In a circle the horſe is confined always to lead with his fore-leg, within the turn; otherwiſe he is ſaid to gallop *falſe*. But here, too, the hind leg of the ſame ſide muſt follow.

We ſay, a *hand-gallop*, a *Canterbury-gallop*, a *ſchool-gallop*, &c. A ſmooth gallop, cloſe to the ground, the French call the Engliſh gallop, *galop à l'Angloiſe*.

GALLOP *Iſlands*, in *Geography*, a cluſter of ſmall iſlands in the river St. Lawrence. N. lat. 44° 55'. W. long. 75° 18'.

GALLOPAVO, the *Turkey*, in *Ornithology*, a ſpecies of *Meleagris*; which ſee.

GALLOPER, in *Artillery*, is the name of a carriage which ſerves for a pound and a half gun. This carriage has ſhafts ſo as to be drawn without a limber, and is thought by ſome to be more convenient and preferable to other field carriages; and it may likewiſe ſerve for our light three and ſix pounders. See CARRIAGE.

GALLOT, in *Ichthyology*, the *Wraſſe*. See LABRUS *tinca*.

GALLOWAY, in *Geography*, a diſtrict of Scotland, comprehends the two ſhires or ſtewartries of Kirkcudbright and Wigton; for an account of which ſee under their reſpective names.

GALLOWAY, *New*, a royal burgh in the ſtewartry of Kircudbright, is ſeated in a vale, on the banks of the Ken river. From its centrical ſituation its market is much frequented. King Charles I. created it a royal burgh, and advanced the lord of the manor, ſir John Gordon, to the title and dignity of viſcount Kenmure. In the year 1793 this place contained 480 inhabitants.

GALLOWAY, a townſhip of America, in Glouceſter county, New Jerſey.

GALLOWAY, *Mull of*, a cape of Scotland, on the ſouth coaſt of the county of Wigton, at the eaſt entrance into Glenluce bay. N. lat. 54° 44'. W. long. 4° 56'.

GALLOWAYS, is the name of a peculiar ſort of horſes, ſo called from the county of Galloway in Scotland, where they are bred. Tradition reports that this kind of horſes ſprung from ſome Spaniſh ſtallions, which ſwam on ſhore from ſome of the ſhips of the famous Spaniſh Armada, wrecked on the coaſt; and coupling with the mares of the country, furniſhed the kingdom with their poſterity. They were much eſteemed,

eſteemed, and of a middling ſize, ſtrong, active, nervous, and hardy. Berenger's Hiſt. and Art of Horſemanſhip, vol. ii. p. 205.

Galloway *Dyke*, in *Agriculture*, a ſort of fence that is compoſed of earth and ſtone. See Fence.

GALLOWS, an inſtrument of puniſhment, whereon perſons convicted capitally of felony, &c. are executed by hanging.

Among our anceſtors it was called *furca*, a *fork*: a name by which it is ſtill denominated abroad, particularly in France and Italy. In this latter country, the reaſon of the name ſtill ſubſiſts; the gallows being a real fork driven into the ground, acroſs the legs whereof is laid a beam, to which the rope is tied.

Gallows, in *Rural Economy*, a term applied to a ſort of wooden frame formed by nailing pieces of timber together in a tranſverſe direction, and which is employed for different uſes.

Gallows *of a Plough*, ſignifies that part of it which is called the head, and that conſiſts of three pieces of timber, one of which is placed tranſverſely over the heads of the other two, ſo as to have ſomewhat the appearance of a common gallows. See Plough.

GALLS, or Gall-*Nuts*. See Gall and Gall-*Nut*.

Galls, in *Agriculture*, a term uſed to ſignify the baſe or vacant ſpots in crops of grain.

GALLSTAD, in *Geography*, a town of Sweden, in Weſt Gothland; 50 miles E. of Gothenburgh.

GALLUS, Cornelius, in *Biography*, a Roman of conſiderable rank in life, and celebrated as a man of letters and poet. He was born about the year 69 B. C. Little is known of the events of his life; the moſt intereſting occurrence was, perhaps, his intimacy with Virgil, who is thought to have been introduced to Mæcenas by his means. That poet has inſcribed his 10th eclogue to Gallus, whoſe deſertion by Lycoris is the ſubject of the compoſition. Gallus was paſſionately fond of his ſlave Lycoris, and wrote four books of elegies to her honour, which became very popular, and which raiſed him to conſiderable reputation for this kind of verſe. He is referred to by Ovid as having eſtabliſhed an immortal celebrity:

> "Gallus from Eaſt to Weſt ſhall ſpread his name,
> And fair Lycoris ſhare her poet's fame."

He is mentioned alſo with [illegible] Propertius, Martial, and other writers of antiquity. Lycoris was probably a feigned name for Cytheris, who captivated Marc Antony. Gallus, as well as the other poets of the age, was in high favour with Auguſtus, by whom he was appointed to the government of Egypt after the death of Antony and Cleopatra. His future conduct proved that he was unworthy of this high honour. He forgot the duties of his office, and, ungrateful for the diſtinguiſhed favours of his ſovereign, he conſpired againſt his government and authority, and pillaged the province, for which he was baniſhed by the emperor. This diſgrace operated ſo powerfully upon him, that he killed himſelf in deſpair A. D. 26. Some fragments of his poetry remain, which prove that he excelled in elegiac compoſition. He tranſlated into Latin verſe ſeveral books of the Greek poet Euphorbion. Virgil is ſaid to have written an eulogium on his friend, and inſerted it at the end of his Georgics, but that through fear of Auguſtus he ſuppreſſed it, and ſubſtituted the epiſode reſpecting Ariſtæus and Eurydice. Moreri. Suetonius, &c.

Gallus, C. Vibius Trebonianus, emperor of Rome, roſe to that high office, from being one of the chief commanders under Decius, at the time when that emperor loſt his life in an action with the Goths. He aſcended the vacant throne in the year 251, and diſplayed his attachment to the memory of his former maſter by placing him in the rank of the gods, and by aſſociating his ſurviving ſon Hoſtilianus with him in the empire. At this period the Goths overwhelmed the empire, and Gallus was obliged to purchaſe the retreat of theſe formidable enemies by ſuffering them to retain their booty and captives, and agreeing to pay them an annual tribute. The emperor, having accompliſhed this object, returned to Rome, where he abandoned himſelf to an effeminate and voluptuous life, which rendered him contemptible and odious to his ſubjects. The public calamities were aggravated by a terrible peſtilence, which carried off numbers of people, and among them probably the young emperor, his coadjutor, Hoſtilianus. The death of the prince was, however, imputed to Gallus, and, having once given vent to their ſuſpicions, the people now imputed the calamities of the former reign to the perfidious councils of the preſent emperor. The tranquillity which the empire enjoyed during the firſt year of Gallus's adminiſtration ſerved to inflame rather than appeaſe the public diſcontent, and as ſoon as the apprehenſions of war were removed, the infamy of peace was more deeply felt; and the more ſo when it was diſcovered that they had not thereby even ſecured their repoſe, though it had been purchaſed at the expence of their honour. "The dangerous ſecret," ſays the hiſtorian, "of the wealth and weakneſs of the empire had been revealed to the world. New ſwarms of barbarians, encouraged by the ſucceſs, and not conceiving themſelves bound by the obligation of their brethren, ſpread devaſtation through the Illyrian provinces, and terror as far as the gates of Rome." The defence of the empire, abandoned by the emperor, was aſſumed by Æmilianus, governor of Pannonia and Mœſia, who attacked and vanquiſhed the barbarians, whom he purſued beyond the Danube. In the mean time Gallus was indulging himſelf in all the pleaſures which his country could afford, and was, almoſt at the ſame moment, informed of the ſucceſs obtained over his enemies, and of a revolt of the conquering army. He marched againſt his rival; but when the armies came in ſight of each other, the ſoldiers of Gallus compared the ignominious conduct of their ſovereign with the glory of his rival. A civil war was prevented by the murder of Gallus and his ſon Voluſianus. This event took place the year 253, after he had reigned about two years. Univer. Hiſt. Gibbon.

Gallus, Cæsar, nephew of Conſtantine the Great, was born about the year 326. He with his brother Julian, the former 12, and the latter about ſix years of age, were the only princes of the collateral Flavian race who were ſpared in the maſſacre that took place after the death of Conſtantine. They obtained a precarious and dependent life, from the affected pity of Conſtantius, who was ſenſible that the execution of theſe helpleſs orphans would have been eſteemed by all mankind as an unneceſſary act of the moſt deliberate cruelty. Different cities of Ionia and Bithynia were aſſigned for places of their exile and education, till they arrived at ſuch an age as to excite the jealouſy of the emperor; he then judged it prudent to ſecure the unhappy princes in the ſtrong caſtle of Macellum, near Cæſarea. The treatment which they experienced was partly ſuch as might be expected from a careful guardian, and partly ſuch as they might dread from a ſuſpicious tyrant. At length the emergencies of the ſtate compelled the emperor to inveſt Gallus, in the 25th year of his age, with the title of Cæſar, and to cement this political connection by his marriage with the princeſs Conſtantina. Antioch was now appointed for his reſidence, and he was charged with the government of the eaſtern pro-

vinces, and their defence againſt the Perſians. In this he was ſucceſsful; but either his own bad temper or that of his wife plunged him into all ſorts of extravagancies, and his adminiſtration was marked with moſt deteſtable cruelty, pride, and rapacity. When Conſtantius was appriſed of his conduct, he ſent two delegates to admoniſh him and reform his government: theſe he cauſed to be ſeized, bound, and, after other acts of ignominy, thrown into the river. He now had nothing to expect from the emperor Conſtantius but the ſevereſt puniſhment; he was therefore obliged unwillingly to comply with an invitation to viſit him at Milan. At length he ſet out with a numerous train, but ſoon found himſelf narrowly watched by the imperial miniſters. Upon his arrival at Adrianople, an order met him to leave behind him his retinue and advance with a few poſt-carriages, and, almoſt immediately after, he was arreſted by a military officer, ſtript of his enſigns of dignity, and carried away to impriſonment at Pola in Iſtria. The horror which he felt ſoon increaſed by the appearance of his enemy Euſebius, who proceeded to interrogate him concerning the adminiſtration of the Eaſt. Conſcious of his own demerits, he ſunk under the weight of ſhame and guilt, and confeſſed his criminal actions. The ſentence of death was ſpeedily ſigned, diſpatched, and executed; and the nephew of Conſtantine, with his hands pinioned, was beheaded in priſon like the vileſt malefactor. This cataſtrophe took place in the year 354, the fourth year of his reign. Univer. Hiſt. Gibbon.

GALLUS, in *Ornithology*, the *Cock*, a ſpecies of *Phaſianus*; which ſee. See alſo COCK and POULTRY.

GALLUS *Indicas*, the *Alector*, a ſpecies of *Crax*; which ſee.

GALLUS, in *Ichthyology*, a ſpecies of *Zeus*; which ſee. See alſo ABACATUAJA.—Alſo, a ſpecies of *Labrus*; which ſee.

GALLUS *Marinus*, a name given by many writers to the fiſh called in Engiſh the *doree*, and more commonly in Latin by the name of *faber*, a ſpecies of *Zeus*; which ſee.

GALLUS *Marinus* is alſo a name by which ſome have called the fiſh more frequently known by the name of the *orbis piſcis*.

GALLY, on *Ship-board*, a place in the cook-room, where the grates are put up, fires lighted, and the victuals boiled and roaſted.

GALLY, HENRY, in *Biography*, was born at Beckenham, in Kent, in the year 1606. He was deſtined for the church, and ſtudied with that view at Bene't college, Cambridge; and in 1721 he took his degree of M. A. and was ſhortly after choſen lecturer of St. Paul's, Covent-garden. About the ſame time he was preſented with a rectory in Buckinghamſhire; and in 1725 appointed domeſtic chaplain to the lord-chancellor King, who in 1728 gave him a prebend in the cathedral church of Glouceſter. He now took his degree of doctor in divinity at Cambridge; and ſoon after was diſtinguiſhed by other valuable inſtances of church preferment. In 1735 he was nominated chaplain in ordinary to his majeſty. He died in 1769, leaving behind him ſome ſingle ſermons; a tranſlation of "The Morals of Theophraſtus, with Notes, and a critical Eſſay on Characteriſtic Writing;" "The Reaſonableneſs of Church and College Fines aſſerted, &c.;" "A Diſſertation againſt pronouncing the Greek Language according to Accents;" "A ſecond Diſſertation on the ſame Subject, in anſwer to Mr. Forſter's Eſſay on the different Nature of Accent and Quantity," and other works. Gen. Biog.

GALLY-HEAD, in *Geography*, a cape on the ſouthern coaſt of Ireland, in the county of Cork. W. long. 8° 54'. N. lat. 51° 3'.

GALLY-*worm*, in *Zoology*, an inſect known by moſt writers under the name *julus*. It is a land-inſect with a long body, compoſed of a great number of rings, and furniſhed with a great number of feet. It is found very frequently in gardens, and when touched has the power of rolling itſelf up into a ball.

It has been eſteemed by ſome a valuable medicine in the jaundice, and in ſuppreſſion of urine.

This animal is very common with us among rubbiſh, and is by ſome referred to the ſcolopendræ, but improperly; for though they agree in the great number of legs, our's is a harmleſs animal, and the ſcolopendræ are miſchievous creatures, armed with dangerous forceps. It is ſuppoſed by Liſter that this creature, common with us, would, on diſtillation, yield the ſame ſort of animal acid that is procured from the ant. The reaſon of the conjecture is, that the ant and this creature both agree in emitting a ſharp and pungent ſmell on being bruiſed; but theſe are not eaſily procured in plenty enough to make the experiment, as they are not a gregarious inſect like the ant. Poſſibly ſome more of the inſects may be found, on trial, to have the ſame acid. Phil. Tranſ. N° 68.

GALNEIKIRCHEN, in *Geography*, a town of Auſtria; 5 miles N. of Steyregg.

GALOMBATZ, a town of Servia; 20 miles W.S.W. of Orſova.

GALOPINA, in *Botany*, a name concerning whoſe derivation or meaning its author Thunberg has not vouchſafed to give any account, and which no other perſon has, as yet, ventured to explain. Can it poſſibly be formed out of *Galium*, with the adjective *opina*, *thought of?* Its fructification ſtrongly ſuggeſts to the imagination that of the rough-fruited kinds of *Galium*, both in appearance and character; and Thunberg, from the compariſon which he makes between the two genera, evidently appears to have had this reſemblance in his mind. We only attempt to account for, not to juſtify, the name.—Thunb. Nov. Gen. 3. Schreb. 91. Willd. Sp. Pl. v. 1. 706. Mart. Mill. Dict. v. 2. Juſſ. 198. Claſs and order, *Tetrandria Digynia*. Nat. Ord. *Stellatæ*, Linn. *Rubiaceæ*, Juſſ.

Gen. Ch. *Cal.* none. *Cor.* of one petal, ſuperior, in four revolute ſegments. *Stam.* Filaments four, capillary, ſpreading, inſerted into the receptacle, deciduous; anthers oblong, erect. *Piſt.* Germen inferior, two-grained; ſtyles two, rather ſhorter than the ſtamens, ſubſequently elongated; ſtigmas ſimple. *Peric.* none. *Seeds* two, nearly globoſe, with a prickly coat.

Eſſ. Ch. Calyx none. Corolla four-cleft, ſuperior, revolute. Seeds two, prickly.

1. G. *circæoides* is the only ſpecies which Thunberg recently, in Prodr. Pl. Cap. 32, reduces to the genus *Anthoſpermum*, retaining *galopina* as a ſpecific name. This plant grows in ſeveral woods at the Cape of Good Hope, flowering in December and January, and is deſcribed as follows. "*Root* annual. *Stem* herbaceous, about two feet high, erect but weak, round, red, ſmooth, rarely alternately branched. *Leaves* oppoſite, on foot-ſtalks, oblong, acute, entire, ſmooth, an inch or rather more in length; pale at the back; accompanied by ſome ſmaller axillary leaves. *Panicle* terminal, looſely ſpreading; its ſtalks oppoſite, capillary, ſmooth, bearing pairs of oppoſite briſtle-ſhaped bracteas. *Flowers* of a browniſh green."—This account of the herbage comes very near *Anthoſpermum herbaceum*, Linn. Suppl. 440, which, having been communicated by Thunberg, we preſume is the *lanceolatum* of his *Prodromus*, p. 32, though not there cited. Having never ſeen either a ſpecimen or figure of the *Galopina*,

we

we cannot decide reſpecting its genus. Notwithſtanding Willdenow's ſuggeſtion concerning the fruit of *Anthoſpermum*, we find no generic diſtinction there, Pontedera having apparently deſcribed it wrong. See Schreb. Gen. 679. Juſſieu rightly ſays, "it ſeparates into two ſeeds." By the ſpecific name it ſhould ſeem that *Galopina* has the habit of a *Circæa*, than which nothing can be leſs like an *Anthoſpermum* or a *Galium*. S.

GALOPPE, in *Geography*, a town of France, in the department of the Lower Meuſe, and chief place of a canton in the diſtrict of Maeſtricht. The place contains 1318, and the canton 10,733 inhabitants, on a territory of 137½ kiliometres, in 11 communes.

GALOTS, the loweſt of the falls on the river St. Lawrence, in Canada; between which and the neck of land called La Galette, are an excellent country and foreſts.

GALOTS, *Iſle aux*, an iſland in the river St. Lawrence; 3 leagues beyond l'Iſle aux Chevres, in N. lat. 43° 33′.

GALOUWAH, or GHALVAH, a town of the country of Nubia, ſeated on the Nile.

GALSTA, a town of Sweden, in Weſt Gothland; 23 miles E.N.E. of Uddevalla.

GALTEES, mountains of Ireland, between the counties of Cork, Tipperary, and Limerick, ſome of which are of conſiderable height. They generally conſiſt of a coarſe pudding ſtone, being quartz pebbles of various ſizes, imbedded in a hard argillaceous cement.

GALTELLI, a town of Sardinia, formerly the ſee of a biſhop, but now decayed; 14 miles S. of Lode.

GALTEN, a ſmall iſland on the weſt ſide of the gulf of Bothnia. N. lat. 62° 12′. E. long. 17° 17′.

GALVANI, LEWIS, in *Biography*, from whoſe name the appellation of *Galvaniſm* was given to a ſuppoſed new principle in nature, which has been alſo called animal electricity, was born in 1737 at Bologna. In his early youth he ſhewed a great propenſity to religious auſterities; but being diſſuaded from entering into an order of monks, whoſe convent he frequented, he directed his attention to the ſtudy of medicine. He purſued this ſtudy under able maſters, and gained their eſteem, eſpecially that of profeſſor Galeazzi, who received him into his houſe, and gave him his daughter in marriage. In the year 1762, after having ſuſtained an inaugural theſis, "De Oſſibus," he was appointed public lecturer in the univerſity of Bologna, a reader in anatomy to the inſtitute in that city. By the excellence of his method of teaching he obtained crowded audiences, and by his reſearches and experiments in phyſiology and comparative anatomy he eſtabliſhed a high reputation throughout the ſchools of Italy. A ſingular accident is ſaid to have given birth to the diſcovery which has immortalized his name. His wife, to whom he was moſt tenderly attached, being in a declining ſtate of health, uſed a ſoup made from frogs as a reſtorative: and ſome of theſe animals, ſkinned for the purpoſe, happening to lie on a table in Galvani's laboratory, on which was placed an electrical machine, one of the aſſiſtants in his experiments, by accident, brought the point of a ſcalpel near the crural nerves of a frog lying not far from the conductor. Inſtantly the muſcles of the limb, were agitated with ſtrong convulſions. The experiment was repeated, the fact aſcertained, and a long ſeries of new experiments, ingeniouſly varied, were put in execution, by which he inveſtigated the law of nature, of which accident had thus given him a glimpſe. His firſt publication on the ſubject was printed for the inſtitute at Bologna in 1791, and entitled, "Aloyſii Galvani de viribus Electricitatis in motu Muſculari Commentarius." This work immediately excited the attention of philoſophers both in Italy and other countries, and the experiments were repeated and extended. In the hands of the celebrated Volta the agent was increaſed in power to a great extent, and, directed by the genius of Mr. Davy, it has already led to moſt important diſcoveries in regard to the compoſition of many ſubſtances, heretofore deemed elementary, and bids fair to change the whole face of chemical ſcience.

In conjunction with his phyſiological inquiries, the duties of his profeſſorſhip, and his employment as a ſurgeon and accoucheur, in which practice he was very eminent, gave full occupation to the induſtry of Galvani. In addition to a number of curious obſervations on the urinary organs, and on the organ of hearing in birds, which were publiſhed in the Memoirs of the Inſtitute of Bologna, he drew up various memoirs on profeſſional topics, which have remained inedited. He regularly held learned converſations with a few literary friends, in which new works were read and commented upon. He was a man of moſt amiable character in private life, and poſſeſſed of great ſenſibility, inſomuch that the death of his wife, in 1790, threw him into a profound melancholy. His early impreſſions on the ſubject of religion remained unimpaired; he was always punctual in practiſing its minuteſt rites; and from this cauſe, no doubt, he ſteadily refuſed to take the civic oath exacted by the new conſtitution of the Ciſ-alpine republic, and was conſequently deprived of his poſts and dignities. In a ſtate of melancholy and poverty he retired to the houſe of his brother James, a man of very reſpectable character, and fell into an extreme debility. The republican governors, probably aſhamed of their conduct towards ſuch a man, paſſed a decree for his reſtoration to his profeſſional chair and its emoluments: but it was now too late. He expired on the 5th of November 1798. Gen. Biog.

GALVANIC BATTERY. See BATTERY.

GALVANISM. This valuable and intereſting branch of ſcience has been named after its illuſtrious diſcoverer, profeſſor Galvani, late of Bologna; and compriſes all thoſe electrical phenomena ariſing from the chemical agency of certain metals with different fluids.

When we view the numerous facts which have been added to the labours of Galvani, his diſcoveries form a very ſmall part of the great maſs. If, however, we recollect that the inveſtigation began with him, and was in a great degree promoted by his own perſeverance, we muſt ever conſider him as a principal in this extenſive field of reſearch.

Some have been inclined to give the greateſt merit to ſignior Volta, who was the diſcoverer of the means of multiplying the effects, which Galvani produced by a ſimple metallic communication; but ſurely Galvani has the greateſt claim, ſince Volta only improved upon what he had diſcovered.

The whole of the hiſtory which led Galvani to this diſcovery we conſider of little importance. Suffice it to ſay, that he by accident found that common electricity had the property of producing muſcular contractions in the limbs of animals a conſiderable time after death.

Of this he more clearly convinced himſelf by aſcertaining that from whatever ſource the electricity was drawn the effect was the ſame.

In one inſtance, however, he found that by the mere agency of a metallic ſubſtance, where he had no reaſon to ſuſpect the preſence of electricity, the limbs of a recently killed frog were convulſed. After making a number of experiments, he aſcertained that the convulſions were produced only when diſſimilar metals were employed.

The experiments of Galvani were repeated by many philoſophers,

loſophers, both on the continent and in this country. None, however, added any thing new to what Galvani had diſcovered, excepting the celebrated Volta.

We have not, perhaps, in the hiſtory of any ſcience, more abundant proof of the bad effects of too early entering into theoretical ſpeculations upon new diſcoveries, than are preſented in the hiſtory of Galvaniſm.

About 40 years prior to Galvani's diſcovery, a perſon of the name of Sultzer gave an account of the following fact. If a piece of lead and a ſimilar piece of ſilver be laid together, and the edges of both be brought in contact with the tongue, a taſte is perceived ſimilar to that of vitriol of iron, at the ſame time that the metals applied ſeparately produce no effect. The obſerver of this fact does not appear to have been ſurpriſed at the effect. At that time the doctrine of vibrations was employed to explain all natural phenomena. He therefore concluded that ſome peculiar vibrations took place from the contact of the metals, which produced the peculiar ſenſation on the tongue. All the world were ſatisfied with this explanation; and thus a prominent fact had ſlept in obſcurity from the time of Sultzer to the time of Galvani.

Fortunately, however, for the philoſophical world, the age in which Galvani made his diſcovery was not an age of conjecture and fancy; for the time had arrived when experiment was deemed the only teſt of truth.

It appears that Galvani, at the time of his diſcovery, was enthuſiaſtic in the application of electrical theory to animal economy; and when he found the metallic ſubſtances were capable of exciting muſcular motion, he was confirmed in the opinion, that the inherent electricity of the animal was tranſmitted from the nerves to the muſcles by the metals employed. Had this opinion been generally received, in all probability this ſubject would not have received much improvement.

About this time, however, ſignior Volta took up the ſubject, and philoſophy has to rejoice that his mode of theorizing, although not ſtrictly true, has contributed principally to its rapid advancement. He ſet out with the idea, contrary to Galvani, that the electricity in queſtion did not belong to the animal, but to the different metals employed. Galvani, therefore, was unlikely to produce any greater effect than what two pieces of metal could effect, becauſe he believed the electricity to be in the animal. Volta was led to the diſcovery of the battery by combining a number of pieces of metal together, becauſe he was perſuaded that the electricity was in the metals and fluids employed.

He repeated the experiments of Galvani, and found that when two pieces of metal of different kinds were placed in different parts of an animal at the ſame time that the metals were brought in contact, or were connected by a metallic arc, as often as the contact was made, convulſions were obſerved. He found that the greateſt effect was produced when the metals were zinc and ſilver. When ſeveral pairs of metals were employed, having pieces of moiſt cloth between them, the effect appeared to increaſe as the number of pairs.

This important diſcovery of accumulating the effects of this ſpecies of electricity was made by Volta in 1800, and hence has been denominated the Voltaic pile. The apparatus, as firſt made by Volta, conſiſted of a certain number of pairs of zinc and ſilver plates, ſeparated from each other by pieces of wet cloth. Hence the arrangement was as follows: zinc, ſilver, wet cloth; zinc, ſilver, wet cloth, and ſo on. The ſilver plates were chiefly ſilver coins, the plates of zinc and the pieces of cloth being of the ſame ſize. He found this pile much more powerful when the pieces of cloth were moiſtened with a ſolution of common ſalt inſtead of pure water. A pile conſiſting of forty pairs of plates he found to poſſeſs the power of giving a very ſmart ſhock, ſimilar to that of a ſmall electric jar; and that this effect took place as often as a communication was made between each end of the pile, and as long as the pieces of cloth remained moiſt.

An account of this diſcovery was communicated to the Royal Society, and publiſhed in the Philoſophical Tranſactions.

We do not hear of this celebrated philoſopher making any further diſcovery after the invention of the pile, and aſcertaining the nature and extent of its effects upon animals.

The firſt experiments made upon the pile in this country appear to have been made by Meſſrs. Nicholſon and Carliſle. After obſerving the effects then already aſcribed to the piles on bringing the wires from each end of the column in contact with a drop of water, they obſerved a diſengagement of bubbles of ſome elaſtic fluid.

On cloſer examination they found the gas to be hydrogen. They then took a glaſs tube, about half an inch in diameter, into each end of which a cork was inſerted, the tube being filled with water. Through each cork was introduced a braſs wire, ſo that the ends of the wires in the glaſs were about $1\frac{3}{4}$ of an inch. The pile employed conſiſted of 36 half crowns, and as many ſimilar pieces of zinc, and wet paſteboard. The zinc end of the pile was then connected with one of the wires in the tube, and the ſilver end with the other; ſo that the circuit formed by the pile and the wires was ſeparated by the water in the tube placed between them. A ſtream of bubbles was obſerved at the end of the wire, in the tube connected with the ſilver end of the pile. No gas was diſengaged from the oppoſite wire, but it ſpeedily became tarniſhed, firſt of an orange colour, and ultimately black. The tube was then reverſed, when it was obſerved that the wire, which in the firſt experiment became tarniſhed, gave out bubbles, while that which had before given out gas, in its turn became tarniſhed.

The emiſſion of gas from the wire connected with the ſilver end of the pile was conſtant and uniform, except when a metallic circuit was formed between the ends of the pile, during which no gas whatever appeared. It was obſerved that when this metallic conductor was removed, the appearance of the gas was not immediate, ſince there was an interval of about two ſeconds between removing the wire, and the appearance of bubbles. After the proceſs had continued two hours and a half, a bulk of gas was produced equal to two-thirds of a cubic inch. This gas was mixed with an equal bulk of common air, and exploded on the application of a lighted taper.

Theſe ingenious experimenters, ſuppoſing the phenomena in queſtion to ariſe from the decompoſition of the water, thought it ſurpriſing that the hydrogen ſhould make its appearance at a diſtance of $1\frac{3}{4}$ of an inch from the point where the oxygen was diſpoſed of.

They then made the experiment with a longer tube, but no appearance of gas was obſerved at the diſtance of thirty-ſix inches. When they introduced an infuſion of litmus inſtead of pure water, they obſerved that the fluid in the vicinity of the wire connected with the zinc end of the pile became red, and hence were led to ſuppoſe that an acid had been produced. The fluid at the other wire was not changed, but gas, as uſual, was evolved.

Mr. Nicholſon aſcertained that the zinc end of the pile was in the plus ſtate of electricity, and the oppoſite end in the minus ſtate.

They next varied the experiment by inſerting into the tube

tube of water wires of platina inſtead of braſs. Under this circumſtance, both the wires gave out gas, but neither of them were tarniſhed. There appeared to be a larger volume of gas from the ſilver end than from the zinc. The apparatus was ſo arranged that the gaſes were ſeparately collected. On examination, the gas from the ſilver end was found to be hydrogen, as before, and that from the zinc end oxygen. Their proportions were found to agree with the component parts of water.

The Galvanic energy, evinced in the decompoſition of bodies, was further proſecuted by Mr. Cruickſhank of Woolwich. He employed in his experiments a pile conſiſting of from 40 to 100 pairs of plates of ſilver and zinc about $1\frac{1}{2}$ inch ſquare.

He alſo provided a glaſs tube, into each end of which a cork was inſerted, one of which was cloſely cemented ſo as to be air-tight; through each of the corks a ſilver wire was paſſed, the ends in the tube being at a certain diſtance from each other. The tube, being filled with water, was placed perpendicularly in a cup containing water, with the uncemented cork downwards.

On the wires being connected with the ends of the pile, bubbles began to appear at the wire connected with the ſilver end of the pile. At the end of the other wire bubbles alſo appeared, and at the ſame time a white cloud, which became of a darker colour, and ultimately purple or black. The gas was collected and found to conſiſt of oxygen and hydrogen in the proportion of one to three. The wire from the zinc end of the pile was much corroded and even diſſolved, which fully accounted for the deficiency of oxygen in the gaſſeous form. Mr. Cruickſhank very truly conjectured, that the cloud which became black was the murat of ſilver, the muriatic acid having been derived from ſome muriatic ſalt in the water employed.

With a view to aſcertain how far his conjecture was right, he filled the tube with diſtilled water, containing an infuſion of litmus. The appearances, with reſpect to the evolution of gas, were ſimilar to the laſt experiment; but the fluid in the vicinity of the wire coming from the zinc end of the pile, became of a red colour, while the fluid about the other gradually loſt its purple tinge, and became of a deeper blue. In ſhort, an acid appeared to be produced about the former wire, and an alkali about the latter. An infuſion of Brazil wood underwent ſimilar changes to thoſe obſerved by an acid and an alkali. In all theſe experiments a quantity of ſilver was oxyded, and when water was employed, a portion was always diſſolved, ſome of which was precipitated at the wire from the ſilver end of the pile by the alkali which was produced.

This ingenious experimenter, knowing that hydrogen in its naſcent ſtate was capable of reducing moſt metallic oxyds, filled the tube with a ſolution of acetat of lead, and found that the hydrogen all diſappeared, being employed in the reduction of the metal. By this means he alſo obtained pure oxygen gas. The ſame was obſerved when ſolutions of nitrat of ſilver and ſulphat of copper were employed. When a ſolution of muriat of ammonia was employed in the tube, the ſilver became oxydated, the oxyd combined with the muriatic acid of the ſalt, and the liquor afterwards ſmelt ſtrongly of ammonia. In a ſimilar way the muriat of ſoda and nitrat of magneſia were decompoſed.

Mr. Cruickſhank repeated the above experiments, but inſtead of ſilver wires, he inſerted into the tube wires of gold. The proportion of oxygen gas was now much greater than with the ſilver wires, the gold wire not being ſuſceptible of oxydation in the proceſs.

His next attempt was to collect the gaſes ſeparately; this he effected by a tube about ten inches long, which was bent into the form of the letter V; the wires were paſſed through corks firmly cemented into the ends of the tube, coming near to the angular point. A ſmall hole was made in the angular point of the tube, by which it was filled with water. The tube was then inverted in a cup of water, and the connection made with the other ends of the wires and the pile. By this contrivance the hydrogen gas aſcended into one leg of the tube, and the oxygen into the other. He next filled the tube, firſt employed, inſtead of water, with muriat of lime; the rapidity of the proceſs was much increaſed. The gold wire on the zinc ſide became partly diſſolved, and the fluid in its vicinity aſſumed a yellow colour. When the tube was opened, a ſtrong ſmell of aqua regia was perceived. Similar phenomena were obſerved when muriat of ſoda was employed.

Having tried the effect of Galvaniſm upon acid ſolutions of metals, he was induced to try what effect was produced upon alkaline ſolutions, for this purpoſe he added an exceſs of ammonia to a ſolution of nitrat of ſilver. He found, as might be expected, that metallic ſilver was formed at the wire from the ſilver ſide, and a dark grey ſubſtance depoſited upon the oppoſite wire, which he afterwards found to be the fulminating ſilver of Berthollet. When an ammoniacal ſolution of copper was employed, the copper became reduced upon the wire from the ſilver ſide.

In addition to the ingenious experiments made by Mr. Cruickſhank, we are indebted to him for the diſcovery of what is called the Galvanic trough. This conſiſted of a wooden box, of a width and depth agreeable to the ſize of the plates, and of convenient length for handing about. The inſide was furniſhed with grooves, paſſing acroſs the ſide and bottom, for the reception of the plates, at ſuch a diſtance, that when the plates were cemented into the grooves, the trough was divided into a number of cells about $\frac{3}{8}$ths of an inch wide; each of theſe plates were compound, two plates, one of zinc, and the other of copper or ſilver, ſoldered together. The order in which they were placed was ſuch that all the zinc ſides of the plates faced one way, and the copper ſides the other. In fact the trough was the pile placed horizontally, the cells being for the reception of a fluid, to anſwer the purpoſe of pieces of wet cloth.

This apparatus was found ſo much more convenient in making the different experiments than the pile, that it was generally adopted in this country.

The trough conſtructed by Mr. Cruickſhank conſiſted of fifty plates each of zinc and ſilver, each plate being $2\frac{1}{4}$ inches ſquare. This trough was found very powerful in giving the ſhock. A ſmall piece of ſteel wire being employed to unite the end of the trough as ſoon as the end of the ſmall wire came in contact with a piece of metal connected with the other, a vivid ſpark was obſerved with ſlight ſcintillations: a ſmall piece of phoſphorus being placed at the end of the wire, on the contact being made, inſtantly inflamed.

When the contact was made with a ſlip of leaf gold, it was deflagrated with a bright flame, of a white colour, leaving a dark ſtain upon the metal touched by the gold leaf.

Batteries of much larger ſize were ſoon conſtructed by different philoſophers, by which it was found that all the metals, reduced into thin leaves, were deflagrated with brilliant, though differently coloured flames.

It was in this ſtage of progreſs of Galvaniſm, that ſome uncertainty exiſted reſpecting the preciſe nature of the fluid to which theſe ſurpriſing effects were attributed. Although it was generally ſuppoſed the effects were purely electrical, ſome were inclined to doubt the identity of the two fluids,

particu-

particularly ſo far as regarded the chemical effects of Galvaniſm. This matter, however, was finally ſet at reſt by a courſe of ingenious experiments made by Dr. Wollaſton.

He introduced into each of two glaſs tubes of very ſmall bore a piece of very fine gold wire. He then fuſed the glaſs at one end of each and drew it out, ſo that the glaſs compleatly enveloped the gold wire in that part. Each of theſe ends of the tube were ground off ſmooth and flat, ſo that the bare ends of the wire were preſented to the water. The ends of the tubes ſo prepared were introduced into water, and the oppoſite ends connected with an electric machine, the one with a negative conductor, the other with the poſitive conductor. The wire connected with the former gave out bubbles of hydrogen, while that connected with the latter afforded bubbles of oxygen gas. When theſe wires were immerſed in a metallic ſolution, the metal became reduced at the negative ſide. Indeed all the effects were produced by nitric acid, metal, ſulphuret, water, nitric acid, metal, and ſo on. He afterwards made a pile even without metal, by ſubſtituting charcoal in the latter arrangement inſtead of metal.

From the ſteady and perpetual action of the Galvanic battery, it was expected by phyſiologiſts that ſomething important would be effected by it as a medical agent. Theſe inquiries, however, were not attended with great ſucceſs, and in conſequence gave way to reſearches connected with the effects of Galvaniſm, as a chemical agent.

In the experiments of Cruickſhank, it may be remembered, that when the wires coming from each end of the battery terminated in a glaſs tube, ſtrong ſigns of acidity were obſerved in the vicinity of the wire from the zinc end, while the preſence of an alkali was detected around the oppoſite wire. The preſence of muriatic acid and an alkali had alſo been obſerved by other experimenters in the experiment where decompoſition of water took place. An account was publiſhed by a Mr. Peel of Cambridge in the Philoſophical Magazine, vol. xxi. p. 279; in which he aſſerts, that during the experiments in which water was decompoſed, a quantity of muriat of ſoda was formed. This experiment was repeated by many philoſophers according to Mr. Peel's deſcription, but without the production of any ſalt whatever. It was afterwards aſſerted, that no ſuch perſon as Mr. Peel could be found, and the experiment was believed to be a groſs impoſition.

In the ſame number of the Philoſophical Magazine M. Pacchioni is ſaid to have produced free oxymuriatic acid from pure diſtilled water, by the Galvanic proceſs, in ſuch quantity as to diſſolve the gold wire which it ſurrounded.

At the time theſe facts were announced, the author of this article took great pains to inveſtigate this point. After repeated experiments made in the manner deſcribed by Peel and Pacchioni, he did not in any inſtance diſcover the preſence of muriatic acid, when pure water was employed. He then tried the experiment as follows: he took a glaſs tube about a quarter of an inch in diameter, and $2\frac{1}{2}$ inches long. Upon one end was tied a piece of thin bladder, ſo as to render the tube capable of holding water. A cork was looſely introduced into the other end of the tube, through which was paſſed a platina wire, reaching within about a quarter of an inch of the bladder. The tube was then placed in a ſmall platina cup, and connected with the zinc end of the battery, while the platina wire was connected with the other end, the tube being filled with diſtilled rain water. In a very ſhort time ſtrong ſigns of acidity were obſerved in the cup, which proved to be the muriatic, and ſoda was found in the tube in ſuch quantity, that when the two portions were mixed together they became neutral.

This experiment was repeated with the ſame apparatus, even without changing the bladder more than twenty times, producing in the ſame time about the ſame quantity of acid; an alkali which had been produced by the Galvanic apparatus, this ingenious experimentaliſt produced by the common electric machine.

Another very valuable diſcovery was made by Dr. Wollaſton, by which we are enabled to aſcertain the relative Galvanic power produced by the contact of different metals in different fluids. He took a piece of zinc and a piece of ſilver, and immerſed each extremity into a veſſel containing very dilute muriatic or ſulphuric acid. The zinc was oxydated and diſſolved in the uſual manner, affording much hydrogen gas, but no action took place upon ſilver. When, however, the two extremities, out of the fluid, were brought in contact, the ſilver began to give out bubbles of hydrogen, which continued ſo long as the connection was formed, and as inſtantly ceaſed when the ends were ſeparated.

When the pieces of metal were ſimilarly placed in a ſolution of copper, the ſilver did not afford hydrogen, but the copper was precipitated in the metallic form upon the ſilver.

The apparent facility with which this ſingle combination produced the chemical effects of Galvaniſm, induced Dr. Wollaſton to try how ſmall a quantity of electricity was capable of effecting the decompoſition of water. For this purpoſe he lined the inſide of a very ſmall glaſs tube with a ſolution of gold in aqua regia, and then by heat expelled the acid, leaving a very fine film of metallic gold upon the inner ſurface. The tube being melted, converted the thin film into a very fine thread of gold. When the ends of this fine thread were expoſed to the water in the uſual manner, it was found that the mere electrical current, excited by the machine, in its paſſage from the negative to the poſitive conductor, effected the decompoſition of water. With a view to aſcertain whether the other chemical effects, ſuch as had been effected by the pile, could be produced by the electric machine, he took a card, coloured with a ſtrong infuſion of litmus, and touched it with two gold points connected with each ſide of the machine, the points being about an inch from each other; the card at the ſame time being nearly dry. Around the point connected with the poſitive ſide, the litmus became red. When, however, the points were reverſed, the negative points being applied to the reddened part, the blue colour became reſtored.

Some valuable experiments were about the ſame time made by Mr. Davy of the Royal Inſtitution, with a view to aſcertain whether two diſſimilar ſubſtances were eſſential to the production of this ſpecies of electricity, which, according to the opinion of Volta, had hitherto been ſuppoſed. This ingenious chemiſt found that a pile could be conſtructed with one metal only, provided one ſide of the plate were in contact with a fluid of deoxydating quality: the other with an oxydating liquid, and the two liquids ſeparated by liquid of a neutral nature. This he effected by the following arrangement: metal, ſulphuret of potaſh, water.

All circumſtances conſidered, ſo ſtrongly favoured the idea of the formation of the acid and the alkali, that the author of this article did not heſitate to publiſh the fact. In a converſation with an eminent chemiſt, it was hinted that the acid and alkali might be derived from the animal ſubſtance ſeparating the two fluid portions, and that the alkali might even be derived from the glaſs tube.

In order to do away the objections of the animal ſubſtance and the glaſs tube, he procured a tube about three inches long and half an inch in diameter, made of tobacco-pipe clay. This tube being filled with diſtilled water, and placed

placed in a platina cup connected with one end of the battery, a platina wire was placed in the tube, and connected with the other end. The action took place very rapidly, and the acid and alkali formed as uſual. An account of this experiment was publiſhed in Nicholſon's Journal for Auguſt 1806.

Theſe experiments are not noticed by any philoſopher till they were atteſted by Mr. Davy, in the very valuable paper entitled "Some Chemical Agencies of Electricity," which was read by him to the Royal Society, Nov. 20, 1806, and publiſhed in their Tranſactions for 1807, part i. vol. 17. Supplement.

Mr. Davy, after alluding to the experiments of Peel and Pacchioni, mentions the experiment, above deſcribed, with the clay tube. He does not object to the reſults of the experiment, but thinks the concluſions are objectional. Firſt, becauſe the alkali was only teſted by turmeric paper, which would have aſſumed the ſame appearance with lime; and, ſecondly, that the clay might even contain potaſh. The argument of Mr. Davy may very ſufficiently account for the alkaline appearances, but he does not even hint how the muriatic acid was formed.

Mr. Davy procured two agate cups, each having the capacity of about a quarter of a cubic inch. Theſe cups were boiled for ſome hours in diſtilled water. The cups were then filled with diſtilled water, and connected together with a piece of very white amianthus, previouſly moiſtened. A piece of platina wire was introduced into each of the cups, and connected with a battery conſiſting of 150 pairs of plates four inches ſquare, and charged with a ſolution of alum. After the proceſs had gone on 48 hours, the water in the cups was examined, when it was found that the water of one of them contained ſoda, and the other muriatic acid.

Mr. Davy repeated the experiment in the ſame cups ſeveral times, and found that acid and alkali diminiſhed in every experiment. By continuing the proceſs for three days, he found very little alkali; but in the other tube was an abundance of acid, which proved to be the nitric acid.

After theſe reſults, he concluded that the agate tubes contained ſome ſubſtance capable of affording the acid and alkali. But independent of the tubes, he ſuppoſed that the alkali was derived from ſome other ſource, ſince it continued to appear to the laſt in quantities ſufficiently diſtinguiſhable after every precaution had been obſerved.

Mr. Davy now began to ſuſpect the purity of the water, although it had been diſtilled. It appeared pure by the teſts of nitrat of ſilver and muriat of barytes; but as potaſh and ſoda are capable of riſing by rapid diſtillation, and as the water was from the New River, which contains animal and vegetable matter, he thought that potaſh or ſoda might be furniſhed by the neutral ſalts they contained.

To do away the objection of the agate tubes, he employed two cones of pure gold, each holding about 25 grains of water. The cones being filled with diſtilled water, and connected with the ſame piece of amianthus, which was employed for the agate tubes, they were made to communicate with a battery of 100 pairs of copper and zinc plates of ſix inches ſquare. In ten minutes the water in the negative cone, or that connected with the copper ſide of the battery, gave ſigns of an alkali. In 14 hours the acid produced in the other cone was very conſiderable, but the alkali did not appear greater than in the firſt trial. The alkali was a fixed one, and the acid appeared to be nitrous. This experiment was repeated, and carried on for three days, but the alkali did not increaſe.

Mr. Davy was now of opinion, that the water contained ſome ſubſtance capable of furniſhing the ſmall and limited portion of alkali in this experiment. And to be more ſatisfied of this, he evaporated a quart of the diſtilled water at the temperature of 140° Fahrenheit in a ſilver ſtill. The ſolid matter was equal to $\frac{7}{10}$ths of a grain. He did not enter into a particular analyſis of this reſiduum, but believed it to conſiſt of nitrate of ſoda and nitrate of lead, ſuppoſing the latter to have been derived from the worm of the common ſtill. On filling the gold cones with the water uſed in the firſt experiments, the maximum of effect was ſoon produced; but upon introducing ſome of the reſidual matter obtained from the water, in leſs than two minutes the effects were evident, and in five minutes it changed turmeric paper to a deep brown.

By ſubmitting the water to a ſecond ſlow diſtillation it was obtained ſo pure, that when acted upon in the cones by the battery for two hours, only ſlight ſigns of the alkali were evinced, which after heating ſtrongly for a few minutes diſappeared; a proof that the alkali was ammonia. Hence Mr. Davy concludes that the fixed alkali is not formed in the experiment, but afforded by the water or other ſubſtance employed.

This indefatigable experimenter made a ſeries of experiments, in which he employed cups of different ſubſtances, with the pure water. Tubes of wax afforded potaſh, ſoda on one ſide, and ſulphuric and muriatic acids on the other. With tubes of reſin, the alkaline matter was principally potaſh. Carrara marble afforded lime and a fixed alkali, but the latter decreaſed in every experiment, till nothing but lime was produced. Mr. Davy uſed many other mineral ſubſtances, from moſt of which he obtained more or leſs fixed alkali.

He had before ſuppoſed, that when glaſs veſſels were employed, the fixed alkali was derived from the glaſs. To ſtrengthen this conjecture, he arranged the apparatus with the gold cones, as before, with pure water, and after a quarter of an hour no change was produced. On introducing into the cones a bit of glaſs, however, the fluid in the negative cone became highly ſenſible to turmeric paper. Mr. Davy here obſerves, that he had in every experiment a portion of nitric acid formed, and in quantity proportionate to the length of time the proceſs was continued. It appears alſo that ammonia was produced at the ſame time, but its limit was ſoon attained.

Suppoſing theſe reſults to ariſe from the nitrogen of the common air exiſting in the water, he repeated the experiments under the receiver of an air pump, exhauſted to $\frac{1}{64}$ of an atmoſphere. In 18 hours no ſigns of alkali were obſerved, but the acid in the oppoſite cone gave a perceptible red tinge to litmus paper. On repeating the experiment in an atmoſphere of hydrogen gas, he did not perceive any ſigns of acid or alkali. Hence he concluded, that the nitrous acid and the ammonia had owed their formation to the water, and the nitrogen of the atmoſpheric air.

The numerous important facts brought to light by the above inveſtigation induced Mr. Davy to extend his enquiries, particularly ſo far as related to the transference of the elements of compound bodies by the Galvanic proceſs.

He took two cups of compact ſulphat of lime, into which he introduced pure water, and connected them, as in the above experiments, with amianthus previouſly moiſtened: into each cup was introduced a platina wire connected with a battery of 100 pairs of ſix-inch plates. In five minutes the liquid in the poſitive cup, or that connected with the zinc end, became acidulous, and the other contained lime. Two ſimilar cups of ſulphat of ſtrontian afforded a ſimilar reſult, the earth being found pure in the negative cup, and

the acid in the poſitive. In a ſimilar manner veſſels of fluat of lime afforded lime and fluoric acid.

On trying the ſame experiment with ſulphat of barytes, he found that the acid and baſe were more obſtinate in giving way to the electrical power. By uſing a greater power, however, in four days he obtained portions of the earth and acid.

He then made a number of experiments with different mineral ſubſtances, which by analyſis afforded alkali or acid. His firſt experiment was upon the fine grained baſalt, from Portruſh, which by analyſis afforded ſoda, muriatic acid, and lime. Two cups were expoſed as in the laſt experiment. In ten hours oxy-muriatic was found in the poſitive cup, and ſoda and lime in the other. The mineral called lapidolite gave potaſh in this way; and a piece of vitreous lava from Ætna gave lime, potaſh, and ſoda.

From the reſults produced upon inſoluble bodies, it was natural to expect that ſimilar decompoſitions and transfers would take place with the ſoluble ſaline compounds. The ſubſtances to be operated upon were diſſolved in water, and introduced into the two agate tubes mentioned in the firſt experiments, and the connection formed between them by moiſtened amianthus. The baſe of the ſalt was transferred to the negative cup, and the acid to the poſitive. The ſalts which Mr. Davy employed, and which underwent this change, were ſulphats of potaſh, ſoda, and ammonia, nitrats of potaſh and barytes, phoſphat of ſoda, the ſuccinat, oxalat, and benzoat of ammonia, and a ſolution of alum.

The muriats, when ſubjected to this proceſs, afford oxymuriatic acid. This was occaſioned by the oxygen of the water, which was decompoſed at the ſame time.

When a ſolution of a number of compatible ſalts was expoſed in the agate cups, all their baſes were transferred together to one ſide, and the acids collectively to the other, without any regard to their order of affinity.

The decompoſition appears to have been more compleat in the metallic ſalts, ſince the oxyd of the metal is alſo decompoſed; the oxygen and the acid arranging themſelves around the poſitive wire, and the metal in cryſtals adhering to the negative wire. Mr. Davy aſcertained, that in theſe experiments the decompoſition was capable of being compleat. In an experiment made with ſulphat of potaſh no acid was found in the alkaline cup, nor any trace of alkali in the acid one.

Here Mr. Davy alludes to an experiment made by Mr. Gautherot, Annales de Chimie, vol. xxxix. page 203, in which he obſerved that the oxyd of zinc was transferred to the negative wire. Another fact is alſo mentioned by M. M. Hiſinger and Berzelius, in the ſame, vol. li. page 171. They had in one leg of a ſyphon a ſolution of muriat of zinc, and in the other diſtilled water, the former leg being connected with the poſitive ſide of the battery, and the latter with the negative. The diſtilled water, after a certain time, they found to contain lime.

Mr. Davy took a cup of agate and another of ſulphat of lime, into which he introduced diſtilled water, and connected them as in the former experiments, the agate cup being made negative. In four hours the diſtilled water in the agate cup contained lime, and the other had an exceſs of ſulphuric acid. The order was now reverſed, when it was found, in a ſimilar length of time, that the agate cup contained ſulphuric acid, and the other an exceſs of lime.

In order to aſcertain whether it was eſſential that the wires from the battery ſhould be in abſolute contact with the ſaline ſolution, he filled two glaſs tubes with diſtilled water, and placed between a third veſſel, containing a ſolution of muriat of ſoda, the ſurface of the latter fluid being lower than thoſe of the water in the tubes. The wires were brought into the tubes containing pure water, and in ſixteen hours the poſitive tube became ſtrongly acid, and the other very alkaline, with muriatic acid and ſoda.

Finding the acid and alkali to be really tranſmitted from the middle veſſel, through the pieces of amianthus, to the wires in the tubes, he filled one of the tubes with a ſolution of ſulphat of potaſh, and the other with diſtilled water: the middle veſſel contained diſtilled water tinged with litmus. Some ſlips of moiſtened litmus paper were placed above and below the amianthus in the circuit. The connection being formed, making the ſaline tube negative, the redneſs began to appear on the poſitive ſide of the arrangement, and gradually diffuſed itſelf to the middl of the intermediate veſſel; but no change took place on the negative ſide, although the acid had been all the while paſſing from the negative to the poſitive ſide. The order was now reverſed, making the ſaline ſolution to occupy the poſitive ſide; but inſtead of litmus, turmeric was employed in the intermediate veſſel. The alkali exhibited the ſame myſterious appearance in its paſſage from the poſitive to the negative ſide. The turmeric became brown on the negative ſide only, while the poſitive ſide of the intermediate veſſel underwent no change.

In another experiment two glaſs tubes were filled with a ſolution of muriat of ſoda, and the intermediate veſſel with ſulphat of ſilver. Turmeric paper was placed on the poſitive ſide, and that of litmus on the negative: as ſoon as a communication was formed, ſoda began to appear in the negative tube, and oxymuriatic acid in the poſitive tube. In the intermediate veſſel the muriatic acid marked its effects on the poſitive ſide by a denſe precipitate, and the ſoda was diſtinguiſhed on the other ſide by producing a lighter precipitate.

In the firſt of the two laſt experiments, it appears that the acid paſſed through the litmus, and the alkali through the turmeric, without producing any viſible effect upon them; and in the ſecond the muriatic acid had paſſed through ſulphat of ſilver without producing any precipitate, which tends to prove that the power by which the transfer is effected exceeds the chemical affinity of the bodies, which ſhould on this occaſion have been exerted. Several ſtriking experiments were made to clear up theſe apparent anomalies. Into one of the tubes uſed in the laſt experiment was put a ſolution of ſulphat of pot-aſh, into the other pure water, and into the intermediate veſſel a weak ſolution of ammonia. The ſaline ſolution being placed on the negative ſide, and the connection formed, the acid ſoon became viſible in the poſitive tube, ſo that it appears the power of transfer was greater than the affinity of ammonia for ſulphuric acid. This experiment was varied by uſing ſtrong and even ſaturated ſolutions of potaſh and lime with ſimilar reſults. In other experiments alkalies and earths were tranſmitted through acid ſolutions in the intermediate veſſel. It does not appear, however, that this power is adequate to the force of combination in all inſtances. Mr. Davy found that barytes did not paſs through ſulphuric acid without producing ſome ſulphat of barytes, and the ſame took place when the acid was attempted to be paſſed through a ſolution of barytes; ſimilar effects took place with ſtrontian and ſulphuric acid.

It was obſerved that the metallic oxyds were transferred with more difficulty than the alkalies and earths.

In an experiment in which the green ſulphat of iron was placed in the poſitive tube, pure water in the negative, and a ſolution of muriatic acid intermediate, in ten hours the green oxyd of iron began to appear upon the connecting

amianthus, and in three days it was in the negative tube. Similar refults were obferved with folutions of copper, lead, and tin.

When Mr. Davy made various animal and vegetable fubftances the connecting media inftead of amianthus, he found that the elements of the faline bodies which they contained were transferred. Thus he found that a leaf-ftalk of the polyanthus afforded nitric acid in the pofitive tube, and foda in the negative; and a piece of mufcular flefh afforded muriatic acid and foda.

The refult of thefe experiments appears to fhew, that the decompofition of bodies employed arifes from their different elements being attracted to the wires or other metallic fubftances connected with the ends of the Galvanic battery. When faline bodies are decompofed, the acid is attracted to the pofitive wire, and the bafe to the negative. If acids or other oxyds be fubjected to the fame procefs, the oxygen is attracted to the pofitive fide of the battery, and the inflammable bafe to the negative.

Mr. Davy fucceeded in producing fimilar refults of tranfference by common electricity. In the electrical current the fame arrangements were obferved with refpect to the transference. The acids and oxygen wire attracted that connected with the conductor, and which is pofitive; while the inflammable bafes and the bafes of falts were attracted to the fide connected with the negative conductor.

It had already been difcovered by Bennet and Volta that when certain bodies were brought in contact, a difturbance of electricity took place, by one of the bodies giving fome of its electricity to the other, and thus rendering one of them redundant or pofitive, and the other deficient or negative. Bennet found that when two flat polifhed plates, one of zinc, and the other of copper, were brought in contact face to face, the zinc received a portion of electricity from the copper. The plates were provided with infulating handles, and when they were feparated as quick as poffible, the relative ftates of electricity acquired by contact were rendered apparent by the fenfible gold leaf electrometer, invented by the fame ingenious philofopher.

It was afterwards difcovered by Volta that the difturbance of electricity took place from the contact of different fluids with metals, and it was on this principle that he endeavoured to explain the energy of the pile which he invented, and the effects produced in the experiments of Galvani.

Mr. Davy, with much ingenuity and great induftry, has refumed this enquiry, by obferving the electrical changes arifing from the contact of many different bodies.

He found that when an alkali was in contact with a metal, the latter gave fome of its electricity to the former. But an acid in a fimilar fituation gave its electricity to the metal. In the firft inftance the metal became negative, and the alkali pofitive; but in the latter the metal was pofitive, and the acid negative. It was on this principle that Mr. Davy conftructed a pile with one metal only, by placing an alkali, or what is better, a fulphuret of an alkali on one fide of the plate, an acid on the other fide, and water between each ftratum of alkaliand acid. By this means one fide of the plate was negative, and the other fide pofitive, fimilar to a compound plate of different metals.

Mi Davy made an attempt to eftablifh the relative quantities of electricity produced by the contact; but he did not fucceed with any other bodies than fuch as were perfectly dry. Thofe, however, which he did make were very conclufive, and tended much to fubftantiate the theory he had projected.

The folid and dry acids, either in powder or in cryftals, when brought into contact with metals, become themfelves negative, by giving their electricity to the metal, which, in confequence, become pofitive: fuch of the earths, and fuch of the alkalies as could be obtained dry, were tried upon metal. Lime, ftrontian, magnefia, and foda, by contact with metal, became pofitive, and the metal negative: fulphur, by contact with metal, becomes pofitive, and the metal the contrary. Mr. Davy found that fulphurated hydrogen became pofitive, and that the oxymuriatic acid became more negative than the common muriatic acid; and hence infers, that the contact of oxygen and hydrogen muft render the hydrogen pofitive, and the oxygen negative.

It was fair to conclude, that when bodies undergo different changes, with refpect to the fame body, they muft produce fome effect on each other. He found dry oxalic acid become negative with lime, which it rendered pofitive: the fame muft neceffarily follow between the acids and alkalies.

We may infer from this theory, that any two bodies are oppofed to each other in their electrical energies, in proportion as one becomes negative and the other pofitive, when they are brought in contact; and that, if we are to reafon from the common phenomena of electrical attraction and repulfion, we may expect that thofe bodies, which produce the greateft change upon each other, will have the ftrongeft attraction for each other. If the bodies, by contact, produce no change, we may infer that they will have no attraction for each other; but that if the pofitive or negative parts of two bodies, by contact, be prefented to one in the fame ftate, they muft abfolutely repel each other. All this has been fhewn to be the cafe in the experiments of decompofition of transfer.

Mr. Davy fuppofes, with much plaufibility, that the relative ftates of the electricity of bodies may be the caufe of chemical affinity, and of compofition and decompofition. It appears that bodies which have a ftrong affinity for oxygen, are, in their electrical ftates, ftrongly oppofed to that body. It alfo happens that acids, which combine with earths, alkalies, and metallic oxyds, are in a contrary ftate to the latter bodies. Another ftrong proof of the truth of this doctrine is, that the chemical affinity of bodies is altered by altering their electrical ftates. Thus, platina precipitates copper from its folutions when the platina is rendered negative; becaufe the copper in that fituation becomes more negative, and, in confequence, has a lefs affinity for oxygen. If, in the Galvanic circuit, zinc be made negative, it does not combine with oxygen, even if an acid be prefent. On the contrary, filver, being in a fituation where it becomes pofitive, acquires the power of decompofing water.

From thefe facts, and their conclufions, Mr. Davy has pointed out a path, which has already led to very important difcoveries. The elements of every compound, it is fair to conclude, are in different ftates of electricity, fo long as they exift in combination. If, therefore, by the artificial application of electrified furfaces, the elements of the compound are more ftrongly and truly attracted by fuch furfaces than they attract each other, a decompofition of the body muft be effected. And fince this artificial power can be accumulated to any extent, we may, with great confidence, expect that the ultimate elements of bodies may fome time be known.

Mr. Davy did not lofe much time in applying the principles he had already laid down. His firft experiment was upon potafh, a fubftance long fufpected by many chemifts to be a compound. His firft trial was upon a folution of alkali, but without fuccefs: he then tried it in a ftate of igneous fufion. The potafh was fufed in a platina fpoon, and was connected with one fide of a powerful battery, while a pla-

tina wire was made to touch the ignited alkali. A violent action took place; a brilliant light was obſerved on the negative ſide, as if ſome combuſtible matter were produced, and burned as it was evolved; when the ſpoon was negative, acriform globules were ſeen to riſe to the ſurface, and inflame on contact with air. He then made uſe of potaſh, ſlightly moiſtened by expoſure to the air: the potaſh was placed upon a plate of platina connected with the negative ſide of the battery, and a platina wire from the other end of the battery was brought in contact with the upper ſurface of the potaſh: a violent effervеſcence took place about the wire at the upper ſurface; no gas appeared on the under ſurface; but ſmall globules, having high metallic luſtre, and the general appearance of quickſilver, began to appear. Some of theſe globules burnt in the air with exploſion, and bright flame; others remained, becoming tarniſhed, and ultimately covered with a white film. Theſe metallic globules proved to be the ſubſtance for which Mr. Davy was in ſearch, and which appears to be the baſe of the alkali; ſo that it appears potaſh conſiſts of oxygen, united to a peculiar inflammable baſe. This decompoſition was, therefore, effected in conſequence of the oxygen of the alkali being attracted to the poſitive wire, and the inflammable baſe to the negative ſide. (See POTASH and ALKALI, and Phil. Tranſ. for 1808, part i. page 1.) By a ſimilar proceſs, Mr. Davy decompoſed ſoda, ammonia, and ſeveral of the earths; reſolving them, into oxygen and peculiar inflammable baſes.

An extenſive field is here opened for chemical reſearch, too vaſt for human conception, by the introduction of this powerful agent. More diſcoveries have been made in one year, than, perhaps, any one century can boaſt.

Having given an hiſtorical account of the moſt prominent facts of Galvaniſm, chiefly drawn from the detailed eſſays of the diſcoverers, we ſhall now proceed to the inveſtigation of the beſt means of exciting Galvanic energy, and the conſtruction of Galvanic apparatus. This part, however, we ſhall preface, with detailing ſome preliminary experiments, calculated to throw light upon the principles of this intricate ſubject, as well as to point out the beſt means of examining thoſe bodies fitted for the production of Galvaniſm. Bennet was the firſt who diſcovered that a certain number of bodies, when brought into contact, cauſed a diſturbance in their latent electricities: for inſtance, if a plate of copper be brought in contact with a plate of zinc, a portion of electricity is tranſmitted from the copper to the zinc, rendering the latter poſitive and the former negative. If the plates have inſulated handles, they may be ſeparated, and their reſpective ſtates may be ſhewn by Bennet's electrometer. When it was diſcovered that ſilver and zinc, or copper and zinc, were the beſt exciters of Galvaniſm, Volta, the diſcoverer of the pile, took advantage of the above fact to explain the phenomena. In the arrangement of the pile, which conſiſted of a certain number of pairs of plates of ſilver and zinc, with plates of wet cloths interpoſed between them, he conſiders the electricity generated by the contact as conſtituting the whole of the energy of this apparatus, the fluid of the wet cloths being a mere conducting medium from one pair of plates to another. Volta, however, himſelf acknowledges, that when he made uſe of water as the connecting medium, he had the ſame quantity of electricity indicated by the electrometer, as when the interpoſed fluid contained common ſalt, although the ſhock, in the firſt inſtance, was ſcarcely perceptible, while, in the latter, it was very ſevere.

Mr. De Luc has lately publiſhed an account in Nicholſon's Journal, which is to be continued, in which he has proved that the quantity of electricity indicated by the electrometer formed almoſt an imperceptible part of the Galvanic effect. Mr. Davy, in his account of the chemical agencies of electricity, already given, has endeavoured to account for the Galvanic effect on the principle of contact, without allowing any of the effect to the chemical actions of the ſubſtances employed. He conſiders the firſt effect to be produced by the contact of the diſſimilar metals, the zinc acquiring exceſs, and the copper becoming deficient. The elements of the water employed, he ſuppoſes, are in the ſame unequal ſtate, by being in combination; the oxygen being deficient or negative, and the hydrogen redundant or poſitive If a neutral ſalt be employed he alſo ſuppoſes that the acid and alkali are differently diſpoſed in their electrical tendencies by the former being negative, and the latter poſitive. Accordingly, therefore, in ſuch an arrangement, there would be the united electrical energy of the acid, of the ſalt, the oxygen of the water, and the copper plate, all of which are negative. Theſe would be oppoſed to the poſitive powers of the baſe of the ſalt, the hydrogen of the water, and the zinc plate. He ſuppoſes that during the action of a battery conſiſting of the above arrangement, the chemical action, ſo far from being the cauſe of the electrical energy, may be conſidered as the means of reſtoring the equilibrium between the bodies in different ſtates. The oxygen deſerts the hydrogen to combine with the zinc, forming oxyd of zinc, thus deſtroying the negative ſtate of a quantity of oxygen, and the poſitive ſtate of a quantity of zinc. The hydrogen repairs to the copper, which is in a contrary ſtate to itſelf. This contact leſſens the negative ſtate of the former, and the poſitive ſtate of the latter. In this ſtate of the proceſs the baſe of the ſalt and the oxyd of zinc are attracted to the copper ſurface, while the acid of the ſalt is attracted to the zinc plate; the former tending to annihilate the negative ſtate of the copper, and the latter the poſitive ſtate of the zinc plate.

If an acid be preſent in the fluid inſtead of a ſalt, which is capable of decompoſition, its elements are in contrary ſtates, and have an effect ſimilar to the water; but if the acid is not decompoſed, it can only contribute to the proceſs by diſſolving the zinc. In the electrical experiments of Mr. Davy, he has ſhewn that acids and oxygen become negative by being brought in contact with alkalies, earths, and inflammable matter, in the ſame way that certain metals alter their ſtates. In the experiments of Bennet and Volta we are diſpoſed to place the greateſt confidence. At the ſame time, however, we cannot believe that ſo ſmall a quantity of electricity can be capable of producing the powerful effects produced by Galvaniſm. We ſhall detail ſome experiments which will prove that the Galvanic proceſs depends in a great meaſure upon the chemical agents employed, and that in no inſtance is Galvaniſm produced without water. A metallic ſurface is capable of oxydation, and another metallic ſurface is kept free from oxydation, at the ſame time when the two metallic ſurfaces are unconnected. The electricity produced by the contact of bodies appears to be quite diſtinct from that produced by the chemical proceſs, and may be aſcertained by the electrometer. In a Galvanic ſeries, compoſed of fifty pairs of plates of zinc and copper, with a fluid medium of pure water, the electricity, as meaſured by the electrometer, will be juſt the ſame as if a quantity of muriatic acid were added to the water. Yet in the firſt inſtance no perceptible Galvanic effect will be perceived, while in the latter a very ſevere ſhock may be felt.

According to Mr. Davy's doctrine the electrical energies are the ſame in both inſtances, ſince the acid is not decompoſed, and of courſe cannot contribute to the effect. If it therefore does no more than diſſolve the oxyd of zinc, it can-

only

only be ſaid to keep up the original energy, and therefore the firſt effect of both muſt be the ſame, which is contrary to the fact. Agreeable to this hypotheſis, a ſolution of a neutral ſalt ought to produce the greateſt poſſible Galvanic effect from the additional agency of the oppoſite electrical ſtates of the acid and alkali. Mr. Davy aſſerts that in the firſt inſtance the effect is greater, but that in a little time the alkali gets to the copper plate, and tends to deſtroy its negative ſtate, and in conſequence the energy becomes much weakened or deſtroyed. As a proof of this, he obſerves, that if the trough be ſhaken, ſo as to mix the different ſubſtances in the cells, the power becomes much revived. Several aſſertions here are not ſupported by fact. In the firſt place no ſaline ſolution, even in the firſt beginning, produces ſo great an effect as a free acid, diluted with water, particularly the nitric acid.

Mr. Davy would account for the great effect of the nitric acid from the acid undergoing decompoſition. From ſimilar reaſonings nitrat of potaſh ſhould produce the greateſt effect poſſible, becauſe both the ſalt and the acid are decompoſed. This, however, does not agree with experience, ſince muriat of ſoda produces a greater effect than nitrat of potaſh, although the latter, conſiſtent with Mr. Davy's hypotheſis, ſhould produce a greater effect than nitric acid, by the additional electrical power of the acid and the alkali.

With reſpect to the permanence of the effect, it will be found in practice that acids which produce the greateſt effect in the firſt inſtance are the leaſt permanent, and that ſaline ſolutions, which act upon zinc very ſlowly, are found to be more permanent. Thoſe ſalts will be found moſt efficacious which form triple ſalts with zinc. Hence the reaſon why muriat of ſoda acts more powerfully than nitrat of potaſh, and why muriat of ammonia is ſtill more energetic than muriat of ſoda, ſince it oxydates, and combines with metals with very great facility. There are other facts which militate ſtrongly againſt Mr. Davy's theory: the free alkalies are found to have a greater Galvanic effect than the neutral ſalts. A ſolution of cauſtic of potaſh is much more powerful than any ſalts formed with that alkali. This may be accounted for from the facility with which alkalies diſſolve moſt oxyds of metals. Independent of the proofs already brought forward, we ſhall introduce ſome experiments which cannot fail to demonſtrate that the phenomena of Galvaniſm do not depend upon the ſlight electric effects produced by contact, but upon the chemical action of the bodies employed. Mr. Davy, in the paper to which we have before alluded, obſerves, that if electricity were produced during chemical changes, it ought to be appreciated by the electrometer; but till we are better acquainted with the connection between electricity and caloric, the latter of which is always diſturbed during chemical change, nothing concluſive can be drawn from ſuch argument. Mr. Davy mentions another experiment to prove that the Galvanic effect is not the reſult of the chemical effect. He ſtates that in the Galvanic combination of zinc, copper, and nitric acid, the zinc is poſitive. But on a combination of zinc, nitric acid, and water, the ſide of the zinc next the acid is negative. If, he obſerves, the Galvanic effect was dependent on the chemical action, the zinc would be poſitive in both inſtances. That the zinc in contact with the nitric acid is negative, Mr. Davy's own experiments and reaſoning contradict. The very contact of the acid, by his own hypotheſis, ought to make the zinc poſitive, which would alſo tend to increaſe its affinity for oxygen. Perhaps in all caſes in which water is decompoſed by the agency of a metal and an acid, the advantage of the preſence of the acid may in this way be accounted for.

Galvanic Combinations.—No ſubſtance can poſſibly enter into any Galvanic combination except it be a good conductor of electricity. The moſt common and ſimple Galvanic combination conſiſts of two ſurfaces of diſſimilar metals and a fluid containing oxygen placed between them. One of the metals ſhould be ſuſceptible of oxydation by the fluid, and the other leſs ſuſceptible of oxydation by the fluid. A communication made between the two metallic ſurfaces, either by bringing the metals together, or by connecting them by a metallic ſubſtance, will ſhew the effect of the combination by ſuch teſts as will hereafter be mentioned. A Galvanic combination, as Mr. Davy has ſhewn, may be formed of one metal only, by its being ſo ſituated that one part of it may undergo oxydation in a greater degree than the other. This Mr. Davy effected by placing dilute nitrous acid on one ſide of the metal and ſulphuret of potaſh on the other, having a ſtratum of water between the fluids. Well-burnt charcoal and plumbago are found to have the ſame effect with metals in Galvanic combinations. The moſt ſenſible teſt of any Galvanic combination is the muſcles of a recently killed frog: if the limbs are placed in the circuit, which connects the two metallic ſurfaces, at the ſame time the metals touch one another, the muſcles are violently convulſed. If the metals be in any degree diſſimilar between which the limbs are placed, at the ſame time that the part is moiſtened with water, convulſions will be perceived as often as a metallic communication is made between the diſſimilar metals. If the tongue be made to touch the two metals which form a Galvanic combination, at the ſame time that the metals are brought in contact, a taſte will be perceived, not much unlike that of an acid: and if the metals be very diſſimilar, ſuch for inſtance as ſilver and zinc, at the moment of contact, a flaſh of light will be perceived ſimilar to that produced by a blow about the eye. In ſpeaking of Galvanic combinations in future, we ſhall call that metallic ſurface which is undergoing oxydation the poſitive ſurface; the other metal, which muſt be leſs ſuſceptible of oxydation, we ſhall denominate the negative ſurface; and the oxydating medium, the interpoſed fluid.

In aſcertaining the power of any Galvanic combination we ſhall make uſe of a teſt different from either of thoſe above-mentioned, ſince it will be found more convenient and regular. It was diſcovered by Dr. Wollaſton, as we have before ſtated, that in every Galvanic combination, the negative ſurface, ſo long as the circuit is complete, is obſerved to give out bubbles of gas, which is found to be hydrogen, but that this gas ceaſes to be evolved as ſoon as the metals are ſeparated. The moſt convenient way of making theſe experiments, is with wires of the metals: the fluid in which the wires are immerſed ſhould conſiſt of water, containing $\frac{1}{10}$th or $\frac{1}{12}$ of muriatic or ſulphuric acid. The wires are firſt put into the fluid, and kept ſeparate. The zinc will be violently acted upon by decompoſition of the water, but the leſſer oxydable wire, if of platina, gold, ſilver, copper, or braſs, will not exhibit any change. If, however, the ends of the wires out of the liquid be brought into contact, an abundance of gas will be evolved from the negative wire. Zinc, with platina, gold, ſilver, and palladium, affords the greateſt quantity of hydrogen from the negative wire during contact. Zinc with copper the next. Zinc with iron very little leſs than zinc with copper. By gueſſing at the quantity of gas given out from the negative ſurface in different combinations, we have in the following table ſome idea of their relative power. The maximum is made 10, and a quantity of bubbles, which could juſt be deſcried by a magnifying glaſs, is called 1.

Poſitive

Positive Metal.	Negative Metal.	Interposed Fluid.	Effect produced.

We are under a necessity of referring the further account of this subject to the article VOLTAISM.

GALVEAS, in *Geography*, a town of Portugal, in the province of Alentejo; 24 miles W.N.W. of Estremoz.

GALVETTES, in *Navigation*, ships of war in the East Indies, on the Mahratta coast, which are constructed for carrying four, and sometimes six guns. Their chief employment is to scour the coasts of a class of pirates, named "Chamchas," who sally from the bottom of the gulf of Guzurat, and commit depredations upon trading vessels which they happen to surprise in those seas..

GALVEZIA, in *Botany*, so named by the unfortunate Dombey, in honour of the Spanish minister for Indian affairs Don Galvez, who was concerned in his appointment, and who alone of all those who had it subsequently in their power to do him justice, testified any inclination to relieve his distress; by offering him a sum of money, which however was not accepted. See DOMBEY. Juss. 119. Class and order, *Didynamia Angiospermia*. Nat. Ord. *Personatæ*, Linn. *Scrophulariæ*, Juss.

Gen. Ch. "*Cal.* Perianth small, inferior, in five segments. *Cor.* tubular, somewhat swelling at the base; limb of two lips, the upper two-lobed, the lower deeply three-cleft. *Stam.* not prominent beyond the corolla. *Stigma* one. *Peric.* Capsule globose.—A branching shrub, found in Peru, with alternate *leaves*, and solitary, axillary *flowers*." *Jussieu*, from his own herbarium and the manuscripts of Dombey.

GALUPPI. See BURANELLO.

GALUTA, in *Geography*, a town of the Arabian Irak; 5 miles N. of Shehrban.

GALWAY, a very large county of Ireland, in the province of Connaught, which is inferior in size only to the county of Cork, but the last in population of the thirty-two. It lies immediately south of Mayo, which, with part of Roscommon, forms its northern boundary; on the east it has the county of Roscommon, the King's county, and county of Tipperary; on the south, the county of Clare, and Galway bay; and on the west, the Atlantic ocean. It extends 43 Irish miles (54½ English) from north to south, and 76 Irish (96½ English) miles from E. to W. containing 989,950 acres, which are 1546 square miles Irish (in English measure 1,739,591 acres, or 2718 square miles). In this vast tract are only 116 parishes, which contain, on an average, 8534 acres each. Yet there are only 28 benefices, and as many churches, which would give upwards of 35,000 Irish acres to the care of each rector! These parishes are in the archbishopric of Tuam, and the bishoprics of Clonfert, Kilmacduagh, Elphin, aud Killaloe. The number of houses in the county of Galway, according to the last official return of the inspector-general of hearth-money in 1791, was 24,268, though Dr. Beaufort has given it as 28,212; above 20,000 of which number are exempt from the hearth-tax. Reckoning the population at six to a house, it will be about 145,000, or one person for near seven acres. "This very scanty population," says Dr. Beaufort, "may be, in some measure, accounted for, by the rude state of the three baronies on the west of lough Corrib, which amount to a third part of the county." The extensive country on this side of the lake, according to the same writer, (almost the only authority to be relied on respecting this county, and from whose memoir, therefore, the present article is chiefly extracted,) is flat, with the exception of a few fertile hills of no great height, and some low mountains on the borders of Clare. The soil is warm and fertile, covering, at no great depth, a stratum of lime-stone rock, which, in the parts adjoining the county of Clare, rises so thick above the surface as to render those parts unfit for tillage, though they are excellent for pasture. The richest part of the county is between Loughren and Portumna, thence to Eyrecourt, Clonfert, and Aghrim. Few ditches are to be seen in Galway, the fields being chiefly inclosed with dry stone-walls, which gives the country a dreary aspect. The western part of the county is of quite a different character from the rest. The district called Jarconnaught contains some good land on the sea-coast, and along the beautiful shore of lough Corrib. But the heart of this district is an assemblage of unreclaimable rock and mountain; and beyond Oughterard, mount Leam stands very high above the lake. The rocks at Oughterard, and in the bed of the river Fuogh, of which there are immense masses, are all a black and white marble, equal, at least, in beauty, to that of Kilkenny; yet, when Dr. Beaufort wrote, there was seldom employment for more than one solitary artist, in working up a few chimney-pieces. Lough Corrib somewhat resembles lough Erne in its form, and extends 20 miles in length, being

being 11 wide in the broadeſt part: in the middle it is contracted to a ſmall channel, which is croſſed by a ferry at Knock. The large barony of Ballinahinch, which is better known by the name of Connamara, abounds with fine harbours, but is alſo extremely mountainous. The hills of Ourred and Caſhel are very high, and the vaſt ridge called Beanbeolla, or the Twelve Pins, which is a well known ſea-mark, conſiſts of almoſt perperdicular rock. At the foot of this ridge, cloſe to the little village of Ballinahinch, a charming lake ſpreads itſelf for ſome miles; and on the river which runs from it into Roundſtone bay, there is a great ſalmon fiſhery. On the ſides of hills, and in the valleys, which are watered by rivers and ſmall lakes, and ſheltered, in ſome places, by the venerable remains of ancient woods, the ſoil is moſtly inclined to a black bog; but gravel, ſand, or rock, lie at no greater depth than from one to three feet below the ſurface. Great quantities of kelp are made all along the coaſt, and, by manuring with ſea-wrack, the land is rendered very productive to the ſcattered families that inhabit it, who are all little farmers and hardy fiſhermen. The northern part of this diſtrict is called Joyce's Country, and is chiefly inhabited by a clan of that name. It is alſo extremely rough; Mamtraſna, on the borders of Mayo, is very high, and Ben-Levagh, at the north-weſt angle of lough Corrib, is a ſtupendous mountain. Yet the borders of the lake, the ſhore of Killeries, and the valley through which the river Bealnabrack runs, are pretty well peopled, and the ſoil ſuch as would amply repay the pains and expence of good cultivation. This county does not appear, from the report of Mr. Donald Stewart, itinerant mineralogiſt to the Dublin Society, to promiſe much addition to the mineral treaſures of Ireland. Lime-ſtone and marle are, indeed, valuable to the agriculturiſt, and theſe are in abundance; but the only ores ſeem to be lead and manganeſe; and there is little proſpect of coal. The lead is moſt abundant in the mountains near lough Corrib. A very particular account of the rare plants found in this county, and eſpecially the wild weſtern diſtrict, was publiſhed by Dr. Wade, profeſſor of botany to the Dublin Society, in the Tranſactions of that body. To detail all of them would be tedious; but it may be uſeful to notice a few of the moſt uncommon. Aſperula cynanchia, galium boreale, alchemilla alpina, rhamnus catharticus, pimpinella magna, droſera anglica, erica daboecia (very common) andromeda polifolia, arbutus uva urſi, ſaxifraga umbroſa, and hyperoides, cratægus arica, ſorbus aucuparia, myagrum ſativum, lavatera arborea, lobelia dortmanni, are found there, with a great variety of cryptogamics. This county, which reaches from the ſea to the Shannon, is well watered by rivers and lakes: ſeveral of the rivers are, in part of their courſe, ſubterraneous. The Black river, on the bounds of Mayo, dips for about three miles near the village of Shrule. The Clare and the Moyne unite their waters under ground, alternately appearing and retiring from view in the Turlachmore; which, in winter, form a lake, and in ſummer a beautiful and found ſheep-walk, upwards of ſix miles in length, and two in breadth. Near Gort there are a vaſt number of theſe ſwallows; in which ſome part of almoſt every river and brook in the neighbourhood is ingulphed. The river Gurtnamakin dips ſeveral times, and, after a concealed courſe of two miles, riſes on the beach below high water-mark, and diſcharges itſelf among the rocks in the bay of Kinvarra. Lough Rea is a fine piece of water; and lough Coutra, near the borders of Clare, is ſaid to poſſeſs all the beauties that hills, woods, and iſlands can impart to water. The maritime advantages of this county muſt not be omitted. The vaſt bay of Galway is ſheltered at the entrance by the three ſouthern iſles of Arran. The ſound between theſe iſlands is a ſafe road; and a number of inlets on the coaſts, as well as the harbour of Galway, are ſufficiently deep for the reception of merchant ſhips; but are more frequented by coaſters and fiſhing-boats, than by veſſels in the foreign trade. The indented ſhores of Connamare abound in well-ſheltered havens. With reſpect to the agriculture of Galway, it is ſaid that tillage is rapidly increaſing: the ſoil, as before obſerved, is naturally fertile; manures are abundant; and their agriculture tolerably judicious. We here find moſt of thoſe practices, which have long diſgraced the huſbandry of the weſtern counties, no more ſtubbornly purſued; the reſident landholders generally ſet examples of enlightened tillage in their reſpective demeſnes; and, in addition to lime-ſtone, lime-ſtone gravel, and marle, ſea-wrack, and even fern and other weeds, which the inhabitants collect and rot, prove good manures. The fruits of labour are rich crops of oats, barley, potatoes, and ſometimes wheat. But the climate of this hilly and weſtern region is too variable, humid, and tempeſtuous even to permit crops of grain to grow and ripen here, ſo happily as in the ſouthern and eaſtern parts of Ireland. Nor have the inhabitants of Galway acquired thoſe vigilant and enlightened habits of induſtry ſo eſſentially requiſite to enſure ſucceſs to their mode of huſbandry. The linen manufacture has of late years increaſed in this diſtrict, eſpecially near lough Rea, and bleach greens in proportion. The fiſheries on the coaſt alſo add conſiderably to the means of employment and ſupport. The villages in the eaſtern part are numerous and cheerful, but in the higher, or weſtern regions, there are very few, and theſe the abode of poverty and miſery. Nothing, however, ſtrikes a ſtranger more forcibly than the vaſt number of old caſtles and churches in ruins, or on the brink of decay, that occur in this diſtrict, "pourtraying," ſays a late writer, "the warlike character of former inhabitants, their noble eſtabliſhments, their religious zeal, or the power of their chieftains, and inſpiring a train of reflections agreeably diſpelled by the numerous modern manſions, that direct to ſcenes of natural beauty, rural improvement, or to a tenantry enjoying the bleſſings of proſperity and peace. The county of Galway is repreſented in parliament by three members, two for the county, and one for the town of Galway. Beaufort's Memoir of Meſſrs. Robertſons' View of Ireland.

GALWAY, the chief town of the county of the ſame name in Ireland; and formerly, when each province had a diſtinct governor, the capital of Connaught. It is ſituated on the broad and ſtony river by which lough Corrib empties itſelf into the ſea. It does not cover a very large ſpace, but being very compact, and having little waſte ground within its ancient and mouldering walls, it contains a great number of inhabitants. They may be eſtimated at 12,000, though there are but 950 houſes; for the greater part of this ancient town conſiſts of ſquare edifices at leaſt 200 years old, with each a ſmall court in the centre. Several diſtinct families occupy theſe large houſes; an arched way, leading from the ſtreet to the court, with a ſtone ſtaircaſe on each ſide. The ſtreets are long and narrow. This was formerly the moſt commercial town in Ireland; but the ſpirit of enterpriſe has long ſince forſaken it; and though it has ſtill ſome commerce, it has been left behind by many other places. No veſſels come up as far as the town; but the goods are conveyed backward and forward by lighters. The linen manufacture, and the various fiſheries along the coaſt, are the chief employment of the inhabitants. The collegiate church, of which the conſtitution and privileges are unique in Ireland, is very large. The government of the town is placed in a mayor, ſheriffs, and recorder; and the freemen return a member to the imperial parliament. The public buildings in Galway,

beſides

beſides the collegiate church already mentioned, which is of Gothic ſtructure, are an exchange, three nunneries, three monaſteries, commodious barracks for two or three regiments of infantry, a charter ſchool, and an hoſpital. Galway is a poſt and fair-town, and is ſituated 102 miles weſt from Dublin. N. lat. 53° 14′. W. long. 8° 5′ from Greenwich. Beaufort. Robertſon's Book of Roads.

GALWAY *Bay*, a large bay in the weſt of Ireland, twenty miles long, and ſeven miles broad, the north ſide of which has ſeveral ſhoals and blind rocks, ſome of which are called the ſtags of Arran, but the north ſide of it is ſafer. The three iſles of Arran ſhelter the entrance, and cauſe no leſs than four paſſages into the bay.

GALWAY, a poſt town of America, in the county of Saratoga, New York; W. of Ballſtown, and containing 2310 inhabitants.

GALYBE, in *Ancient Geography*, a town of Africa Propria, ſituated between the two Syrtes, according to Ptolemy.

GALZHA, in *Geography*, a town of European Turkey, in Bulgaria, on the Black ſea; 10 miles S. of Varna.

GAMA, VASCO, VASQUEZ DI, in *Biography*, a celebrated navigator, was born at Synes, a maritime town in the Portugueſe province of Alentejo, and being of an enterpriſing ſpirit he was devoted to the ſea-ſervice, in which he ſoon diſtinguiſhed himſelf. When king Emanuel determined to puſh his diſcoveries in the Eaſt, Di Gama was fixed on to conduct the expedition. He accordingly ſet ſail from Liſbon with a ſquadron of four ſmall veſſels in July 1497. Such, however, was the ſtate of navigation at that time, that he was four months contending with contrary winds before he reached the Cape of Good Hope. At length he was fortunate enough to double that cape, which had hitherto baffled the attempts of all his countrymen, and which had been the conſtant object of their terror and anxious hope. Thence he proceeded along the ſouth-eaſt coaſt of Africa, till he arrived at Melinda; where he had the high ſatisfaction to find a people far advanced in civilization, and engaged in active commerce with the remote countries of Aſia. Here he procured a Mahometan pilot, who conducted him to the Malabar coaſt, and on the 22d of May he arrived at Calicut. He was received in a friendly manner by the prince, and Gama conducted himſelf with ſo much prudence and reſolution in his intercourſe with the natives, that he was allowed to freight his ſhip with many of the moſt valuable productions of the Eaſt. At length the Mahometan merchants, jealous of his ſucceſs, laid a plot for his deſtruction; upon the diſcovery of which Di Gama embarked with all his treaſures, and returned to Portugal, where he was received with every teſtimony of gratitude and reſpect by the king and nation. He entered the port of Liſbon in September 1499, having had, however, the misfortune to loſe the greater part of his crew by diſeaſe and fatigue. This expedition completely eſtabliſhed the practicability of a new road to the Indies, and other naval commanders were ſent out upon ſimilar expeditions.

Di Gama was employed in a ſecond voyage, in which he had the command of a conſiderable fleet, and was honoured by his ſovereign with the title of admiral of the Indian, Perſian, and Arabian ſeas. In the courſe of this voyage, which he commenced in 1502, he compelled tribute from, or an alliance with, the petty princes that he met with in his route: when he arrived at Cochin he received a deputation from the Chriſtians of St. Thomas, to whom he promiſed protection. The prince, who began to be ſuſpicious of the motives of his viſitors, fitted out a fleet to intercept them in their courſe, hoping, no doubt, to put an end to their future projects; but Di Gama, underſtanding their intentions, began the attack with a degree of ardour little expected by the combatants, and boarded and took two of the largeſt ſhips, which proved to be prizes of immenſe value. After this ſucceſs he returned, and landed at Liſbon in September 1503. The ſucceſs of this voyage occaſioned great rejoicings in Portugal, and the government ſet about the means of ſecuring the eſtabliſhments it had made in India, and of extending them by conqueſt. We hear little more of Di Gama till the year 1524, when he was prevailed on to undertake a third voyage, with the rank of viceroy of the Indies. He proceeded to Cochin, was victorious againſt the people of Calicut, who attempted to fruſtrate his deſigns, and achieved other things of importance, when he died December 25, 1525. He left two ſons, Don Stephen and Don Chriſtopher, who were afterwards viceroys of the Indies, and who are noticed with applauſe and honour in hiſtory. Robertſon's Hiſt. of America. Mod. Univer. Hiſt.

GAMACHES, STEPHEN SIMON, was born at Meulan about the year 1672, and, being educated for the church, he obtained the office of canon of the Holy Croſs de la Bretonniere, and acquired ſo much reputation by his proficiency in ſcience and literature that he was elected a member of the French Academy of Sciences. He died in the year 1756 in the 84th year of his age, leaving behind him, beſides other works, "Phyſical Aſtronomy," in two vols. 4to.; "Literary and Philoſophical Diſſertations;" "The Syſtem of a Chriſtian Philoſopher;" "The Elegancies of Language reduced to their Principles." This laſt has been recommended as deſerving the peruſal of every perſon who is deſirous of a good ſtyle: it has been denominated "A Dictionary of fine Thoughts." Nouv. Dict. Hiſt.

GAMACHES, in *Geography*, a town of France, in the department of the Somme, and chief place of a canton in the diſtrict of Abbeville; 12 miles S. of Abbeville. The place contains 1037, and the canton 10,093 inhabitants, on a territory of 165 kiliometres, in 21 communes.

GAMALA, or GAMAL, in *Ancient Geography*, a town of Paleſtine, beyond Jordan, in the Gaulanitis, ſo called becauſe, being ſituated on a high mountain, its form reſembled that of a camel. It was part of the kingdom of Agrippa; but as the inhabitants refuſed to ſubmit to him, it was beſieged, firſt by the forces of Agrippa and afterwards by the Romans, who, after a long ſiege, took and ſacked it. It was afterwards fortified, and taken by Veſpaſian, who put the inhabitants to death, precipitating many of them from the ſummit of the citadel. Herod repaired it, and changed its name into "Herodium," but the ancient appellation prevailed.

GAMALIBA, a town of India, on this ſide of the Ganges, mentioned by Ptolemy.

GAMALIEL, ſurnamed the *Aged*, in *Scripture Biography*, an eminent Jewiſh rabbi in the firſt age of Chriſtianity, ſuppoſed to be St. Paul's maſter, and mentioned by him, Acts, xxii. 3, and in chap. v. 34, to be "one of the council, a phariſee and doctor of the law, had in reputation with all the people." Accordingly he appears from other teſtimonies to have been held in high eſtimation by the Jewiſh people, and he is often mentioned in the Miſhna. We have ample evidence that Gamaliel was never converted to Chriſtianity, as ſome Chriſtians, eſpecially of the church of Rome, have fondly and weakly imagined. Indeed, from the account given of him by St. Paul in the paſſage above cited, it may be argued that he was ſtill a firm Jew; otherwiſe it had not been to the purpoſe to take notice of his education under him, in the critical circumſtance in which he was then ſituated.

Gamaliel's argument in favour of the apoſtles (Acts, v. 37, &c.), which ſome interpreters have miſunderſtood, is thus ſtated by the judicious Dr. Lardner (Works, vol. i. p. 255.): Theudas and his meaſures came to nothing. After him Judas roſe up; he himſelf periſhed, and his people were diſperſed: but yet his principles prevail. You likewiſe may now puniſh theſe men, and put an end to their lives; but if their principles be of God, they will prevail notwithſtanding; and all the iſſue will be, that you will contract guilt, fight againſt God, but in vain. And to this ſeems to be owing the great ſucceſs of Gamaliel's reaſoning, and the ſervice he did the apoſtles at this time. He inſinuates ſome hopes, that their deſign might be of the ſame nature with Judas's. This may be inferred from his way of expreſſing himſelf, "leſt haply ye be found to fight againſt God." This was Judas's peculiar principle, that they were to own no mortal lords, but God only. And it is not unlikely, that Gamaliel intended hereby to inſinuate, not only that there was danger of oppoſing a deſign which came from God, and of oppoſing it with no other effect but that of contracting guilt to themſelves, but alſo of oppoſing the very kingdom and government of God, to which they wiſhed to be ſubject. It deſerves likewiſe to be obſerved, that Gamaliel mentions Theudas with contempt and indignation: "Before theſe days roſe up Theudas, boaſting himſelf to be ſomebody." But nothing like this follows the mention of Judas. Gamaliel concludes, upon the whole, that they ſhould "let theſe men alone." We have no occaſion to meddle in this matter; it is not unlikely but the Romans, our preſent governors, will be jealous of theſe men. But it ſeems to me an affair, in which we have no reaſon to concern ourſelves.

GAMAREA, in *Ancient Geography*, a ſmall country of Media, according to Diodorus Siculus.

GAMAZE', in *Geography*, a town of Egypt; 12 miles N. of Atſieh.

GAMBA, *Ital. the leg;* as *viol di gamba*, a baſe viol, that reſts on the *leg*, to diſtinguiſh it from *viola di braccia*, or a tenor viol, that reſts on the arm.

GAMBACH, in *Geography*, a town of Germany, in the principality of Solms Braunfels; 2 miles W. of Munzenberg.

GAMBALONE, or GAMBUOLO, a town of Italy, in the department of the Upper Po.

GAMBARA, LORENZO, in *Biography*, was born at Breſcia about the year 1496, and became diſtinguiſhed as a Latin poet. He acquired conſiderable celebrity among his contemporaries, and is mentioned with reſpect and honour by Manutius, Lipſius, Gyraldus, and others. He lived to the great age of ninety. His works are numerous, and they have paſſed through many editions. Among his larger pieces, his "Columbus," a poem in four cantos, is the beſt known. The ſubject of it is, as its title imports, the diſcovery of America, and it follows the order of events as they are recorded of the great navigator, without any decorations of fiction, and therefore is ſcarcely to be admitted among the rank of epic poems. In his youth he had written a great number of poems which were evidently injurious to the cauſe of morality: theſe, in his advanced years, he committed to the flames, and in his treatiſe "On the Art of Poetry," he not only condemns every thing injurious to virtue, but prohibits the uſe of heathen mythology. Moreri.

GAMBARA, VERONICA, an Italian literary lady, was born at Breſcia in the year 1485. She received a good education, and was aided and encouraged in her literary purſuits by a correſpondence with cardinal Bembo. In 1509 ſhe married Giberto, the lord of Corregio, with whom ſhe lived nine years, and after his death ſhe devoted her time and talents to the education of her two ſons, and to the compoſition of thoſe works which have given celebrity to her name. In 1528 ſhe fixed her reſidence in Bologna, and at the time of the coronation of the emperor Charles V. her houſe was the reſort of a number of the moſt diſtinguiſhed characters in Europe, who followed that prince's court. She died at Corregio in 1550, and in 1559 her poems, which had hitherto been printed in varions collections, were publiſhed with her letters in a complete edition at Breſcia. Gen. Biog.

GAMBARA, in *Geography*, a town of Italy, in the department of the Mela; 18 miles S. of Breſcia.—Alſo, a town of Italy, on the Brenta; 5 miles S. W. of Venice.

GAMBARA, a town of Italy, in the duchy of Piacenza; 24 miles S. of Piacenza.

GAMBASCA, a town of France, in the department of the Stura, ſeated on a ſmall river which runs into the Po; 6 miles W. of Saluzzo.

GAMBESON, GAMBEYSON, *Gambeſo*, in the *Ancient Military Language*, was a kind of coat or doublet, worn under the cuiraſs, to make it ſit eaſy, and prevent its hurting the body.

It was made of wool or cotton, quilted between two ſtuffs; and was likewiſe called counter-point.

Others define the gambeſon a kind of ſoft quilted waiſtcoat, worn under the coat of mail, and hanging down over the thighs.

"Pectora tot coriis, tot gambeſonibus ornat."

GAMBET, in *Ornithology*, the Engliſh name of TRINGA *Gambetta*, which ſee.

GAMBIA, in *Geography*, a country of Africa, which takes its name from the river that paſſes through it; ceded to England by the peace of 1783. The river, called alſo Gambra and Gamba, empties itſelf into the Atlantic, and is ſuppoſed by ſome to be a branch of the Niger. Its ſource is not known, but it is navigable for ſloops 600 miles into the interior of the country. It annually overflows its banks like the Nile, and probably from the ſame cauſe. Its mouth is in N. lat. 13° 30'. W. long. 16° 30'.

GAMBIER'S ISLANDS, a group of ſmall iſlands diſcovered by captain Wilſon of the Duff, in the miſſionary voyage, May 1797; about 5 or 6 leagues in length, ſituated N.E. by N. and S.W. by S. A reef, lying about three leagues from the largeſt of theſe iſlands, and probably encircling the whole group, extended as far as the eye could reach, on which were ſeveral dry ſpots bearing cluſters of trees. The inhabitants oppoſed every attempt to land. The main iſland, and thoſe about it are all high; and as the reef kept the ſea calm about them, they preſented a romantic, though barren appearance. The vallies, however, were covered with trees. "Duff's mountains," ſo called by Capt. Wilſon from the name of his ſhip, are two lofty mountains, viſible at the diſtance of fourteen or fifteen leagues, which lie in the centre, and are ſituated in S. lat. 23° 12'. E. long. 225°.

GAMBINO, a river of Italy, formed by ſeveral ſtreams, which run into the Oglio, near Torne d'Oglio.

GAMBLE'S STATION, an American fort, about 12 miles from Knoxville, in Teneſſee.

GAMBOGE, or CAMBOGIA *Gutta*, is a concrete, gummy, reſinous juice of a certain tree growing wild in Cambogia or Cambodia, Ceylon, Siam, and Cochinchina, and called by botaniſts "Stalagmitis gambogioides." The Siameſe gamboge occurs in ſmall tears, formed by the concretion of the drops of juice as they fall from the leaf-ſtalks and young

young ſhoots when they are broken off from the tree. In Ceylon the juice is procured by deep inciſions in the bark, and is afterwards inſpiſſated by the heat of the ſun, and moulded into cakes or rolls. Its colour, when pure, is a deep, rather dull orange; its fracture is conchoidal and ſomewhat ſhining. It has no ſmell, and very little taſte, but after remaining for ſome time in the mouth gives a ſlight impreſſion of acrimony. When applied to the flame of a candle it melts and blazes, throwing out ſparks, and emitting a denſe black ſmoke. Gamboge, though not properly ſoluble, is very diffuſible in water, and forms with it an opake yellow-coloured infuſion; and if the liquor be filtered ſome reſin is obtained; but the fluid remains coloured and turbid. With alcohol, which is a more effectual ſolvent than water, gamboge forms a clear gold-coloured fluid; and on the addition of water the alcoholic ſolution becomes turbid like the watery infuſion. Of 16 ounces of gamboge, water, according to Neumann, will take up 13 ounces; and two ounces of the reſidue are ſoluble in alcohol: of an equal quantity alcohol will firſt diſſolve 14 ounces, and one ounce of the reſidue is ſoluble in water: and in both caſes the inſoluble matter amounts to one-ſixteenth of the whole. Both the fixed alkalies and ammonia effect almoſt a total ſolution of gamboge, and produce a clear liquor, of a deep and rich red-brown colour; the reſidue, being pure gum, is entirely ſoluble in water. The addition of an acid to the alkaline ſolution throws down a copious yellow precipitate, which, dried, preſents an earthy fracture, is combuſtible with difficulty, and does not melt like the pure reſin. Aikin's Chem. Dict.

If this ſubſtance be mixed with an equal quantity of ſalt of tartar, it readily diſſolves in common water in a few hours digeſtion; the ſolution, if kept over the fire, ſoon becomes a ſort of ſmooth glue or jelly: and this, by adding a large quantity of water, is readily reduced into a red clear liquor, in a warm digeſtion: this liquor, evaporated over a gentle fire, yields a greyiſh ſalt, which eaſily imbibes moiſture from the air, if not kept in a glaſs well ſtopped; and this extract purges in a ſmaller doſe than the gum itſelf, and yet with leſs irritation; its taſte, however, is extremely acrimonious and fiery, and it muſt therefore be well diſguiſed before it is given. There is, however, another method of giving it, yet more to be recommended than this for general uſe; this preparation is as follows: Tie up the gum in a piece of linen cloth, and put it into a loaf juſt drawn from the oven; the loaf muſt be cut open for this purpoſe, and afterwards tied cloſe together, and ſet in ſome place where it will remain warm four and twenty hours; after this the gum is to be taken out and reduced to powder, and this powder tied up again, and put into another loaf and ſo on to the fourth or fifth time; after which it is to be powdered and kept for uſe. By this eaſy preparation this medicine loſes its violent operation, both as a purgative and emetic, and may be given with great ſafety; and the crumb of the firſt loaf, if eaten, proves purgative. Mem. Acad. Par. 1701.

In ſuch hydropic caſes as require the briſker cathartics, and in other diſorders accompanied with a redundance of ſerous humours, it is an uſeful and ſafe hydragogue; in hot, dry, bilious conſtitutions, it is never to be adminiſtered. In all caſes it is apt, on firſt uſing it, to vomit as well as purge.

The doſe is from two grains to twelve. The emetic power of this medicine is reſtrained by joining it to mercurius dulcis. The compound pills of gamboge are prepared in the following manner: Take of gamboge powdered, extract of ſpike aloe powdered, compound cinnamon powder, of each a drachm; and hard ſoap, two drachms. Mix the powders together; then, having added the ſoap, beat the whole together until they are thoroughly incorporated. The doſe is from five grains to a ſcruple. Pharmac. Lond. 1809.

Solutions of gamboge in alkalized water, and in dulcified alkaline ſpirits, act only by ſtool and urine, and much more mildly than the juice in ſubſtance. The watery tincture is ſtill milder; but the ſpirituous tincture operates with extreme irritation both upwards and downwards. Lewis's Mat. Med.

Gamboge, diſſolved in water, forms a beautiful yellow pigment, and is much uſed as ſuch by painters. Its tincture in alcohol is one of the ingredients of the gold coloured lacquer with which moſt of the modern articles that are made of braſs are overlaid. It is alſo employed by the inlayer and cabinet-maker to ſtain white wood in imitation of box. Dr. Lewis ſays, that it gives a beautiful and durable citron yellow ſtain to marble, whether rubbed in ſubſtance on the hot ſtone, or applied, as dragon's blood ſometimes is, in form of a ſpirituous tincture. When it is applied on cold marble, the ſtone is afterwards heated, to make the colour penetrate. Neumann's Chem. by Lewis, p. 300. note *m*.

GAMBOLD, John, in *Biography*, a pious Engliſh divine, was born at Haverfordweſt in Pembrokeſhire, and at a proper time became a member of Chriſt college, Oxford. In 1734 he took his degree of M.A., and was made chaplain of the college. About the year 1739 he was preſented to a living by Dr. Secker, but previouſly to this he had acted as interpreter to Peter Boehler, a diſciple of count Zinzendorf. This perſon held frequent conferences with the two Weſleys and others of the party, who in 1738 were laying the foundations of methodiſm. Boehler explained his miſſion and doctrines in the Latin language; theſe Gambold interpreted in his diſcourſe to the mixed meetings of learned and unlearned perſons who aſſumed the title of "awakened people." This was the foundation of his own converſion to the Moravian ſyſtem of religion, into which he ſo fully entered, as to abandon his preferment in the eſtabliſhed church, and publicly to join himſelf to the new ſect, which by a public act of the legiſlature was permitted to erect its eſtabliſhments in this country. For many years he was the regular miniſter of the congregation that met in Fetter-lane, London. In 1768 he retired to his native country, where he died, univerſally reſpected, in the year 1771. He was a ſingular, zealous, but innocent enthuſiaſt; but notwithſtanding his avowal of doctrines incompatible with thoſe in which he had been brought up, he reckoned among his friends ſeveral of the Engliſh biſhops who had been his contemporaries at Oxford. Among the Moravians he himſelf had been conſecrated a biſhop at an Engliſh provincial ſynod held at Chelſea. He was a good ſcholar, and was frequently applied to by Mr. Bowyer to aſſiſt in correcting the preſs, in which capacity he ſuperintended, among other valuable publications, the beautiful and accurate edition of Bacon's works in 1765, and in 1767 he was editor, and in part tranſlator, of Crantz's "Hiſtory of Greenland." He was editor of a neat edition of the Greek Teſtament, and publiſhed, as an original author, ſeveral theological pieces; an account of which, with other particulars of his life and labours, may be found in the Anecdotes of Bowyer, by Nichols.

GAMBON, in *Geography*, a river of France, which runs into the Seine, near Andely.

GAMBRON, or Gambroon, or *Bender-Abbas*, a ſea-port town of Perſia, in the province of Lariſtan, ſituated on the Perſian gulf, and formerly belonging to the Perſian monarch. After the death of Nadir-ſhah, a Perſian, named

Naſer-Khan, made himſelf maſter of the province, and conſequently of the city. He acknowledges himſelf vaſſal to Vakeil Kerim Khan of Schiraz, but pays no tribute, and unleſs he is compelled by an army, manifeſts no reſpect for the Vakeil's authority. This city was famous, in the 17th and beginning of the 18th centuries, as the port of Schiraz, and of the ſouth of Perſia, and then its trade was very extenſive. At preſent, ſays Niebuhr, it is very low; nor is there a ſingle European counting-houſe in the city. This decline has been occaſioned by the domeſtic diſturbances in Perſia, and the wars and diſputes between the French and Engliſh. The Dutch for a while continued to carry on a petty trade here; but ſince they formed a ſettlement in the iſle of Karek, they have entirely deſerted Gambron. N. lat. 27° 7'. E. long. 56° 44'.

GAMBROVISSA, a town of Iſtria; nine miles E. of Capo d'Iſtria.

GAMBS, a bailliage and town of Switzerland. This bailliage, which lies S. of Appenzel, and E. of the Rhine, is ſubject to the cantons of Schweitz and Glarus; and, together with Gaſter and Urnach, comprehends 149 ſquare geographical miles, with a population of 9000 perſons. Gambs has a medicinal ſulphurous ſpring; five miles S. of Appenzel.

GAME, Ludus, a regular diverſion, or a ſport preſcribed and limited by rules.

Games may be diſtinguiſhed into thoſe of exerciſe and addreſs; and thoſe of chance or hazard.

To the firſt belong tennis, billiards, cheſs, bowls, cudgels, wreſtling, quoits, ſhooting with bows, &c.

To theſe alſo belong the ancient juſts and tournaments.

Under the ſecond come cards and dice, &c.

Under cards, again, come ſeveral ſubordinate games; the principal of which are ombre, picquet, baſſet, whiſt, &c.

Games, *Ludi*, in the plural, were ſhews, or public repreſentations, uſed among the ancients on religious, funerary, and other ſolemn occaſions.

Such, among the Greeks, were the Olympic, Pythian, Iſthmian, and Nemæan games.

Among the Romans there were three ſorts of games, *ſacred*, *honorary*, and *ludicrous*: and Auſonius obſerves a difference, ſomewhat of the ſame kind, among thoſe of the Greeks; two of their celebrated games being dedicated to gods, and two to heroes.

Games, *Sacred*, were thoſe inſtituted immediately in honour of ſome deity: of which kind there were the ludi Cereales, Florales, Martiales, Apollinares, Megalenſes, Romani, conſuales or Circenſes, Capitolini, Seculares, Plebeii, Compitalitii, Auguſtales, Palatini, and Votivi. See each deſcribed in its place.

To this claſs may alſo be referred thoſe celebrated in memory of ſome illuſtrious perſon or action; as the ludi Neroniani, and Actiaci, &c.

Authors mention a decree of the Roman ſenate, by which it was enacted, that the public games ſhould be conſecrated, and united with the worſhip of the gods, as a part thereof; and, accordingly, feaſts, ſacrifices, and games, appear to have made up the greateſt part, or rather the whole, of the external worſhip or ſervice offered to the deities of the Romans.

Games, *Funeral*. See Funeral *games*.

Games, *Honorary*, *ludi honorarii*, were thoſe exhibited by private perſons out of their own purſe, in order to gratify the people, or ingratiate themſelves with them, to make way for their own preferment. Such were the combats of gladiators, ſcenic games, tragedies, comedies, and other theatrical and amphitheatrical ſports.

Games, *Ludicrous*, were of the ſame kind with the games of exerciſe and hazard among us. Such were the ludus Trojanus, or Pyrrhius; the teſſeræ, and tali or dice; and the latrunculi, or cheſs; the diſcus, or quoit; the pila, ball; trocheus, top; nuces, or par impar, odd and even, with nuts; harpaſtum, foot-ball; capita vel navem; croſs and pile, &c.

Others diſtinguiſh the ancient games into three claſſes, *viz.* races, combats, and ſpectacles. The firſt were called equeſtrian, or curule games, ludi equeſtres, or curules; being races of horſes and chariots, performed in the circus in honour of the Sun and Neptune.

The ſecond were called agonales, or gymnici; being combats of men or beaſts in the amphitheatre, dedicated to Mars and Minerva.

The laſt, called ſcenici, poetici, and muſici, were tragedies, comedies, balls, &c. repreſented on the theatres, ſacred to Venus, Bacchus, Apollo, and Minerva.

Homer gives us a fine deſcription of the games which Achilles inſtituted at the funeral of his friend Patroclus, in his Iliad; and others of the different games held among the Pheaces, Ithacans, and at the court of Alcinous, in his Odyſſey. And Virgil's deſcription of the games celebrated by Æneas, at the funeral of old Anchiſes, is not inferior to any of them.

Games, *Secular*. See Secular.

Games, *Muſical*, in the *Greek Antiquity*, games, in almoſt all which there were muſical contentions, and honours and prizes conferred on ſuperior merit.

At all the four principal public games in Greece, it appears that poetry and muſic had their heroes. Indeed muſical contentions for ſuperiority, both vocal and inſtrumental, are of ſuch high antiquity, as to have preceded the regular eſtabliſhment of public games. The ſinging was ſometimes alone, and ſometimes accompanied by inſtruments, and particularly by ſtringed inſtruments; as poets who compoſed verſes for muſic were called lyrics, that is, ſuch as accompanied themſelves on the lyre. (See Pauſanias Meſſenic. cap. 83.) But the inſtruments which uſually accompanied the voice, were the cithara, the lyre, the flute, trumpet, and buccina. As all ancient poetry was ſung, poets repeating their verſes without inſtrumental accompaniments, always did it to vocal melody, not in the indeterminate tones of common ſpeech, but in ſuch ſounds as belonged to the Μελος or Μελοποιια. We ſhould ſuppoſe that when any voice, except that of Stentor himſelf, was accompanied by a trumpet or buccina, it muſt have been in *ritornels*, or repetitions of portions of the ſame melody, as had been previouſly ſung, in order to afford the ſinger time to breathe.

From Plutarch we learn that occaſional muſical conteſts preceded the regular eſtabliſhment of any of the public games. (Quæſt. Conviv.) The ſame author (de Muſica) after enumerating the airs which Terpander had compoſed, and to which he had given names, continues to ſpeak of his other compoſitions, among which he deſcribes the proems, or hymns for the cithara, in heroic verſe. Theſe were uſed in after-times, by the rhapſodiſts, as prologues, or introductions to the poems of Homer, and other ancient writers. But Terpander rendered his name illuſtrious, no leſs by his performance, both upon the flute and cithara, than by his compoſitions. This appears by the marbles; by a paſſage in Athenæus, from the hiſtorian Hellanicus, which informs us that he obtained the firſt prize in the muſical conteſts at the Carnean games; and by the teſtimony of Plutarch, who ſays, that "no other proof need be urged of the excellence of Terpander, in the art of playing upon the cithara, than what is given by the regiſter of the Pythic games, from

which it appears that he gained four prizes, ſucceſſively, at thoſe ſolemnities."

After ſpeaking of the victories obtained by this venerable bard, at the public games, it ſeems neceſſary to be ſomewhat minute in deſcribing theſe memorable inſtitutions, as far as they concern muſic. And, in order to convey to the reader as clear an idea as we are able, of the rank which muſic and muſicians held at theſe aſſemblies, we ſhall give ſome account of each of the four principal or ſacred games, ſeparately; and firſt, *of the Olympic games*.

Thucydides tells us that in very remote antiquity there were "games of bodily exerciſe, and of muſic, in which cities exhibited their reſpective choruſes;" and, in teſtimony of this, he quotes the following verſes from Homer's hymn to Apollo:

"To thee, O Phœbus, moſt the Delian iſle
Gives cordial joy, excites the pleaſing ſmile;
When gay Ionians flock around thy fane;
Men, women, children, a reſplendent train,
Whoſe flowing garments ſweep the ſacred pile,
Whoſe grateful concourſe gladdens all the iſle,
Where champions fight, where dancers beat the ground,
Where chearful muſic echoes all around,
Thy feaſt to honour and thy praiſe to ſound."

That there was alſo, continues Thucydides, a muſical game, to which artiſts reſorted to make trials of ſkill, Homer fully ſhews in other verſes to be found in the ſame hymn: for having ſung the Delian chorus of females, he cloſes their praiſe with theſe lines, in which he makes ſome mention of himſelf;

"Hail! great Apollo, radiant god of day!
Hail Cynthia, goddeſs of the lunar ſway!
Henceforth on me propitious ſmile! and you,
Ye blooming beauties of the iſle, adieu!
When future gueſts ſhall reach your happy ſhore,
And refug'd here from toils, lament no more;
When ſocial talk the mind-unbending chears,
And this demand ſhall greet your friendly ears—
Who was the bard, e'er landed on your coaſt,
That ſung the ſweeteſt, and that pleaſed you moſt?—
With voice united, all ye blooming fair,
Join in your anſwer, and for me declare;
Say—the blind bard the ſweeteſt notes may boaſt,
He lives at Chios, and he pleaſ'd us moſt."
Smith's Thucydides.

We cannot help pointing out another circumſtance in this hymn, which is really curious, as it implies the cultivation of a talent for imitation, at a time when ſimplicity and original genius ſeem moſt likely to have ſubſiſted, pure and untainted, by ludicrous ſimilitudes.

Homer, in verſe 162, deſcribing the employment of the Delian prieſteſſes, or nuns of the order of Saint Apollo of Delos, tells us, that they were great adepts in the art of mimickry; and that part of the entertainment which they afforded to the numerous people of different nations, who formed their congregation, was, as the poet expreſſes it, from their being ſkilled to imitate the voices and the pulſation, or meaſure, of all nations: and ſo exactly was their ſong adapted, that every man would think he himſelf was ſinging.

Homer ſeems to ſketch out the order of the performance in theſe old Pagan conſervatorios, v. 158: firſt they ſung a hymn in praiſe of Apollo: then another in praiſe of Latona and Diana: then they deſcended to the celebration of human heroes and heroines of ancient times; and it ſeems to have been in this part of their performance that they exerted their mimetic powers, and charmed the nations.

Though Mr. Weſt, in his "Diſſertation on the Olympic Games," publiſhed with ſome of the odes of Pindar, tells us, that theſe aſſemblies were frequented by perſons of the greateſt eminence in all the arts of peace, ſuch as hiſtorians, orators, philoſophers, poets, and painters; who perceiving that the moſt compendious way to fame lay through Olympia, were there induced to exhibit their beſt performances, at the time of the celebration of the Olympic games; yet he has wholly omitted to mention poetical and muſical conteſts, though both can be proved to have had frequent admiſſion there. Indeed theſe were not the principal contentions at Olympia, as they were at Delphos, and in ſome other public games; being ſubordinate to the athletic and gymnaſtic exerciſes, and no part of the pentathlon, or five bodily exerciſes, of leaping, running, throwing the quoit or dart, boxing and wreſtling; though even theſe were accompanied by the flute; for Pauſanias ſays that Pythocritus of Sicyon played ſix times upon the flute during the exerciſe of the pentathlon at Olympia; and in teſtimony of the ſkill and abilities which he manifeſted in his art, a pillar and ſtatue were erected to him with this inſcription:

ΠΥΘΟΚΡΙΤΟΥ
ΚΑΛΑΙΝΙΚΟΥ
ΜΝΑΜΑΤΑ
ΑΥΛΗΤΑ

"To the memory of Pythocritus, victor upon the flute." We have the ſame authority for the horſe-race being accompanied by the trumpet; and many ancient writers tell us that the chariot-race was likewiſe accompanied by the flute.

Pauſanias alſo remarks, that there was a Gymnaſium near Olympia, called Lolichmium, which was open at all times to thoſe who were deſirous of trying their powers in literary combats of every kind, where muſic, as the conſtant companion of poetry, could not have been excluded.

Ælian tells us likewiſe, that, in the 91ſt Olympiad, 416 B. C., Xenocles and Euripides diſputed the prize of dramatic poetry at the Olympic games. Now dramatic poetry was at this time always ſet to muſic, ſung, and accompanied by inſtruments, when performed on the ſtage; it is probable, therefore, that the caſe was the ſame at a public recital; at leaſt with reſpect to the lyric part of the drama.

In the 96th Olympiad, 396 B. C. a prize was inſtituted at the Olympic games for the beſt performer on the trumpet. The firſt performer on this inſtrument, who gained a prize at theſe celebrations, was Timæus of Elis (Αναγεφ, Olym. ad Calc. Chron. Euſeb.). His countryman Crates obtained one there the ſame year, on the cornet, or horn. Archias of Hybla, in Sicily, was victor on the trumpet at three ſeveral Olympiads, after this period. Theſe premiums ſeem not to have been temporary, but to have been continued long after their firſt eſtabliſhment; for Athenæus informs us, that the famous trumpeter, Herodorus of Megara, was victor at the Olympic games ten ſeveral times. Jul. Pollux ſays fifteen. Theſe writers muſt mean that he obtained ſo many prizes at the different games of Greece; as Athenæus informs us, that he was victor in the whole circle of ſacred games, having been crowned at the Olympian, Pythian, Nemean, and Iſthmian, by turns.

Theſe performers on the trumpet appear to have been heralds and public cryers; who not only gave the ſignals at the games for the combatants to engage, and announced their

their ſucceſs, but proclaimed peace and war, and founded ſignals of ſacrifice and ſilence, at religious ceremonies.

As Herodorus is allowed to have been cotemporary with Demetrius Poliorcetes, he may be placed about the 120th Olymp. 300 B. C. According to the authors already cited, he was as remarkable for his gigantic figure and enormous appetite, as for the ſtrength of his lungs, which were ſo powerful in blowing the trumpet, that he could not be heard with ſafety, unleſs at a great diſtance. But, upon theſe occaſions, the danger was not always confined to the hearers; the performers themſelves, ſometimes, ſeem to have exulted, and to have been very thankful that they found themſelves alive and well, when their ſolos were ended. An epigram of Archias, the Hyblæan trumpeter, is preſerved in Jul. Pollux, in which he dedicates a ſtatue to Apollo, in gratitude for his having been enabled to proclaim the Olympic games with his trumpet, three times, without burſting his cheeks, or a blood-veſſel, though he ſounded with all his force, and without a capiſtrum, or muzzle.

Even the flute had its dangers, if Lucian may be credited, who relates, with the appearance of great gravity, that Harmonides, a young flute-player, and ſcholar of Timotheus, at his firſt public performance, in order to aſtoniſh his hearers, began his ſolo with ſo violent a blaſt, that he breathed his laſt breath into his flute, and died upon the ſpot.

This account is ſo extraordinary, that it ſeems to require the teſtimony of the author's own words: εναπεπνευσεν τω αυλω, *breathed his laſt breath into the flute;* and εν τα σκηνη απεθανε, *he died upon the ſtage.*

Plutarch, and ſeveral ancient writers, ſpeak of a kind of paſticcio performance at the public games among the rhapſodiſts, who uſed to collect together favourite paſſages of poetry and muſic of different ſtyles and maſters, and ſing them to the cithara. Cleomenes the rhapſodiſt, however, according to Athenæus, ſung by memory at the Olympic games an entire poem, called the expiations, compoſed by Empedocles. See RHAPSODIST.

As a further proof of muſical conteſts forming a part of the Olympic games, we ſhall only obſerve that the emperor Nero, who regarded every great muſician as his rival, diſputed the prize in muſic there, in all its forms: firſt, entering his name with the common candidates, and ſubmitting to all the uſual preparatory diſcipline, as well as to the rigour of the theatrical laws, during performance; and, afterwards, ſupplicating the favour of the nomodictai, or umpires, by all the ſeeming ſubmiſſion and anxiety of a profeſſed muſician; as if an emperor, and ſuch an emperor, had any thing to fear from the ſeverity of his judges.

The victors in every ſpecies of combat were diſtinguiſhed upon all occaſions, and had every where the moſt honourable reception: poets and muſicians of the greateſt eminence were ambitious of celebrating their praiſe; and it is to their triumphs that we owe the odes of Pindar. Other panegyrics of this kind have not come down to us, though every ſucceſsful hero had a bard to record his victory, and to chant his virtues. Both Simonides and Bacchylides compoſed hymns in honour of king Hiero, as well as Pindar; but we ſhall give ſufficient teſtimony hereafter of innumerable compoſitions of the like ſpecies having been produced, and ſung upon ſimilar occaſions, by the greateſt poets and muſicians of antiquity.

The *Pythic games*, Pauſanias informs us, conſiſted, in ancient times, of the poetical and muſical conteſts, and the prize was given to him who had written and ſung the beſt hymn in honour of Apollo. At their firſt celebration, Chryſothemis of Crete, the ſon of Carmanor, who purified Apollo, after he had killed the Python, was victor. After him Philammon, the ſon of Chryſothemis, won the prize; and the next who was crowned, was Thamyris, the ſon of Philammon. Eleutherus is recorded to have gained the prize there by the power and ſweetneſs of his voice; though the hymn which he ſung was the compoſition of another. It is ſaid, likewiſe, that Heſiod was refuſed admiſſion among the candidates, on account of his not having been able to accompany himſelf upon the lyre; and that Homer, though he went to Delphos to conſult the oracle, yet, on account of his blindneſs and infirmities, he made but little uſe of his talent of ſinging and playing upon the lyre at the ſame time.

Hence it appears, that though muſical conteſts were, perhaps, not ranked among the regular and eſtabliſhed exerciſes of the Olympic games, yet all antiquity agrees, that no others were admitted into the Pythic during the firſt ages of their celebration.

It was at the cloſe of the long and bloody war with the ſacrilegious Criſſæans, 591 years B.C. that Eurylochus, the general of the Amphictyons, who from his valour, and the length of the ſiege of Criſſa, was called the New Achilles, inſtituted the ſeveral kinds of Pythic combats at Delphos, which were afterwards conſtantly repeated on the ſecond year of each Olympiad.

Pauſanias, in his enumeration of the muſical conteſts that were added to the ancient Pythic games, at the cloſe of the Criſſæan war, tells us, that the Amphictyons propoſed prizes, not only for thoſe muſicians who ſung beſt to the accompaniment of the cithara, the only combat at the firſt inſtitution of theſe games, but others, both to ſuch as ſhould ſing beſt to the accompaniment of the flute, and to thoſe who, with the greateſt preciſion and taſte, played on that inſtrument alone, without ſinging. Here began the ſeparation of muſic and poetry. All the trials of ſkill, all the performances at banquets, feſtivals, and ſacrifices, had hitherto been confined to vocal muſic, accompanied by inſtruments indeed, but where poetry had an important concern; at leaſt, no inſtrumental muſic, without vocal, ſince the conteſt between Apollo and Marſyas, is mentioned in ancient authors, before this time, except that of the trumpet; the lyre and flute having, in public exhibitions, been mere attendants on the voice, and on poetry.

This was ſoon after the time when Sacadas is recorded to have played his Pythic air on the flute at Delphos, which reconciled Apollo (or his prieſt) to that inſtrument; who, till then, was ſaid to have had it in abhorrence ever ſince the conteſt with Marſyas. This muſician was not crowned the firſt time he played at the Pythic games, but in the two ſubſequent Pythiads he obtained the prize, which furniſhes a proof that inſtrumental muſic, ſeparated from vocal, began now to be ſucceſsfully cultivated among the Greeks.

After this, the ſame games and combats were eſtabliſhed at Delphos as at Olympia. The Amphictyons retrenched the flute accompaniment, on account of that inſtrument being too plaintive, and fit only for lamentations and elegies, to which it was chiefly appropriated. A proof of this, ſays Pauſanias, is given in the offering which Echembrotus made to Hercules of a bronze tripod, with this inſcription:

"Echembrotus, the Arcadian, dedicated this tripod to Hercules, after obtaining the prize at the games of the Amphictyons, where he accompanied the elegies that were ſung in the aſſembly of the Greeks, with the flute."

At the eighth Pythiad, 559 years B. C. a crown was given to players upon ſtringed inſtruments, without ſinging, which was won by Agelaus of Tegea.

The

The prize given to the victors at the Pythic games conſiſted either of apples, conſecrated to Apollo, or, as Pindar informs us, of laurel crowns, which, according to Pauſanias, were peculiar to the Pythic games, in alluſion to Apollo's paſſion for Daphne.

Strabo, ſpeaking of the different kinds of conteſts eſtabliſhed by the Amphictyons, at the firſt Pythic games, after the Criſſæans were ſubdued, mentions a particular ſpecies of compoſition, which was ſung to the hymn in praiſe of Apollo, and accompanied by inſtruments. It was called the Pythian nome; and was a kind of long cantata, conſiſting of five parts, or movements, all alluding to the victory obtained by the god over the ſerpent Python. The firſt part was called the *Prelude*, or preparation for the fight; the ſecond, *the Onſet*, or beginning of the combat; the third, *the Heat of the Battle;* the fourth, *the Song of Victory*, or the inſults of Apollo over the ſerpent Python, compoſed of iambics and dactyls; and the fifth, *the Hiſſing of the dying Monſter.*

This air, Pauſanias tells us, was compoſed, and firſt played at Delphos, by Sacadas, who, according to Plutarch, was an excellent poet as well as muſician, and author of lyric poems, of elegies, and of a compoſition conſiſting of three ſtrophes or couplets, performed ſucceſſively in the three modes chiefly uſed in his time, the Dorian, Phrygian, and Lydian; and this air was called trimeles, on account of its changes of modulation. Both Plutarch and Pauſanias mention his having been celebrated by Pindar; but as we are not in poſſeſſion of all that poet's works, this honourable teſtimony cannot be found at preſent. The reputation of Sacadas muſt doubtleſs have been very great, for Plutarch ſays, that his name was inſerted in the Pythic liſt of good poets; and Pauſanias, that he found his ſtatue, with a flute in his hand, on mount Helicon, and his tomb at Argos.

We are the more minute in ſpeaking of this perſonage, as he is the firſt upon record who detached muſic from poetry, and who, though a good poet himſelf, engaged the public attention in favour of mere inſtrumental muſic; a ſchiſm that has been as ſeverely cenſured as any one in the church. The cenſurers, however, have forgotten that ſuch ſchiſms, in the arts, are as much to be deſired, as thoſe of religion are to be avoided; ſince it is by ſuch ſeparations only that the different arts, and different branches of the ſame art, becoming the objects of ſeparate and excluſive cultivation, are brought to their laſt refinement and perfection.

After Sacadas had pointed out the road to fame, by means of inſtrumental muſic, it was ſo ſucceſsfully purſued by Pythocritus of Sicyon, whoſe ſtatue was erected at Olympia, that he gained the prize at Delphos, as a ſolo player on the flute, ſix different times.

After their regular celebration was eſtabliſhed, a catalogue of more than twenty of the moſt illuſtrious poets and muſicians of antiquity, who by the encouragement of the Pythic games brought muſic and poetry to the higheſt perfection in Greece, has been collected by ſir Iſaac Newton in his Chronology; theſe were Archilochus, Eumelus Corinthius, Polymneſtus, Thaletas, Xenodemus, Xenocritus, Sacadas, Steſichorus, Tyrtæus, Tleſilla, Rhianus, Alcman, Arion, Mimnermus, Alcæus, Sappho, Theognis, Anacreon, Ibycus, Simonides, Æſchylus, and Pindar.

At the *Nemean games*, though the exerciſes were nearly the ſame as at the Olympic, as we learn from the ſubjects of the Nemean odes of Pindar; yet that muſical performances uſually conſtituted a part of the exerciſes and amuſements at this ſolemnity, is a fact ſo fully aſcertained by a paſſage in Plutarch's life of Philopœmen, and corroborated by Pauſanias, that we ſhall give the narration entire, and leave it to ſpeak for itſelf.

"Philopœmen being elected a ſecond time general of the Achæans, ſoon after he had gained the celebrated battle of Mantinea, entered the theatre at the Nemean games, while the muſicians were diſputing the muſical prize. At the moment that Philopœmen entered, the muſician Pylades, of Megalopolis, happened to be ſinging to the lyre, the beginning of a ſong compoſed by Timotheus, called "the Perſians:"

"Behold the hero, from whoſe glorious deeds
Our greateſt bleſſing, liberty, proceeds!"

The ſubject of the verſe, the energy with which it was uttered, and the beauty of the ſinger's voice, ſtruck the whole aſſembly. They inſtantly caſt their eyes on Philopœmen, and, with the moſt violent applauſe and acclamation, animated with the hopes of recovering their former dignity, they aſſumed their ancient ſpirit and confidence of victory. Pauſanias adds, that they unanimouſly cried out, that nothing could be more applicable than this poem was to the brave general, who had undertaken to command their army."

At the *Iſthmian games*, the ſame trials of ſkill were exhibited as at the other three ſacred games, and particularly thoſe of poetry and muſic.

Livy relates a very intereſting event, which happened during the celebration of theſe games, after the Romans had defeated Philip king of Macedon, one of the ſucceſſors of Alexander the Great, who had been in poſſeſſion of the chief part of Greece.

The time, ſays this author, for celebrating the Iſthmian games was now come. There was always a great concourſe of people at them, from the natural curioſity of the Greeks, who delighted in ſeeing all kinds of combats and bodily exerciſes, as well as from the convenience of the ſituation, between two ſeas, for the inhabitants of different provinces to aſſemble. But being at this time anxious to know their own fate, and that of their country, all Greece flocked thither, the greater part ſilently foreboding the worſt, and ſome not ſcrupling openly to expreſs their fears. At length the Romans took their places at the games, and a herald, with a trumpet, in the uſual manner, advanced into the middle of the Arena, as if to pronounce the common form of words; but, when ſilence was ordered, he proclaimed, "that the Roman ſenate and people, and T. Quinctius Flamininus their general, after vanquiſhing Philip and his Macedonians, declared the Corinthians, Phocæans, all the Locrians, the iſland Eubœa, the Magneſians, Theſſalonians, Perrhæbi, Achæans, and Phthiotes, all which ſtates had been poſſeſſed by Philip, free, independent, and ſubject only to their own laws." The joy which this proclamation occaſioned in the aſſembly was, at firſt, too great to be expreſſed. The ſpectators could ſcarce credit what they heard; they regarded each other with aſtoniſhment, as if they had waked out of a dream. Each, diffident of his own ears, with reſpect to what particularly concerned himſelf and his own country, aſked his neighbour what had been ſaid. The herald was even called again, ſo ſtrong a deſire had they all, not only to hear, but to ſee the meſſenger of their liberty, and they had the ſatisfaction of hearing him repeat the decree. When their joy was fully confirmed, they expreſſed it in ſuch loud and reiterated ſhouts of applauſe, that it was evident liberty was dearer to them than all the other advantages of life. After this the games were celebrated, but with the greateſt hurry and confuſion; no one had eyes or attention for

for the ſpectacle; every avenue of inferior pleaſure was obſtructed by joy.

Theſe games, in which the victors were only rewarded with garlands of pine-leaves, were celebrated with great magnificence and ſplendor, as long as paganiſm continued to be the eſtabliſhed religion of Greece; nor were they omitted even when Corinth was ſacked and burned by Mummius, the Roman general, at which time the care of them was transferred to the Sicyonians, but was reſtored again to the inhabitants of Corinth, when that city was rebuilt.

Beſides the four games called ſacred, at which poets and muſicians contended for pre-eminence, there were many others of leſs celebrity, the principal of which, however, were the Panathenæan games in honour of Minerva, inſtituted by the Athenians, the moſt elegant, refined, and voluptuous, people of Greece.

There were two ſolemn feſtivals under this denomination at Athens, where prizes were eſtabliſhed for three different kinds of combat: the firſt conſiſted of foot and horſe races; the ſecond, of athletic exerciſes; and the third of poetical and muſical conteſts. Theſe laſt are ſaid to have been inſtituted by Pericles: and that great patron of arts and literature may have been the firſt who excited emulation in poets and muſicians, at this feſtival, by beſtowing rewards upon the moſt excellent; but, according to Plutarch, who had conſulted the Panathenæan regiſter, muſical performances were of much earlier date there than the time of Pericles. Rhapſodiſts were appointed to ſing the verſes of Homer at theſe games, by Hipparchus, the ſon of Piſiſtratus.

Singers of the firſt claſs, accompanied by performers on the flute and cithara, exerciſed their talents here upon ſubjects preſcribed by the directors of theſe exhibitions. And while the Athenian ſtate was free and independent, the noble and generous actions of Harmodius and Ariſtogiton, who had oppoſed the power of the Piſiſtratidæ, and of Ariſtobulus, who had delivered the Athenians from the oppreſſion of the thirty tyrants, impoſed upon them by the Lacedæmonians, were celebrated in theſe ſongs.

GAME is alſo uſed for all kinds of wild beaſts and birds fit for eating, and which are ſought after on that account.

Game includes wild beaſts of venery and chaſe; and alſo beaſts and fowls of warren.

Some authors divide game into *large*, which include red and fallow deer: and *ſmall*, to which belong hares, rabbits, pheaſants, and partridges.

A foreſt is a place ſet apart for preſerving, feeding, breeding, &c. all ſorts of game, and conſiſts of divers things, *viz.* ſoil, covert, laws, courts, judges, officers, game, and bounds. See FOREST.

A chaſe differs from a foreſt in this, among other things, that it has no variety of game. See CHASE.

Ways of catching game are by hunting, hawking, fowling, &c.

There are a great number of laws made for the ſecurity and preſervation of game. The reſtrictive laws relating to foreſts and game were introduced into Europe at the ſame time, and by the ſame people, as gave birth to the feudal ſyſtem: on the irruption of the northern barbarians, it behoved every conquering general, when he ſettled the economy of a vanquiſhed country, and partitioned it among his ſoldiers and feudatories, on condition of military ſervice, to keep the *ruſtici*, or natives of the country, who were not his military tenants, in as low a condition as poſſible, and eſpecially to prohibit them the uſe of arms. In order to this, it became neceſſary to prohibit hunting and ſporting, and that the conqueror ſhould reſerve this right to himſelf, and to ſuch capital feudatories, or barons, on whom he ſhould beſtow it. This excluſive privilege well ſuited the martial genius of thoſe conquering troops, who delighted in a ſport which bore reſemblance to war: and it is remarkable, that in thoſe nations where the feudal policy remains the moſt uncorrupted, the foreſt or game-laws continue in their greateſt rigour. In France all game was properly the king's: and in ſome parts of Germany it is death for a peaſant to be found hunting in the woods of the nobility. In the times of the Britons our whole iſland was repleniſhed with all ſorts of game, which they all enjoyed in common: but when huſbandry took place under the Saxon government, the beaſts fled into deſert tracts, called foreſts, which our royal ſportſmen reſerved for their own diverſion, on pain of a pecuniary forfeiture for ſuch as interfered with their ſovereign. But every freeholder had the full liberty of ſporting upon his own territories, provided that he abſtained from the king's foreſts; as is expreſſed in the laws of Canute and Edward the Confeſſor: "Sit quilibet homo dignus venatione ſua, in ſylva et in agris, ſibi propriis, et in dominio ſuo: et abſtineat omnis homo a venariis regiis, ubicunque pacem eis habere voluerit:" which indeed was the ancient law of the Scandinavian continent, from whence Canute probably derived it: "Cuique enim in proprio fundo quamlibet feram quoquo modo venari permiſſum." However, upon the Norman Conqueſt, a right of purſuing and taking all beaſts of chaſe, and other animals called game, was held to belong to the king, and to ſuch only as were authorized by him. This doctrine was founded, not only upon the principles of the feudal law, that the king is the ultimate proprietor of all the lands in the kingdom, being held of him as the chief lord, or lord paramount of the fen, and that he has therefore the right of the univerſal ſoil, to enter thereon and to take and chaſe ſuch creatures at his pleaſure; but alſo upon another maxim of the common law, that theſe animals are "bona vacantia," and, having no other owner, belong to the king by his prerogative. As the former reaſon was held to veſt in the king a *right* to purſue and take them any where; the latter was ſuppoſed to give the king, and ſuch as he ſhould authorize, a *ſole* and *excluſive* right. This right was exerted at and after the time of the Norman eſtabliſhment, with the utmoſt rigour. Blackſt. Com. vol. ii. p. 431, &c. See FOREST.

From this principle, that the ſole right of taking and deſtroying game belongs excluſively to the king, if it be admitted, it will follow, that no perſon, who does not derive his right from the crown, is by common law entitled to take or kill any beaſts of chaſe, or other game whatſoever. The principle now ſtated, "that the ſole property of all game is veſted in the king alone," has been rendered queſtionable by Mr. Chriſtian in his learned comment on Blackſtone's Commentary. Mr. Daniel, in his "Rural Sports," has alſo introduced ſeveral obſervations on the game laws, which tend to invalidate the general reaſoning of the learned judge upon this ſubject. The reaſons recited by Blackſtone for eſtabliſhing theſe conſtitutions are as follow: 1. "For the encouragement of agriculture and improvement of lands, by giving every man an excluſive dominion over his own ſoil;" but Mr. D. objects that it cannot eaſily be comprehended how, upon the author's principle, the reſtriction of a natural right to kill animals denominated game on his own grounds, or permiſſively on thoſe of another, and how the forbidding of a freeholder of leſs than 100*l.* a year, to kill a partridge upon his own eſtate, gives every man an excluſive dominion over his own ſoil. It is certainly not ſo obviouſly beneficial in this way as to promote the encouragement of agriculture, and the improvement of lands. Another reaſon is, 2. "For preſervation

of

of the ſeveral ſpecies of theſe animals, which would ſoon be extirpated by a general liberty." And again, 3. "For the prevention of idleneſs and diſſipation, in huſbandmen, artificers, and others of lower rank, which would be the unavoidable conſequence of univerſal licence." Theſe reaſons, it is alledged, deſtroy each other. It is plain, that without any reſtrictive laws, the evil would have cured itſelf; for if game would be extirpated by a general licence, it would follow of courſe that all idleneſs and diſſipation ariſing from this cauſe muſt end with the cauſe itſelf, and would require no law for its prevention. Another reaſon aſſigned in favour of the foreſt and game laws is, 4. "The prevention of popular inſurrections and reſiſtance to government, by diſarming the bulk of the people." But that the makers of theſe laws were actuated by this motive, is an opinion which the hiſtory and manners of the times will hardly allow us to admit. Hawks were at this time chiefly uſed to kill birds; and military weapons do not ſeem to have been much uſed in the purſuit of game. Beſides, the firſt qualifying ſtatute, 13 Ric. II. does not mention any inſtrument likely to be very ſerviceable in the hands of ſedition; nor was the government in thoſe days ſo extremely tender of the liberties of the people, as to take this indirect method of diſarming them, and of relieving itſelf from the apprehenſions of revolt. The habits, whatever they were, acquired in the purſuit of game, could not much contribute to initiate the peaſantry in the rudiments of military ſcience. Our author farther examines ſome of the principal early ſtatutes relating to game, and hence he infers that the right to purſue and deſtroy it, was at no time, by the conſtitutional law of this kingdom, held to be *ſolely* and *excluſively* in the ſovereign. It was clearly a *general* right, and did ſubſiſt as ſuch in *fact* and *uſage*, until upon principles of public expediency, it was judged fit to regulate and limit the enjoyment of it. Previouſly to the enactment of any reſtrictive ſtatutes reſpecting it, it ſtood upon the baſis of the common law. Game belongs to the claſs of "feræ naturæ," and of theſe the learned commentator has himſelf affirmed, "that by the law of nature, every man, from the prince to the peaſant, has an *equal right* of purſuing and taking them to his own uſe." Now as every natural right is protected and confirmed by the common law, and forms a part of it, to allow that this is a *natural* and *common right*, and at the ſame time to affirm "that no perſon whatever, but he who has a *derivative right*, is, by the common law, entitled to take or kill any beaſt of chaſe or other game whatever," is utterly repugnant and contradictory. If to kill game be a *natural right* (as it is declared to be), and *equally common* to all the king's ſubjects, it follows that it cannot be the *ſole* and *excluſive prerogative* of the king. If, on the other hand, it is the *ſole* and *excluſive prerogative* of the crown, then it cannot be in its origin a *natural* and *common right*. Lord Coke ſays (1 Inſt. 142.) "the common law is ſometimes called right, *common right*, and common juſtice. Thus, *common law* and *common right* are convertible terms; and ſir William Blackſtone's poſitions controvert each other. The learned judge has alſo been charged with advancing a doctrine wholly unprecedented, and inconſiſtent with the ſtatute (22 and 23 Car. II. c. 25) when he aſſerts, that "the circumſtance of having 100*l. per annum*, and the reſt, are not properly *qualifications*, but *exemptions*." If the king has the *ſole* and *excluſive* prerogative to take and kill game, this prerogative is alike infringed by perſons deſtroying game, whatever be their condition or degree, and *he alone* muſt be the perſon injured by ſuch an unauthorized act; but in the above cited ſtatute we find the ſtealing, taking, and killing of game, by diſorderly perſons, declared to be not to the injury of *the king*, as invading his peculiar privilege, but to the prejudice of *noblemen*, *gentlemen*, and *lords* of *manors*, and *others*, *owners of warrens*. But what prejudice could ariſe to noblemen and gentlemen, if ſuch perſons had not any *right* to take or kill game? If they themſelves could not lawfully enjoy it, but ſtood merely in the condition of perſons *exempted* from *additional* penalties inflicted on ſuch diſorderly perſons as are the immediate objects of the act, how, with any ſort of truth or propriety, could it be affirmed of them, that they were the perſons whoſe property or whoſe privileges were violated or infringed? If we are to conſult the motives of the legiſlature and the policy of the ſtatute, thoſe motives and that policy unqueſtionably were, to preſerve the game to the perſons deſcribed in the preamble of the ſtatute, and to ſuperadd ſuch limitations to the general right to kill game as are therein particularly ſtated. It has been farther alleged, that there is a fallacy in one of the principal arguments which the learned commentator has adopted for enforcing his doctrine with reſpect to the game-laws. That the ſole right of taking and deſtroying game belongs excluſively to the king, appears, we are told, from this; that "he may grant to his ſubjects an excluſive right of taking them, which he could not do unleſs ſuch a right was firſt inherent in himſelf. But here the learned writer omits to diſtinguiſh between "the *grant of an original right*," and "the qualifying by certain reſtrictions a right *previouſly poſſeſſed*."

No admirer, it is ſaid, of a manly, liberal, well-regulated ſyſtem, of public freedom, will be forward to aſſert, that the laws for the preſervation of game do not require to be very thoroughly reviſed. They certainly depart more widely from the line of genuine political juſtice, and expoſe the humble unqualified claſſes of the community more to the hazard of puniſhment and the oppreſſion of power, than any rational advocate of *moral* equality can conſiſtently approve. Their penalties are alſo infinitely too ſevere. That the puniſhment of death ſhould in any caſe be inflicted on an act which in itſelf violates no rule of religion, juſtice, or morality, is a reflection from which the mind revolts with pain and horror. Where is the wrong to individuals that demands ſuch an atonement? Where is the injury to ſociety which requires ſuch an example? That the act of deſtroying game is not *malum in ſe* is evident; for if it were, the legiſlature could not licenſe it. Not only the want of true wiſdom, but the want of common juſtice in theſe ſtatutes, requires the moſt earneſt and attentive conſideration in thoſe who adminiſter in the government of the ſtate. "When the legiſlature ſhall turn its attention to the reviſion of our penal ſtatutes, thoſe which reſpect the preſervation of game will without doubt receive that ſhare of correction which they ſo much need. At preſent the civil penalties which they impoſe are inordinately ſevere and oppreſſive. That they ſhould originally have crept into our code, as they did, at a period when the rights of the ſubject, being neither greatly regarded nor well underſtood, were without much ceremony fettered with reſtrictions, is not ſurpriſing; but that they ſhould be ſuffered to reproach our ſtatute-book in an age when freedom, refined by ſcience, boaſts the enlargement of her empire; when the political and moral rights of all orders of men are ſubmitted to the teſt of reaſon and the touchſtone of philoſophy, and a "patriot ſovereign" ſanctions thoſe rights by his ſupport, and protects them by his power; that at ſuch a period the ſpirit of hardſhip and injuſtice ſhould diſplay itſelf ſo conſpicuouſly in this part of our penal ſyſtem, reflects a diſhonour on our conſtitution, from which its conſiderate admirers muſt moſt ardently wiſh it relieved."

In the preſent ſtate of the game laws, perſons exempted from the penalties which they inflict for killing game, are not only liable to actions of treſpaſs by the owners of the land, but alſo, if they kill game within the limits of any royal franchiſe, they are liable to the actions of ſuch who may have the right of chaſe or free warren therein. Upon the whole it appears, that the king, by his prerogative, and ſuch perſons as have, under his authority, the royal franchiſes of chaſe, park, free warren, or free fiſhery, are the only perſons who may acquire any property, however fugitive and tranſitory, in theſe animals, *feræ naturæ*, while living; which is ſaid to be veſted in them, *propter privilegium*. Moreover, ſuch perſons as may thus lawfully hunt, fiſh, or fowl, *ratione privilegii*, have only a qualified property in theſe animals; it not being abſolute or permanent, but laſting only ſo long as the creatures remain within the limits of ſuch reſpective franchiſe or liberty, and ceaſing the inſtant they voluntarily paſs out of it. Although no man can come upon another man's ground to kill game, without being liable to an action of treſpaſs; and though the common law allows of the hunting of foxes and badgers, being beaſts of prey, in another man's ground, becauſe the deſtroying of them is looked upon as a public benefit; yet in this caſe the digging and breaking of the ground to unearth them is held to be unlawful, and the owner of the ground may maintain an action of treſpaſs. It is held, however, that if a man ſtarts any game within his own grounds, and follows it into another's, and kills it there, the property remains in himſelf; and this is grounded on reaſon and natural juſtice; for the property conſiſts in the poſſeſſion, which poſſeſſion commences by the finding it in his own liberty, and is continued by the immediate purſuit. (11 Mod. 75. Puff. Q. N. l. 4. c. 6.) Thus, alſo, if a ſtranger ſtarts game in one man's chaſe or free warren, and hunts it into another's liberty, the property continues in the owner of the chaſe or warren; this property ariſing from privilege, and not being changed by the act of a mere ſtranger. (L. Raym. 251.) Or, if a man ſtarts game on another's private grounds, and kills it there, the property belongs to him in whoſe ground it was killed, becauſe it was alſo ſtarted there; this property ariſing *ratione ſoli*. (L. Raym ibid.) Whereas if, after being ſtarted there, it is killed in the grounds of a third perſon, the property belongs not to the owner of the firſt ground, becauſe the property is local; nor yet to the owner of the ſecond, becauſe it was not ſtarted in his ſoil; but it reſts in the perſons who ſtarted and killed it, though guilty of a treſpaſs againſt both the owners. (Farr. 18. L. Raym. ibid.)

As the ancient laws relating to game are ſtill in force, it is deemed neceſſary to ſtate, as conciſely as poſſible, the proviſions contained in them.

The firſt qualification relating to game was eſtabliſhed by 13 Ric. II. ſtat. 1. cap. 13. which enacted that no layman, who hath not lands or tenements of 40*s*. a year, nor clergyman without preferment of 10*l*. a year, ſhall keep any greyhound or other dog for hunting, nor uſe ferrets, nets, and other engines for deſtroying game, on pain of a year's impriſonment. See alſo 16 Geo. III. c. 30.

By a ſtatute in 33 Hen. VIII. cap. 6. it is enacted, that no perſon ſhoot with, nor keep in his houſe, any croſs-bow or ſtone-bow, hand-gun or hagbut, under the length of one yard, unleſs he have lands, tenements, annuities, or offices, of the yearly value of 100*l*. on pain of a forfeiture of 10*l*. for every offence: nor ſhall any perſon travel with a croſs-bow bent, or gun charged, or ſhoot within a quarter of a mile of a city or town, except at a dead mark, or in defence of his houſe, under the like forfeiture, to be divided between the king and the proſecutor. This act continues ſtill in force, though the object of it, which was the encouragement of the uſe of the long-bow, doth not now exiſt.

None under the degree of a baron ſhall ſhoot with any hand-gun, within a city or town, or ſhoot at any fowl whatever with hail-ſhot on the ſame forfeiture. (2 and 3 Edw. VI. c. 14.) This act was repealed by 6 and 7 Will c. 13.

Any perſon ſhooting in the night-time, or diſguiſe, ſhall be deemed a felon, if he deny; if he confeſs, he is fineable at the next general ſeſſions. (1 Hen. VII. cap. 7.) This ſtatute is ſuperſeded by the *Black Act*, 9 Geo. cap. 22. No perſon ſhall take any partridge or pheaſant by nets, &c. on the freehold of another perſon, without leave of the owner, under the penalty of 10*l*., half to him that ſues, and half to the owner of the ground. 11 Hen. VII. cap. 17.

No perſon ſhall keep any net, called deer-hays or buck-ſtalls, on pain of 10*l*. a month. (19 Hen. VII. cap. 11.) None ſhall break into an impaled park or incloſed ground and chaſe out and kill any deer, under the penalty of 10*l* to the party aggrieved, or treble damages and coſts, and finding ſureties for ſeven years. 5 Eliz. cap. 21. explained and amended by 3 Jac. cap. 13. and 7 Jac. cap. 13. If any perſon, of what eſtate or condition ſoever, ſhall take, kill, or deſtroy any pheaſants or partridges in the night-time, and be convicted thereof at the aſſizes, ſeſſions, or leet, he ſhall forfeit for every pheaſant 20*s*. and for every partridge 10*s*. half to him that ſhall ſue, and half to the lord of the manor. (23 Eliz. cap. 10). None ſhall kill or take pheaſants or partridges, with any net or engine, in the night-time, on forfeiture of 20*s*. for every pheaſant, and 10*s*. for every partridge, 33 Eliz. None ſhall hunt or hawk with ſpaniels in ſtanding corn, or before it be ſhocked, unleſs on his own ground, on the penalty of 40*s*. half to the king, and the other half to the proprietor of the ground.

He that is convicted of killing or taking a pheaſant, partridge, duck, heron, hare, or other game; or of taking and deſtroying the eggs of ſwans, pheaſants, or partridges; ſhall pay 20*s*. for every ſuch fowl, hare, &c. to the uſe of the poor. 1 Jac. I. cap. 27. This act, as far as it relates to hares, is repealed by 48 Geo III. cap. 93.

Every perſon convicted to have kept a greyhound, dog, or net, to kill or take deer, hare, pheaſant, or partridge, unleſs he have inheritance in his own right, or the right of his wife, of 10*l*. per annum, a leaſe for life of 30*l*. per annum, or be worth 200*l*. in goods, or be the ſon of a knight or lord, or the ſon and heir apparent of an eſquire, and be convicted thereof by confeſſion, on oath of two witneſſes before two juſtices, ſhall be committed to gaol for three months, unleſs he pay 20*s*. for the uſe aforeſaid, or after one month after his commitment become bound with two ſureties not to offend in like manner. This was the ſecond qualification by eſtate or degree for killing game. Nor ſhall any fell, or buy to ſell again, any deer, hare, pheaſant or partridge, on pain of 40*s*. for every deer, 10*s*. for every hare, and 20*s*. for every pheaſant or partridge, half to him that will ſue, and half to the poor. Id. ſtat. cap. 27.

The next qualification relates to deer and conies only: this forbids a perſon not having hereditaments of 40*l*. a year, or goods of 200*l*. value, from uſing any gun or bow to kill deer or conies, or from keeping nets or coney dogs, except he hath incloſed grounds, uſed for the keeping of deer or conies, in which the increaſe of the conies amounts to 40*s*. a year, or be a keeper or warrener, under the penalty of having his guns, nets, &c. liable to be taken away by any perſon having lands or hereditaments of 100*l*. a year in fee or for life. 3 Jac. I. cap. 13.

The lord of a manor, or one having inheritance of 40*l*. per annum, lives-eſtate of 80*l*. or goods worth 400*l*. or their ſervants licenſed by them, may take pheaſants or partridges

tridges within their own lands or precincts, in the day-time, between Michaelmas and Chriſtmas. 7 Jac. I. cap. 11.

Hawking of pheaſants and partridges betwixt the firſt of July and the laſt of Auguſt is prohibited, under the penalty of 40*s.* for every ſuch hawking, and 20*s.* for every pheaſant or partridge deſtroyed. 7 Jac. cap. 11.

They that kill or take away any red or fallow deer, without conſent of the owner, ſhall forfeit 20*l.* to be taken by diſtreſs; one half to the owner, and the other to the informer; or, for want of ſuch diſtreſs, ſhall ſuffer a year's impriſonment. 13 Car. II.

Lords of manors, or other royalties, not under the degree of eſquire, may commiſſion one or more game-keepers who may ſeize all guns, dogs, bows, &c. of perſons not having eſtates, in their own or wife's right of 100*l.* per annum freehold, or for term of life; or 150*l.* per annum leaſehold, for ninety-nine years or upwards; or not being ſons and heirs of eſquires, or other perſons of higher degree; or owners or keepers of a foreſt, park, chaſe, or warren; and deſtroy, or convert ſuch guns, &c. to the uſe of the lord, 22 and 23 Car. II. cap. 25. For this purpoſe it has been judged neceſſary to have a warrant from a juſtice of peace, after information and oath of the offence firſt made. This is the laſt general qualification for killing game, and that which is now moſt to be regarded.

If any enter a coney-warren, uſed and kept for the breeding or keeping of conies, though not incloſed, and chaſe or kill conies, he ſhall forfeit treble damages, and be impriſoned three months: and they that kill conies in the night time upon the borders of warrens, or grounds uſed for keeping conies, ſhall be amerced at the diſcretion of the juſtice of peace, and pay down for the uſe of the poor any ſum not exceeding 10*s.* Id. ſtat.

By 16 G. III. c. 30. (which repeals in whole or in part 9 former acts relating to the ſubject of deer-ſtealing); and by 42 G. III. c. 107. (which repeals the firſt act of the 16 G. III.) it is enacted as follows: If any perſon ſhall courſe or hunt, or ſhall take in any ſlip, nooſe, toyle, or ſnare, or ſhall kill, wound, or deſtroy, or ſhall ſhoot at, or otherwiſe attempt to kill, wound, or deſtroy, or ſhall carry away any red or fallow deer, in the incloſed part of any foreſt, chaſe, purlieu, or ancient walk, or in any incloſed park, paddock, wood, or other incloſed ground, where deer are, have been, or ſhall be uſually kept, without the conſent of the owner, or without being otherwiſe duly authorized; or ſhall be aiding, abetting, or aſſiſting, every perſon ſo offending ſhall be guilty of felony, and adjudged to be tranſported for ſeven years. And every perſon who ſhall commit any of the ſaid offences in the unincloſed part of any ſuch foreſt or other ground, or ſhall be abetting, ſhall for every ſuch offence forfeit 50*l.*: and if the offender ſhall be a keeper of, or intruſted with the cuſtody or care of ſuch deer, he ſhall forfeit double. The proviſions of the 16 G. III. c. 30. reſpecting the ſeizing and conviction of offenders, and the recovery and application of penalties, and the appeal, &c. are extended to the 42 G. III. c. 107. See DEER-*Stealers*.

In caſe any hare, partridge, pheaſant, fiſh, fowl, or other game ſhall be found in any offender's houſe, he ſhall forfeit a ſum not leſs than 5*s.* nor more than 20*s.* to be levied by diſtreſs, half to the informer, and half to the poor; or, in want thereof, he ſhall be committed to the houſe of correction for a ſpace of time not greater than a month, nor leſs than ten days. And if any perſon, not qualified by law, ſhall keep or uſe any bows, greyhounds, ſetting dogs, ferrets, tumblers, ſnares, &c. he ſhall be ſubject to the ſame penalties. 4 and 5 Will. cap. 23.

If any higler, chapman, carrier, inn-keeper, or victualler, ſhall have in his keeping any hare, pheaſant, partridge, heath game, or growſe, not put in his hands by a perſon qualified by law, he ſhall forfeit 5*l.* for every ſuch hare, &c. half to the informer, and half to the poor, to be levied by diſtreſs; or, for want thereof, he ſhall be ſent to the houſe of correction for three months for the firſt offence, and for every other offence four months. 5 Anne, cap. 14.

If any perſon, whether he be qualified or not, ſhall ſell, or expoſe to ſale any hare, pheaſant, partridge, moor, heath game, or growſe, he ſhall be liable to the ſame penalty. 28 Geo. II. cap. 12.

Perſons not qualified, keeping greyhounds, lurchers, ſetting-dog, or engines to deſtroy game; and game-keepers, who, under colour of office, kill and ſell game without their maſter's knowledge; are liable to the like penalty. 5 Anne, cap. 14.

No lord of the manor is to appoint more than one game-keeper, and his name to be entered with the clerk of the peace, who is to give a certificate thereof; otherwiſe he is liable to the penalties againſt higlers. And if any other game-keeper, whoſe name is not ſo entered, who ſhall not be otherwiſe qualified by the laws of this kingdom to kill game, ſhall kill, ſell, or expoſe to ſale any hare, pheaſant, partridge, moor, heath-game, or growſe, he ſhall, on conviction before one juſtice, and on the oath of one witneſs, be liable to the ſame penalty for the firſt offence, and for every other offence to be ſent to the houſe of correction for four months. 5 and 9 Anne, cap. 25.

If any hare, pheaſant, &c. be found in the poſſeſſion of a perſon not qualified, unleſs he be entitled to it by ſome perſon that is qualified, the ſame ſhall be adjudged an expoſing it to ſale. Perſons deſtroying a hare in the night ſhall incur the forfeiture of 5*l.* 9 Anne, c. 25. 28 G. II. c. 12.

Any juſtice of the peace, and lord within his manor, may take away ſuch hare, &c. found in the cuſtody of a perſon not qualified; and any perſon that ſhall deſtroy, ſell, or buy any hare, &c. and ſhall in three months diſcover any higler, carrier, victualler, &c. that hath bought or ſold, or offered to buy or ſell, or had in their poſſeſſion any hare, &c. ſhall be diſcharged of the penalty annexed to his own offence, and receive the ſame benefit as any other informer. 5 Anne, cap. 14.

No lord of a manor ſhall appoint a game-keeper with power to kill or deſtroy game, unleſs he be qualified by the laws of the realm, be truly a ſervant of ſuch lord, or be immediately employed to kill game for the ſole uſe of ſuch lord; nor ſhall any lord authorize a perſon not qualified to keep or uſe gun, greyhounds, &c. and ſuch perſon as ſhall be found offending in either of theſe points, ſhall, for every offence, forfeit 5*l.* (3 Geo. I. cap. 11. repealed by 48 Geo. III. cap. 93.) If any perſon enter a park, paddock, or other incloſed ground where deer are uſually kept, and wilfully wound or kill any red or fallow deer, he ſhall be tranſported to the plantations for ſeven years. 5 Geo. I. See BLACK *Act*. See alſo DEER-*Stealers*.

If any perſon ſhall by hays, tunnels, or other nets, drive and take any wild duck, teal, widgeon, or any other water-fowl, in any place of reſort for wild fowl in the moulting ſeaſon between June 1 and Oct. 1, yearly, he ſhall, on conviction, forfeit for every ſuch fowl 5*s.* half to the informer, and half to the poor, by diſtreſs, or be committed to the houſe of correction for a time not exceeding one month, nor leſs than fourteen days: and the nets ſhall be ſeized and deſtroyed in the preſence of the juſtice. (9 Anne, cap. 25. 10 Geo. II. cap. 32.) And perſons deſtroying the eggs of any duck, teal, or other water-fowl, from March 31 to June 30, ſhall be liable to a year's impriſonment, or forfeiture of one penny for every egg. 25 Hen. VIII. cap. 11.

No perſon ſhall, on any pretence whatſoever, take, kill, carry, ſell, buy, or have in his poſſeſſion or uſe, any partridge,

between Feb. 1 and Sept. 1 (39 G. III. c. 34.); or any pheaſant, between Feb. 1 and Oct. 1. yearly; on pain of forfeiting, on conviction by one witneſs in any of the courts of record at Weſtminſter, 5*l.* for every ſuch fowl, with full coſts. 2 Geo. III. cap. 19.

And if any perſon ſhall ſhoot at, kill, or take any dove-houſe, or pigeon, and be convicted by confeſſion, or oath of one witneſs, before one juſtice, where the offence was committed, or the party apprehended, he ſhall forfeit 20*s.* to the proſecutor, or be committed to gaol or the houſe of correction for a time not exceeding three calendar months, nor leſs than one. Id. ſtat.

If any perſon ſhall knowingly or wilfully kill, take, or deſtroy, or uſe any gun, dog, ſnare, net, or other engine, with intent to kill, take, or deſtroy any hare, pheaſant, partridge, moor game, or heath game, in the night between the hours of ſeven at night and ſix in the morning, from the 12th day of October to the 12th day of February; and between the hours of nine at night and four in the morning, from the 12th day of February to the 12th day of October; or in the day-time, upon a Sunday or Chriſtmas-day; he ſhall, on conviction by oath of one witneſs, before one juſtice, forfeit for the firſt offence a ſum not exceeding 20*l.* nor leſs than 10*l.*; for the ſecond offence not more than 30*l.* nor leſs than 20*l.*; and for the third and every ſubſequent offence 50*l.*; each penalty to be levied by diſtreſs, and to be paid half to the informer, and half to the poor. In caſe of refuſal of payment of the fine of 50*l.* the offender ſhall be committed to the houſe of correction for no leſs than ſix, nor more than twelve calendar months, unleſs ſuch penalty ſhould be ſooner paid; and the offender may be once publicly whipped, if the juſtices think proper. (13 Geo. III. cap. 80.) And, moreover, by 39 and 40 G. III. c. 50. idle and diſorderly perſons, to the number of two or more, who ſhall deſtroy any pheaſant or partridge in the night; or who ſhall be found in any paddock, foreſt, chaſe, &c. between 8 at night and 6 in the morning, from Oct. 1 to Feb. 1, or between 10 at night and 4 in the morning from Feb. 1 to Oct. 1, having any inſtrument for the purpoſe, and with the intent of taking or deſtroying any hare, black or red game, or any of their abettors, &c. ſhall be deemed rogues and vagabonds within the meaning of 17 Geo. II. c. 5.

No perſon ſhall take, deſtroy, carry, ſell, buy, or have in his poſſeſſion any heath fowl, called black game, between Dec. 10 and Aug. 20; nor any growſe, commonly called red game, between Dec. 10 and Aug. 12; nor any buſtard, between March 1 and Sept. 1, in any year, on pain of forfeiting for the firſt offence any ſum not exceeding 20*l.* nor leſs than 10*l.* and for the ſecond, and every ſubſequent offence, not exceeding 30*l.* nor leſs than 20*l.* half to the informer, and half to the poor. (13 Geo. III. cap. 55.) And perſons taking or killing in the New Foreſt any black game between Dec. 10 and Sept. 1, ſhall be liable to the ſame forfeiture. (43 Geo. III. c. 112.) See Fishing, Hawking, Herons, Swans, &c.

By 25 Geo. III. c. 50. every perſon who ſhall uſe any dog, gun, net, or other engine for the taking or deſtruction of game (not acting as a game-keeper) ſhall previouſly deliver in a paper or account in writing, containing his name and place of abode, to the clerk of the peace of the county where he ſhall reſide, and annually take out a certificate thereof, upon which ſhall be charged a ſtamp-duty of 2*l.* 2*s.*: and by 31 Geo. III. cap. 21. 1*l.* 1*s.* more—total 3*l.* 3*s.* Such certificate, iſſued by the clerk of the peace, and bearing date on the day of its being iſſued, ſhall continue in force until the 1ſt day of July next following its date, for which the clerk of the peace ſhall receive 1*s.* for his trouble. And if he ſhall iſſue any certificate otherwiſe than as above ſet forth, or neglect or refuſe to deliver it, he ſhall forfeit 20*l.*, and moreover be liable to pay the duty on ſuch certificate. And if any perſon ſhall uſe any greyhound, hound, pointer, &c. or any gun, net, or other engine, for the taking or deſtruction of any hare, pheaſant, partridge, black or red game, or any other game whatſoever, without having obtained ſuch certificate, he ſhall forfeit 20*l.* A perſon who has obtained a certificate may demand from a perſon uſing any dog, gun, net, or other engine, for the taking or deſtruction of game, an inſpection of his certificate; and if ſuch perſon refuſe to produce it, or to give in his chriſtian and ſurname, and the place of his reſidence, or give in a fictitious name or place of reſidence, he ſhall forfeit 50*l.* But ſuch certificate ſhall not authorize killing game at unlawful times, nor by unqualified perſons. Liſts of ſuch certificates ſhall on or before the 1ſt day of Auguſt in each year be tranſmitted by the clerks of the peace to the head-office of ſtamps; and in every caſe of failure or error they ſhall forfeit 20*l.* Such liſt ſhall be kept at the ſaid office for inſpection; and the commiſſioners ſhall cauſe the ſame to be inſerted in the news-papers circulating in each reſpective county, or in ſuch public news-paper as to them ſhall ſeem moſt proper. Appeals may be made to the next ſeſſions. By 48 Geo. III. c. 55. on every perſon, who ſhall uſe any dog, gun, net, or other engine, for the purpoſe of taking or killing any game whatever, or any woodcock, ſnipe, quail, or landrail, or any conies, if ſuch perſon be a ſervant to any perſon thereby charged in reſpect of ſuch ſervant to the duties granted on ſervants by this act, ſhall be charged the annual ſum of 1*l.* 1*s.*; and if ſuch perſon be not a ſervant, 3*l.* 3*s.*; and upon every other perſon ſhall be charged the annual ſum of 3*l.* 3*s.*

Game, *Black*. See Grouse.

Game-*cock*. See Cock.

Game, *Red*. See Gor-*cock*.

Game, *White*. See Ptarmigan.

Game-*keeper*, is one who has the care of keeping and preſerving the game, being appointed thereto by the lord of a manor. See Game.

By 25 Geo. III. cap. 5. every deputation of a game-keeper ſhall be regiſtered with the clerk of the peace of the county where the manor ſhall lie, and ſuch game-keeper ſhall take out a certificate thereof annually, upon which ſhall be charged a ſtamp-duty of 10*s.* 6*d.*: and by 31 Geo. III. cap. 21. 10*s.* 6*d.* more—total 1*l.* 1*s.* By 48 Geo. III. cap. 149. the annual duty for the deputation of a game-keeper is 1*l.* 10*s.* A game-keeper, who, having obtained a deputation, ſhall for 20 days afterwards refuſe or neglect to regiſter the ſame, and take out a certificate, ſhall forfeit 20*l.* But no ſuch deputation and certificate ſhall authorize any ſuch game-keeper to take or deſtroy game out of the limits of the manor for which ſuch deputation was given. Such game-keeper muſt be a ſervant of the lord of the manor who appoints him, or be immediately employed for him. A perſon not thus qualified is liable to a forfeiture of 5*l.* if under colour of a deputation, &c. he take and kill any hare, pheaſant, partridge, or other game, or keep or uſe any greyhound, &c. ſetting dogs, hays, lurchers, guns or any other engine to kill the game.

GAMELIA, Γαμήλια, a nuptial feaſt, or rather ſacrifice, held in the ancient Greek families on the day before a marriage. It was thus called from γάμος, *marriage*; whence alſo Γαμηλίος, an epithet, or ſurname, given to Jupiter and Juno, conſidered as preſiding over marriages.

GAMELION, Γαμηλιων, in *Ancient Chronology*, the eighth month of the Athenian year. It contained twenty-nine days,

and anſwered to the latter part of our January, and the beginning of February.

This month had its name from being ſacred to Jupiter and Juno, diſtinguiſhed by the epithet Γαμηλιος, becauſe they preſided over marriages.

GAMELION, or *Gamelium*, a poem, or compoſition in verſe, on the ſubject of a marriage; more uſually called an epithalamium.

GAMELORA, in *Geography*, a ſmall iſland in the Mediterranean, near the N.E. coaſt of Tunis; 3 miles E. of cape Zibeeb.

GAMELSBACH, a town of Germany, in the county of Erbach; 7 miles E. of Erbach.

GAMESFIELD, a town of Franconia; 5 miles S.W. of Rothenburg.

GAMET, or *Old Mendoe*, a ſmall iſland in the North ſea, belonging to Denmark, 3 miles from the continent. N. lat. 55 20'. E. long. 8 30'.

GAMETRIA. See GEMATRIA.

GAMGO, in *Geography*, a river of Africa, which runs into the Coanza, 15 miles S. E. of Meopongo.

GAMING, the art or act of performing or practiſing a game, particularly a game of hazard.

All public gaming is ſeverely prohibited; and what money is thus loſt, is recoverable again by law.

In China, gaming is equally prohibited among the common people and the mandarins; and yet this does not hinder their playing and frequently loſing all they have; their lands, houſes, children, and even wives, which are all ſometimes laid on a ſingle card. F. le Compte.

In gaming, as judge Blackſtone very pointedly obſerves, the ſeveral parties engaged caſt lots to determine upon whom the ruin ſhall at preſent fall, that the reſt may be ſaved a little longer. Taken in any light, this is an offence of the moſt alarming nature; tending by neceſſary conſequence to promote public idleneſs, theft, and debauchery among thoſe of a lower claſs; and, among perſons of a ſuperior rank, it hath frequently been attended with the ſudden ruin and deſolation of ancient and opulent families, an abandoned proſtitution of every principle of honour and virtue, and too often hath ended in ſelf-murder. To this paſſion every valuable conſideration has been made a ſacrifice; and it is a paſſion which has lamentably prevailed in our own country, and which we ſeem to have derived from our anceſtors the ancient Germans; who, according to the account given of them by Tacitus (De Mor. Germ. c. 24.), were bewitched with the ſpirit of play to a moſt exorbitant degree. "They addict themſelves, ſays he, to dice (which is wonderful) when ſober, and as a ſerious employment; with ſuch a mad deſire of winning or loſing, that, when ſtripped of every thing elſe, they will ſtake at laſt their liberty, and their very ſelves. The loſer gives into a voluntary ſlavery, and, though younger and ſtronger than his antagoniſt, ſuffers himſelf to be bound and ſold. And this perſeverance in ſo bad a cauſe they call the point of honour; "ea eſt in re prava pervicacia, ipſi fidem vocant." One would think, ſays the learned judge now cited, that Tacitus was deſcribing a modern Engliſhman. Againſt a ſpirit ſo frantic, laws can be of little avail; becauſe the ſame falſe ſenſe of honour, that prompts a man to ſacrifice himſelf, will deter him from appealing to the magiſtrate. Yet it is proper that reſtricting and puniſhing laws ſhould be enacted, and that they ſhould be publicly announced and repeatedly inculcated, if poſſible to preſerve the unwary, if not to reclaim thoſe who are on the brink of ruin. Accordingly we ſhall here recite ſome of the principal ſtatutes which the wiſdom of the legiſlature has formed with a view of preventing this evil.

By 16 Car. II. cap. 7. if any perſon by playing or betting ſhall loſe more than 100*l.* at one time, he ſhall not be compellable to pay the ſame; and the winner ſhall forfeit treble the value, one moiety to the king, and the other moiety to him that ſhall ſue for it, with treble coſts. By 9 Anne, cap. 14. 18 Geo. II. cap. 34. all notes, bills, bonds, judgments, mortgages, or other ſecurities, given for money won by playing at cards, dice, tables, tennis, bowls, or other games, or by betting on the ſides of ſuch as play at any of thoſe games, or for repayment of any money knowingly lent for ſuch gaming or betting, ſhall be void: and where lands are granted by ſuch mortgages or ſecurities, they ſhall go to the next perſon who ought to have the ſame, as if the granter were actually dead, and the grants had been made to the perſon ſo intitled, after the death of the perſon ſo incumbering the ſame. If any perſon playing at cards, dice, or other game, or betting, ſhall loſe the value of 10*l.* at one time, to one or more perſons, and ſhall pay the money, he may recover the money loſt by action of debt within three months afterward: and if the loſer does not ſue, any other perſon may do it and recover the ſame, and treble the value with coſts, one moiety to the proſecutor, and the other to the poor; and the perſon proſecuted ſhall anſwer upon oath, on preferring a bill in equity to diſcover what ſums he hath won. And in any of theſe ſuits no privilege of parliament ſhall be allowed.

Perſons by fraud or ill practice, in playing at cards, dice, or by bearing a ſhare in the ſtakes, &c. or by betting, winning any ſum above 10*l.* ſhall forfeit five times the value of the thing won, and ſuffer ſuch infamy and corporal puniſhment as in caſes of wilful perjury, being convicted thereof on indictment or information; and the penalty ſhall be recovered by action, by ſuch perſon as will ſue for the ſame; and if any one ſhall aſſault and beat or challenge to fight any other perſon, on account of money won by gaming, upon conviction thereof by indictment or information, he ſhall forfeit all his goods, and ſuffer impriſonment for two years. (Stat. 9 Anne.) Alſo by this ſtatute, any two or more juſtices of the peace may cauſe ſuch perſons to be brought before them, as they ſuſpect to have no viſible eſtates, profeſſions, &c. to maintain them; and if they do not make it appear, that the principal part of their expences is got by other means than gaming, the juſtices ſhall require ſecurities for their good behaviour for a twelvemonth, and in default of ſuch ſecurity, commit them to priſon until they find it: and playing or betting during the time, to the value of 20*s.* ſhall be deemed a breach of good behaviour, and a forfeiture of the recognizance. Ibid.

This ſtatute of Anne is farther enforced by ſtat. 18 Geo. II. cap. 34, and ſome deficiencies are ſupplied; the forfeitures of that act may now be recovered in a court of equity: and, moreover, if any man be convicted, upon information or indictment, of winning or loſing at any ſitting 10*l.* or 20*l.* within twenty-four hours, he ſhall be liable to be indicted for ſuch offence in ſix months, either in the king's bench or at the aſſiſes; and being convicted ſhall forfeit five times the ſum won or loſt, which, deducting the charges, ſhall go to the poor. And if any offender ſhall diſcover another offender, the diſcoverer ſhall be diſcharged from all penalties by reaſon of ſuch offence, if not before convicted thereof, and ſhall be admitted as an evidence to prove the ſame. (9 Ann. c. 14.) By ſeveral ſtatutes of the reign of king George II. *viz.* 12 Geo. II. cap. 28. 13 Geo. II. cap 19. and 18 Geo. II. cap. 34. all private lotteries by tickets, cards, or dice, and particularly the games of faro, baſſet, ace of hearts, hazard, paſſage, roly poly, and all other games with dice, except backgammon, are prohibited

hibited under a penalty of 200*l.* for him that ſhall erect ſuch lotteries, &c. and 50*l.* a time for the players. Public lotteries, unleſs by authority of parliament, and all manner of ingenious devices, under the denomination of ſales or otherwiſe, which in the end are equivalent to lotteries, were before prohibited by a great variety of ſtatutes, under heavy pecuniary penalties. 10 and 11 Will. III. cap. 17. 9 Anne, cap. 6. § 56. 10 Anne, cap. 26. § 109. 8 Geo. I. cap. 2. § 36, 37. 9 Geo. I. cap. 19. § 4, 5. 6 Geo. II. cap. 35. § 29, 30.

By 10 and 11 W. c. 17. all lotteries are declared to be public nuiſances; and all grants, patents, and licenſes, for ſuch lotteries, to be againſt law. Any perſon keeping or playing at a lottery ſhall forfeit 500*l.*, one-third to the king, one-third to the poor, and one-third with double coſts to him that ſhall ſue in the courts at Weſtminſter, and the offenders ſhall be proſecuted as common rogues. By 9 Anne, c. 6, any perſon who ſhall ſet up, or publiſh the ſetting up any ſuch unlawful lottery, with intent to have it drawn, ſhall forfeit 100*l.*, one-third to the king, one-third to the poor, and one-third with full coſts to him who ſhall ſue. By 10 Anne, c. 26, any perſon who ſhall keep any office for making inſurances on marriage, births, chriſtenings, or ſervices, or any other office or place under the denominations of ſales, of gloves, fans, &c. for the improvement of ſmall ſums of money, ſhall forfeit 500*l.*, one-third to the king, one-third to the poor, and one-third with full coſts to him who ſhall ſue; and every printer, or other perſon, who ſhall publiſh the ſetting up or keeping of any ſuch office or place, ſhall forfeit 100*l.* in like manner. By 8 Geo. II. c. 2. any perſon who ſhall keep any office or place, under the denomination of ſales of houſes, lands, preſentations to livings, advowſons, plate, jewels, ſhips, goods, &c. for the improvement of ſmall ſums of money; or expoſe to ſale the ſame by way of lottery, or by lots, &c. or publiſh ſchemes for advancing ſmall ſums of money by ſeveral perſons, amounting to large ſums, to be divided among them by the chances of prizes in a public lottery; or ſhall deliver out tickets, entitling them to a ſhare of the money ſo advanced; or ſhall print or publiſh any ſuch ſcheme under any denomination whatever; and ſhall be convicted, on oath of one witneſs, by two juſtices;—ſuch perſon ſhall, over and above any penalties by any former act made againſt private lotteries, forfeit 500*l.*, one-third to the king, one-third to the informer, and one-third to the poor, to be levied by diſtreſs and ſale by warrant of ſuch juſtices, and be by them committed to the county-gaol for one year, and from thence till the ſaid ſum of 500*l.* be paid; and every adventurer in ſuch ſchemes ſhall forfeit double the ſum contributed, with coſts, half to the king, and half to him who ſhall ſue: and by 12 Geo. II. c. 28, ſuch perſon ſhall forfeit 200*l.* Such ſale depending upon any ſhares or lot ſhall be void; and every adventurer ſhall forfeit 50*l.* Any perſon may be ſummoned as a witneſs, notwithſtanding his having played; and in caſe of refuſal to appear, he ſhall forfeit 50*l.*, or be committed to gaol for ſix months, 18 Geo. II. c. 34. By 27 Geo. III. c. 1. all perſons who ſhall deal in lottery tickets or ſhares, without being licenſed, ſhall be deemed rogues and vagabonds within the meaning of the 17 Geo. II. c. 5. and be puniſhed accordingly. By 34 Geo. III. c. 40. on complaint upon oath before one juſtice of any offence committed againſt the act of 27 Geo. III. c. 1. for ſuppreſſing unlawful lotteries in any houſe or place within the juriſdiction of ſuch juſtice, whereby any offenders may be liable to be puniſhed as rogues and vagabonds, doors may be broke open to ſeize ſuch perſons. By 42 Geo. III. c. 119. all games or lotteries called "little-goes" are declared to be public nuiſances; and perſons keeping places for ſuch "little-goes," or other lottery, not authorized by parliament, ſhall forfeit 500*l.* for each offence; and every ſuch perſon ſhall be deemed a rogue and vagabond within 17 Geo. II. c. 5. And perſons employing others to carry on ſuch tranſactions ſhall be puniſhable as rogues and vagabonds. Magiſtrates may authorize perſons to break open doors and ſeize offenders; and the penalty for obſtructing officers is fine, impriſonment, and public whipping at the diſcretion of the court. No perſon ſhall agree to pay money on any contingency in ſuch game or lottery, or publiſh any propoſal for the aforeſaid purpoſes, on pain of 100*l.* for each offence.

The ſtatute 13 Geo. II. c. 19. for preventing the multiplicity of horſe-races, another fund of gaming, directs, that no plates or matches under 50*l.* value ſhall be run, upon penalty of 200*l.* to be paid by the owner of each horſe running, and 100*l.* by ſuch as advertiſe the plate.

Gaming-houſes are public nuiſances, and may upon indictment be ſuppreſſed and fined. (1 Hawk. P. C. c. 8. 225.) Theſe are prohibited under ſevere penalties by ſeveral ſtatutes. No perſon ſhall for his gain or living, keep any common houſe or place of bowling, coyting, cloyſh, cayls, half-bowl, tennis, dicing-table, carding, or any unlawful game, on pain of 40*s.* a day; and every perſon frequenting ſuch houſes and play, and there playing, ſhall forfeit 6*s.* 8*d.* And juſtices of the peace, and the head officers of corporations, have power to enter places ſuſpected of unlawful gaming, and to arreſt and impriſon the keepers and players, till they give ſecurity to keep and reſort to ſuch houſes no longer; and ſuch officers are bound to make ſearch for ſuſpected houſes, weekly or monthly, under a forfeiture of 40*s.* a month. Farther, artificers, labourers, ſervants, &c. are prohibited to play at tables, dice, tennis, cards, bowls, &c. out of Chriſtmas, on pain of 20*s.* and in Chriſtmas only in the houſes or preſence of their maſters. 33 Hen. VIII. cap. 9. By 18 Geo. II. c. 34. no perſon ſhall keep any houſe or place for playing, or permit any perſon within ſuch houſe to play at any prohibited game, with cards or dice, under the penalties of 12 Geo. II. c. 28, above cited. Moreover, gaming in public-houſes is prohibited under a penalty to the keeper of the houſe, who knowingly ſuffers it, of 40*s.* for the firſt offence, and for every other offence 10*l.* by diſtreſs, three-fourths of which ſhall be to the poor, and one-fourth to the informer. And any journeyman, labourer, apprentice, or ſervant, who ſhall game in ſuch a houſe, ſhall forfeit, on conviction by confeſſion, or the oath of one witneſs, not more than 20*s.* nor leſs than 5*s.* at the pleaſure of the juſtice, or be committed to hard labour for a term not exceeding a month. (30 Geo. II. cap. 24.) And by 25 Geo. II. cap. 36. any houſe, or place kept for public dancing, muſic, or other entertainment, in London, or within twenty miles, (except places authorized by letters patent, or licence of the crown, or lord chamberlain,) without licence, granted at the preceding Michaelmas ſeſſions, and ſigned and ſealed by four juſtices in open court, and of which notice is given over the door or entrance of ſuch licenſed place in the following words, *viz.* "Licenſed purſuant to act of parliament of the 25th of king George the Second;" ſhall be deemed a diſorderly houſe or place, and the keeper thereof ſhall forfeit 100*l.* with full coſts. A conſtable, on notice given him in writing by any two inhabitants of the pariſh paying ſcot and lot, of any perſon keeping ſuch diſorderly houſe, and on their making oath to ſuch notice, and entering into a recognizance of 20*l.* each to produce evidence of the offence, ſhall enter into a recognizance of 30*l.* before a juſtice of the peace to proſecute ſuch perſon; and the juſtice ſhall iſſue his warrant for bringing the accuſed perſon before him,

him, and bind him over to appear at the next ſeſſions or aſſizes: if the conſtable neglect or refuſe to comply with ſuch notice, &c. he ſhall forfeit 20*l.* to each of the ſaid inhabitants; and the conſtable ſhall be allowed the reaſonable expences of the proſecution, to be paid by the overſeers of the poor; and on conviction of the offender, the overſeers ſhall pay 10*l.* to each of ſuch inhabitants, on pain of forfeiting double to the ſaid perſons.

Every ſpecies of gaming or gambling is ſtrictly forbidden in the Britiſh army; and occaſionally puniſhed with ſeverity.

The buſineſs of chance or hazard, on which the laws of gaming depend, is of mathematical conſideration; inaſmuch as it admits of more, and leſs. It is, or is ſuppoſed to be, an equality of chance, upon which the gameſters ſet out: this equality is to be broken in upon in the courſe of the game by the greater good fortune or addreſs of one of the parties, upon which he comes to have a better chance; ſo that his ſhare in the depoſit, or ſtakes, is now proportionably more or better than at firſt: this more or leſs is continually varying, and runs through all the ratios between equality and infinite difference; or from an infinitely little difference till it arrives at an infinitely great one, upon which the game is ended. The whole game, therefore, with reſpect to the event or iſſue thereof, is only a change of the quantity of each perſon's ſhare, or chance, or of the proportions their two ſhares bear to each other; which mathematics alone can meaſure.

Hence ſeveral authors have computed the variety of chance in ſeveral caſes and circumſtances that occur in gaming; for a detail of which, and the principles on which the calculations are founded, we refer to the article *Doctrine of* CHANCES. See alſo EXPECTATION and PROBABILITY.

GAMITES LAPIS, the *marriage ſtone*, a ſtone of a very ſingular kind deſcribed by Pliny, and ſome other of the ancients; he ſays it was of a white colour, and that it had in it the figure of two hands mutually infolding one another, which made it a ſymbol of that ſtate. We know nothing of any ſuch ſtone at preſent in the world; and it is eaſy to conjecture, that in Pliny's time either the ſtone muſt have been factitious, or elſe fancy muſt have been very far ſtretched to make the reſemblance.

GAMLING, in *Geography*, a river of Sileſia, which runs into the Oder, nine miles S. of Oderberg.

GAMLITZ, a town of the duchy of Stiria; 11 miles N.N.W. of Marburg.

GAMMA, or GAMMATA *Ferramenta*, an old inſtrument, uſed in *Surgery* for cauteriſing the hydrocele. It was ſhaped like the Greek letter Γ, and is mentioned by Paulus Ægineta.

GAMMACANOR, or GAMMADOUR, in *Geography*, a town of the iſland of Bachian, one of the Moluccas.

GAMMADIUM, a triangular veſtment uſed in the primitive church.

GAMMALAMENA, in *Geography*, a town of the iſland of Ternate, the uſual reſidence of the king.

GAMMARUS, in *Natural Hiſtory*, an extenſive genus of the cancri or crab tribe in the Fabrician ſyſtem, the antennæ of which are pedunculate and very ſimple. See article CANCER.

GAMME, *Fr. Gammut*, *Engl.* or *Gamma-ut*, is a title given to the muſical alphabet, or ſeries of ſounds uſed in practical melody and harmony, aſcending or deſcending in what the Greeks call the Diatonic genus, and the moderns the ſcale of Guido; that is, by tones and ſemitones.

Rouſſeau, who never ſaw the Micrologus of Guido, or any of that ingenious and celebrated monk's original writings, has given the cleareſt and beſt definition of this technical term (gammut) according to the generally received opinion.

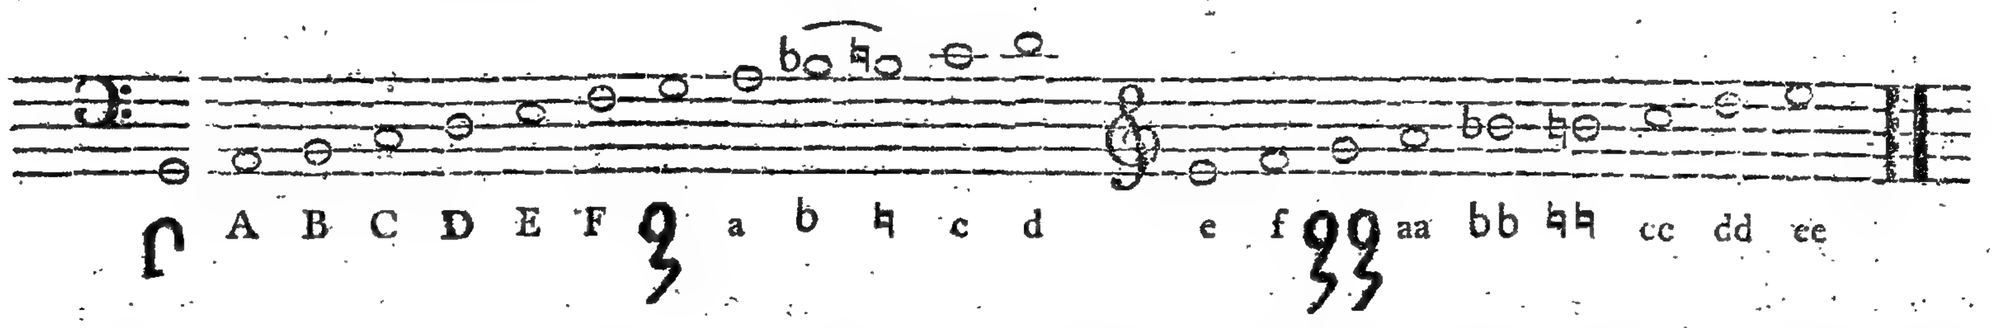
He ſays "the gammut is a table or ſcale invented by Guido d'Arezzo, by which muſical ſtudents learn to name and ſound correctly the intervals of the octave by the ſix ſyllables *ut*, *re*, *mi*, *fa*, *ſol*, *la*, according to all the arrangements that can be given them; which is called ſolmiſation," and which, like the changes on ſix bells, admit of 720 varieties.

The gammut has alſo been called *la mano armonica*, or the harmonic hand, from Guido having drawn the figure of a hand, upon the fingers of which he has arranged the notes, to ſhew the relation which the hexachords bear to the five tetrachords of the Greeks.

This hand appears in almoſt all the old muſical treatiſes in Latin and Italian, till the invention of *ſi* in France, for the ſeventh of the key of C, which has aboliſhed, in that kingdom, the mutations, and, conſequently, the harmonic hand, which taught them. See HARMONIC *Hand*.

Guido, according to the common opinion, having added a tetrachord in the acute to the diagram of the Greeks, and a ſound at the bottom, or rather, according to Meibomius, having by theſe additions reſtored the ancient diagram to its former extent, called this grave ſound (which anſwers to G on the firſt line in the baſe) *hypoproſlambanomenos*, and marked it by Γ, or gamma, the third letter of the Greek alphabet; and this letter being found at the beginning of the ſcale, for what reaſon does not clearly appear, gave birth to the barbarous name of gammut.

In the primitive ſtate of the gammut of Guido he expreſſed the ſounds by letters of the alphabet, without lines and ſpaces, or muſical characters for time; beginning with capitals for the firſt octave, minuſcules for the ſecond, and double letters for the third: as St. Gregory had done in naming the notes called Gregorian. In modern notation, the ſcale of Guido would have the following appearance, with the aſſiſtance of two different clefs, the baſe and the treble.



This gammut, in its whole compaſs, was compoſed of 20 ſounds or notes, that is, of two octaves and a major-ſixth.

As to the ſyllables for naming the notes in ſinging, invented by Guido (ſee SOLMISATION and HEXACHORDS), as he has provided only for ſix of the ſounds, it was neceſſary to make the ſame notes ſerve for different purpoſes, according to the progreſs of the melody; and theſe changes were called *mutations*; which ſee.

But as to the ſyllables *ut*, *re*, *mi*, *fa*, *ſol*, *la*, taken from a hymn

hymn to St. John the Baptiſt (ſee HYMN), they are only uſed in ſinging. See HEXACHORDS.

In conſulting the beſt elementary writers on muſic for a model of ſuch a gammut as could be underſtood without a maſter, or, at leaſt, be ſooneſt learned with his aſſiſtance, we were unable to find one that would not diſcourage an incipient ſtudent by its form and inſertion of the tenor clef.

The gammut which Graſſineau calls Guido's, and Rouſſeau the Italian gammut, is ſpread upon 10 lines and ſpaces, in ſuch a manner as a muſical ſtudent, far advanced, will never find in a muſic-book, and will perplex him as much as a firſt leſſon, or as it would a young arithmetician by giving him a ſum in the rule of three before he had learned addition.

We ſhall give the following elements on a plate in the order which long experience has found to be the moſt uſeful and eaſily comprehended in the firſt ſtages of practical muſic.

1. The regular ſeries of natural ſounds, from the bottom of the piano-forte to the top, that are compriſed within the ſtaff from gammut, or G on the firſt line in the baſe, to *g*, fifth ſpace in the treble, in the two moſt common and neceſſary clefs, the baſe and treble. See CLEFS.

2. The notes below and above the ſtaff, or regular lines.

3. Flats, ſharps, and naturals.

4. The time-table.

5. Characters of expreſſion; as the ſlur, different kinds of bowing.

6. Graces; as the ſhake, beat, and trill.

7. Tenor clefs, with the baritono clef, or baſe clef on the third line, and the French clef, or G clef on the firſt line.

In the biographical article aſſigned to Guido, we ſhall enter more at large into the hiſtory of the gammut, and inquire into the validity of the ingenious monk of Arezzo's claims to many other muſical inventions of which tradition has gratuitouſly made him a preſent. See GUIDO and MICROLOGUS.

GAMMER-LAMB. See GIMMER-*lamb*.

GAMMING, in *Geography*, a town of Auſtria; 10 miles E.S.E. of Bavarian Waidhofen.

GAMMING, *Markt*, a town of Auſtria; 10 miles E. of Bavarian Waidhofen.

GAMMO, a town of Africa, on the Ivory coaſt.

GAMMON, POINT, called formerly *Point Gilbert*, forms the eaſtern ſide of the harbour of Hyenis or Hyennes, in Barnſtable county, Maſſachuſetts.

GAMMONING, on *Ship-board*, are ſeveral turns of rope taken round the bowſprit, and reeved through holes in the knees of the head, for the greater ſecurity of the bowſprit.

GAMMUT. See GAMME.

GAMRY HEAD, on *Geography*, a cape of Scotland, on the N. coaſt of Bamffſhire, 6 miles E. of Bamff. N. lat. 57° 36'. W. long. 2° 20'.

GAN, a city of China, of the firſt rank, and metropolis of Se-tchuen. N. lat. 31° 16'. E. long. 103° 30'. Alſo, a city of China, of the ſecond rank, in the province of Pe-tcheli; 70 miles S.S.W. of Pekin. N. lat. 38° 54'. E. long. 115° 29'.

GANACHES, in the *Manege*, are the two bones, one on each ſide of the hinder part of the head, oppoſite to the neck, or onſet of the head, which form the lower jaw, and give it motion. It is in this place that the glands or kernels of the ſtrangles, and the glanders, are placed.

GANADO, in *Geography*, a town of Africa, in Bondou; 60 wiles W.S.W. of Fatteconda.

GANANOQUE, called alſo *Ganeno-coui*, a river of Upper Canada, which diſcharges itſelf into the river St. Laurence, in the townſhip of Leeds. In the mouth of the river there is an excellent harbour, the water in the channel being from 12 to 15 feet deep, and the current ſlow. This river was called the Thames before the diviſion of the province of Quebec.

GANARA, a country of Africa, in which is a town of the ſame name; ſituated on the banks of the Niger. The country is fertile and populous; the articles of its commerce are gold, ſenna, and ſlaves. N. lat. 12° 20'. E. long. 16°.

GANARASKA, a river of Upper Canada, by ſome called *Petueteſcoutiang*, which runs into lake Ontario on the N. ſide, eaſtward of Petit Eſcors, and W. of Pointe aux Chevaux. A carrying place of about 11 miles lies from the mouth of this river to the Rice lake, through a country well adapted for making a road.

GANAT, a town of Africa, in the country of Sahara, inhabited by the Tuerick; 200 miles S. of Mourzouk. N. lat. 24° 40'. E. long. 13° 56'.

GANAT-*ſur-Loire*, or *Gannat*, a town of France, and principal place of a diſtrict, in the department of the Allier, on the Loire; 15 miles N.E. of Moulins. The town contains 5043, and the canton 12,521 inhabitants, on a territory of 192½ kiliometres, in 12 communes.

GANCHE, *Fr.* derived from the Italian *ganus*, *hook*, a kind of gallows or gibbet uſed for the puniſhment of criminals in Turkey. The executioner raiſes the condemned by means of a pulley, and, ſuddenly ſlackening the rope, lets them fall on hooks of iron, which entangle and rend their bodies: in this condition they are left to die, and ſome have been known to languiſh for two or three days.

GAND, in *Geography*. See GHENT.

GANDAMUS, in *Ancient Geography*, a town of Arabia Felix, upon the Red ſea. Pomp. Mela.

GANDARA, a town of India, in the country called Gandarica by Steph. Byz.; different from the Gandarides of Pliny and Ptolemy, near the mouth of the Ganges.

GANDARUSSA, or GANDEROSA, in *Botany*, the Malay name of a ſpecies of *Juſticia*, *J. Gandaruſſa*, Linn. Suppl. 85, under which that plant is much celebrated in the popular ſongs of Java.

GANDASULL, GANDASULIUM, Rumph. Amb. v. 5. 175. t. 69. f. 3. See HEDYCHIUM *Coronarium*.

GANDE, in *Geography*, a river of Germany, which runs into the Lune; four miles W.S.W. of Ganderſheim.

GANDELI, a town of Italy; 20 miles N.E. of Bergamo.

GANDERSHEIM, a town of Germany, in the principality of Wolfenbuttel, ſituated on the river Gande, and having a celebrated abbey of Proteſtants, under the direction of an abbeſs, who is a princeſs, and four ladies of noble families; 33 miles S.W. of Brunſwick. N. lat. 51° 51'. E. long. 10° 1'.

GANDEUSEN, a town of Algiers; 40 miles W.S.W. of Tubnah.

GANDGOURLY, a town of Hindooſtan, in Golconda, at the union of the Manzorah and Godavery; 40 miles N.W. of Indelovoy.

GANDHAR, a town of Hindooſtan, in the circar of Rantampour; 30 miles S.S.W. of Rantampour.

GANDJA, or GANGEA, a town of the principality of Georgia 5;

Georgia; 100 miles S.E. of Tefflis. N. lat. 41° 32'. E. long. 45 10'.

GANDIA, a walled ſea-port town of Spain, in the province of Valencia, half a league from the coaſt, between the mouth of the Xucar and Cape Martin, on the rivulet Alevi, 40 miles S.S.E. of the capital, in a fertile, delightful, and populous territory, almoſt ſurrounded by a ridge of low hills, and wholly cultivated, except a low marſhy tract towards the coaſt, which is often inundated. The ducal palace is a magnificent edifice. N. lat. 39°. W. long. 0° 19.

GANDICOTTA, a town and fortreſs of Hindooſtan, ſituated on the top of a lofty mountain, on the ſouth bank of the river Pennar, in the circar of Cuddapa. The road to it is narrow, and formed in the rock, by the ſide of a frightful precipice. Below is a ſmall plain, watered by a number of ſprings, in which the inhabitants cultivate rice and millet. Near it is a diamond mine, 33 miles N. W. of Cuddapa. N. lat. 44° 55'. E. long. 78 29'.

GANDINA, a town of Italy, in the department of the Adda and Oglio; 10 miles N. E. of Bergamo.

GANDOLA, a town of Italy, in the department of the Serio; eight miles N.W. of Bergamo.

GANDOVA, a river of Abyſſinia, which runs into the Tacazé, 60 miles S. of Dekin.

GANE, a town of Arabia Felix; 150 miles N. of Mocha.—Alſo, a city of Africa, and capital of a country, governed by a ſultan, ſubject to Houſſan, on the N. ſide of the Niger, near a lake. Hornemann call's it *Cano*; 600 miles E. of Tombuctoo. N. lat. 16° 10'. E. long. 12° 40'.

GANEGAM, a town of the iſland of Ceylon; 60 miles S. S. E. of Columbo.

GANET ISLANDS, a cluſter of ſmall iſlands, near the eaſt coaſt of Labrador. N. lat 54°. W. long. 56° 10'.

GANEYGON, a town of Hindooſtan, in Dowlatabad; 33 miles S. W. of Amednagur.

GANG, in the *Sea Language*, ſignifies a crew.

To man a boat is called, to *put a gang of men* (which is a company) into her; they are commonly called the *cockſwain's* gang, who have the charge of her.

GANG-*fiſh*, in *Ichthyology*, a name given by ſome authors to a ſmall fiſh caught in the German lakes, and ſent in pickle into many parts of the world. The more uſual name of this fiſh among writers is lavaretus. See SALMO *Lavaretus*.

GANG-*ladder*, in *Canals*, a frame anſwering the ſame purpoſe as a *Horſing-block*, which ſee.

GANGS-*men*, in *Canal-making*, is a term for ſmall companies of men who undertake the labour of digging, embanking, or puddling a canal, reſervoir, &c.

GANG-*ox*. See OX.

GANG-*waggons*, or trams, &c. are names for the carriages, whether conſtructed of iron or wood, which are uſed for the conveyance of goods on rail-ways or tram-roads. See CANAL, and RAIL-WAYS.

GANG-*water*. See WATER-*gang*.

GANG-*way*, in *Mining*, ſignifies a paſſage, audit, or gate through which the miners paſs underground; ſometimes theſe are laid with iron or with wooden rails, for the trams or gang-waggon wheels to move on, or are laid with round logs of wood acroſs, if the floor is ſoft and ſubject to ſwell, on which the corves ſlide, as they are dragged along to the ſhaft bottom by the miners, or by the mine aſſes or horſes.

GANG-*way* is applied to all the ſeveral entrances, ways, or paſſages, from one part of the ſhip to the other.

Whatſoever is put in any of theſe paſſages, is ſaid to be laid or put in the gang-way.

GANG-*way* alſo denotes that part of a ſhip's ſide, both within and without, by which the paſſengers enter and depart: it is for this purpoſe provided with a ſufficient number of ſteps, or *cleats*, nailed upon the ſhip's ſide, nearly as low as the ſurface of the water; and ſometimes furniſhed with a ladder, whoſe lower end projects from the ſhip's ſide, being ſecured in this poſition by iron braces.

GANGA, in *Ornithology*, a name given by Buffon to the TETRAO *Alchata*, which ſee.

GANGACOTTY, in *Geography*, a town of Thibet; 68 miles S. of Gangotri.

GANGALAGUTTA, a town of Hindooſtan, in the circar of Cuddapa; 34 miles N. of Combam.

GANGAMAR, a town of Thibet; 18 miles S. of Jhanſu-Jeung.

GANGAPATNAM, a town of Hindooſtan, in the Carnatic, at the mouth of the Pennar; 80 miles N. of Madras. N. lat. 14° 25'. E. long. 80° 12'.

GANGARIDÆ, in *Ancient Geography*, a people of India, near the mouth of the Ganges, to whom Ptolemy aſſigns a capital called Gangia Regia, on the other ſide of the river, placed by M. D'Anville in lat. 24° 50'. See GOUR.

GANGARONO, a ſmall iſland in the gulf of Venice. N. lat. 44° 12'. E. long. 15° 35'.

GANGART, in *Mining*, ſignifies the ſides or walls of the vein or working; for which alſo the terms ſkirts, vein-ſkirts, woughs, &c. are uſed, in different mineral diſtricts. See VEIN.

GANGELT, in *Geography*, a town of France, in the department of the Roer, 12 miles S. S. E. of Ruremond. N. lat. 50° 58'. E. long. 5 59'.

GANGES, a town of France, in the department of the Herault, and chief place of a canton, in the diſtrict of Montpellier, and 21 miles N. of it. The place contains 3622, and the canton 7339 inhabitants, on a territory of 157½ kilometres, in 10 communes.

GANGES, a river of Aſia, which in the language of Hindooſtan is called *Pudda*, or *Padda*; and it is alſo named *Burra Gonga*, or the Great river, and *Gonga*, the river, by way of eminence; and hence the European names of the river are derived. It has, not unaptly, been denominated the twin-ſiſter, or rival of the *Burrampooter* (which ſee), from the contiguity of their ſprings, and from their reſemblance to each other in length of courſe, in bulk till they approach the ſea, in the ſmoothneſs and colour of their waters, in the appearance of their borders and iſlands, and finally, in the height to which their floods riſe, with the periodical rains. The Ganges, as well as the Burrampooter, has its ſource in the vaſt mountains of Thibet; and theſe two rivers proceed in oppoſite directions. The former ſeeks the plains of Hindooſtan by the weſt, and purſues the early part of its courſe through rugged vallies and defiles, and ſeldom viſits the habitations of men. After wandering about 800 miles through theſe mountainous regions, it iſſues forth a deity to the ſuperſtitious, yet gladdened, inhabitant of Hindooſtan. From the fabulous account of its origin we learn, that it flows out of the foot of Beſchan (the ſame with Viſtnou, or the preſerving deity), whence, according to the Bramins, it has its name "Pudda;" ſignifying in the Shanſcrit language foot; and that in its courſe to the plains of Hindooſtan it paſſes through an immenſe rock, ſhaped like a cow's head. This river was unknown to Herodotus, as he does not mention it, though it became famous in a century afterwards. Major Rennell, in ſumming up the whole information, collected from the different accounts of the upper part of the courſe of the Ganges, obſerves, that the two branches of it, which ſpring from the weſtern ſide of mount Kentaiſſe, take their courſe weſtward, inclining conſiderably to the north for a courſe of about

300 miles, in direct diſtance; when meeting the great chain or ridge of mount Himmaleh, which extends from Cabul along the north of Hindooſtan, and through Thibet, the rivers are compelled to turn to the ſouth; in which courſe they unite their waters, and form what is properly termed the river Ganges. This great body of water now forces a paſſage *through* the ridge of mount Himmaleh, at the diſtance, poſſibly, of 100 miles below the place of its firſt approach to it, and, ſapping its very foundation, ruſhes through a cavern, and precipitates itſelf into a vaſt baſon, which it has worn in the rock, at the hither foot of the mountains. The Ganges thus appears, to incurious ſpectators, to derive its original ſprings from this chain of mountains; and the mind of ſuperſtition has given to the mouth of the cavern the form of the head of a cow; an animal held by the Hindoos in a degree of veneration, almoſt equal to that in which the ancient Egyptians held their god Apis. From this ſecond ſource, as it may be termed, of the Ganges, its courſe becomes more eaſtwardly than before, through the rugged country of Sirinagur, until at Hurdwar it finally eſcapes from the mountainous tract, in which it has wandered for about 800 Britiſh miles.

The true origin of the Ganges was explored, ſo lately as the year 1717, by perſons deputed by the emperor Camhi for this purpoſe; and after a journey of about 2.500 Britiſh miles from the head of the Ganges, they brought ſome of its water back with them to Pekin. Until the reſult of this expedition was known in Europe, it was believed, on the teſtimony of the Hindoos, that the ſprings of the Ganges were at the foot of mount Himmaleh, or Imaus.

At Hurdwar, or Hurdoar, in latitude 30°, it opens itſelf a paſſage through mount Suvalick, or Suva-luik, or the chain of mountains that borders on the level country, on the north of the province of Delhi; and after guſhing through this opening, it flows with a ſmooth navigable ſtream through delightful plains during the remainder of its courſe to the ſea, which is about 1350 miles, diffuſing plenty immediately by means of its living productions, and ſecondarily, by enriching the adjacent lands, and affording an eaſy means of tranſport for the productions of its borders. In a military view, it opens a communication between the different poſts, and ſerves as a military way through the country, renders unneceſſary the forming of magazines, and infinitely ſurpaſſes the celebrated inland navigation of North America, where the *carrying places* not only obſtruct the progreſs of an army, but enable the adverſary to determine his place and mode of attack with certainty.

The Ganges, in its courſe through the plains, receives 11 rivers, ſome of which are equal to the Rhine, and none ſmaller than the Thames, beſides as many others of leſſer note. To this vaſt influx of ſtreams it is owing, that the Ganges exceeds the Nile ſo much in point of magnitude, while the latter exceeds it by one-third in length of courſe. Indeed, the Ganges is, in this laſt reſpect, inferior to many of the northern rivers of Aſia; though Mr. Rennell thinks that it diſcharges as much or more water than any of them, becauſe thoſe rivers do not lie within the limits of the periodical rains.

The bed of the Ganges is very unequal with reſpect to width. From its firſt arrival in the plains at Hurdwar, to the conflux of the Jumnah, the firſt river of note that joins it, its bed is generally from a mile to a mile and a quarter wide, and, compared with the latter part of its courſe, tolerably ſtraight. Hence, downward, its courſe becomes more winding, and its bed wider, till, having ſucceſſively received the waters of the Gogra, Soane, and Gunduck, beſides many ſmaller ſtreams, its bed has attained its full width; although, during the remaining 600 miles of its courſe, it receives many other principal ſtreams. Within this ſpace it is, in the narroweſt parts of its bed, half a mile wide, and in the wideſt, three miles, even where no iſlands intervene. The ſtream within this bed is always either increaſing, or decreaſing, according to the ſeaſon. When at its loweſt, which happens in April, the principal channel varies from 400 yards to $1\frac{1}{4}$ mile; but is commonly about $\frac{3}{4}$ of a mile in width. This river is fordable in ſome places above the conflux of the Jumnah, but the navigation is never interrupted. Below that, the channel is of conſiderable depth; for the additional ſtreams bring a greater acceſſion of depth than width. At 500 miles from the ſea, the channel is 30 feet deep when the river is at its loweſt; and it continues, at leaſt, at this depth to the ſea, where the ſudden expanſion of the ſtream deprives it of the force neceſſary to ſweep away the bars of ſand and mud thrown acroſs it by the ſtrong ſoutherly winds; ſo that the principal branch of the Ganges cannot be entered by large veſſels. See DELTA *of the Ganges*, and HOOGLY *River*.

The general deſcent of the Ganges does not exceed four inches *per* mile; and the mean rate of its motion is leſs than three miles an hour, in the dry months. In the wet ſeaſon, and whilſt the waters are running off from the inundated lands, the current runs from five to ſix miles an hour, and in certain circumſtances and ſituations it runs ſeven or eight miles. Mr. Rennell mentions an inſtance, in which a boat was carried, againſt a ſtrong wind, 56 miles in eight hours. Conſidering that the velocity of the ſtream is three miles in one ſeaſon, and five or more in the other, on the ſame deſcent of four inches *per* mile; and that the motion of the inundation is only half a mile *per* hour, on a much greater deſcent, no farther proof is required, how ſmall the proportion of velocity is that is communicated by the deſcent. It is then, ſays Mr. Rennell, to the *impetus* originating at the ſpring-head, or at the place where adventitious waters are poured in, and ſucceſſively communicated to every part of the ſtream, that we are principally to attribute the velocity; which is greater or leſs according to the quantity of water poured in. The windings of the Ganges in the plains are, without doubt, owing to the looſeneſs of the ſoil; and major Rennell alleges as a proof of this, that they are perpetually changing; which thoſe, originally induced by an inequality of ſurface, can ſeldom or never do. Appearances, ſays this ingenious writer, favour very ſtrongly the opinion, that the Ganges had its former bed in the tract now occupied by the lakes and moraſſes, between Nattore and Jaffiergunge; ſtriking out of its preſent courſe at Bauleah, and paſſing by Pootyah. With an equal degree of probability (favoured by tradition), we may trace its ſuppoſed courſe by Dacca, to a junction with the Burrampooter, or Megna, near Fringybazar: where the accumulation of two ſuch mighty ſtreams probably ſcooped out the amazing bed of the Megna. For an account of the openings that form the mouths of the Ganges; ſee DELTA *of the Ganges*. The ſand and mud-banks at this time extend 20 miles off ſome of the iſlands, in the mouths of the Ganges and Burrampooter; and in many places riſe within a few feet of the ſurface. Some future generation will probably ſee theſe banks riſe above water, and ſucceeding ones poſſeſs and cultivate them. Of the iſlands formed in the channel of the Ganges, ſome are four or five miles in extent, which are formed at the angular turnings of the river, and were originally ſand-banks thrown up round the points, and afterwards inſulated by breaches of the river; and others are formed in the ſtraight parts of the river, and in the middle of the ſtream, owing their origin to ſome obſtruction lurking at the bottom, and rapidly accumulating. The river borrows on each ſide to ſupply

ſupply the deficiency in its bed; and in ſuch parts of the river ſteep banks occur on both ſides. Theſe are increaſed by many periodical floods, and at length acquire mould ſufficient for the purpoſes of cultivation. Whilſt the river is forming new iſlands in one part, it is ſweeping away old ones in other parts.

Mr. Rennell, in accounting for the annual ſwelling and overflowing of the Ganges, obſerves, that it owes its increaſe as much to the rain-water that falls in the mountains contiguous to its ſource, and to the ſources of the great northern rivers that fall into it, as to that which falls in the plains of Hindooſtan; the quantity of ſnow melted in the mountains contributing only in a ſmall proportion to its increaſe; for it riſes 15½ feet out of 32 (the ſum total of its riſing) by the latter end of June; and it is well known, that the rainy ſeaſon does not begin in moſt of the flat countries till about that time. In the mountains it begins early in April; and by the latter end of that month, when the rain-water has reached Bengal, the river begins to riſe but by very ſlow degrees; for the increaſe is only about an inch *per* day for the firſt fortnight. It then gradually augments to two or three inches before any quantity of rain falls in the flat countries; and when the rain becomes general, the increaſe, on a medium, is five inches *per* day. See BENGAL.

The following table ſhews the gradual increaſe of the Ganges and its branches, according to obſervations made at Jellinghy and Dacca.

	At Jellinghy.		At Dacca.	
	Ft.	Inch.	Ft.	Inch.
In May it roſe - -	6	0	2	4
June - - -	9	6	4	6
July - - -	12	6	5	6
In the firſt half of Auguſt	4	0	1	11
	32	0	14	3

The quantity of the daily decreaſe of the river is nearly in the following proportion: during the latter half of Auguſt, and the whole of September, from three to four inches; from September to the end of November, it gradually leſſens from three inches to 1½ inch; and from November to the latter end of April, it is only half an inch *per* day at a medium. Theſe proportions relate to ſuch parts of the river as are not affected by the tides. The following circumſtance is remarked by Mr. Rennell as attending the increaſe of the Ganges; *viz.* that there is a difference in the quantity of the increaſe in places more or leſs remote from the ſea, as exhibited in the preceding table. It is a fact, he ſays, confirmed by repeated experiments, that from about the place where the tide commences to the ſea, the height of the periodical increaſe diminiſhes gradually, until it totally diſappears at the point of confluence; and this is perfectly conformable to the known laws of fluids. The ocean preſerves the ſame level at all ſeaſons (under ſimilar circumſtances of tide), and neceſſarily influences the level of all the waters that communicate with it, unleſs precipitated in the form of a cataract. Could we ſuppoſe, for a moment, that the increaſed column of water, of 31 feet perpendicular, was continued all the way to the ſea by ſome preternatural agency; whenever that agency was removed, the head of the column would diffuſe itſelf over the ocean, and the remaining parts would follow, from as far back as the influence of the ocean extended; forming a ſlope, whoſe perpendicular height would be 31 feet. This preciſely correſponds to the fact. At the point of junction with the ſea, the height is the ſame in both ſeaſons at equal times of the tide. At Luckipour, there is a difference of about ſix feet between the heights in the different ſeaſons; at Dacca, and places adjacent, 14; and near Cuſtee, 31 feet. Here is a regular ſlope; for the diſtances between the places bear a proportion to the reſpective heights. This ſlope muſt add to the rapidity of the ſtream; for, ſuppoſing the deſcent to have been originally four inches *per* mile, this will increaſe it to about 5½. Cuſtee is about 240 miles from the ſea, by the courſe of the river; and the ſurface of the river there, during the dry ſeaſon, is about 80 feet above the level of the ſea at high-water. The tides in the river Amazons are perceptible at 600 miles above its mouth; but at an elevation of only 90 feet, according to M. De Condamine. Thus far does the ocean manifeſt its dominion in both ſeaſons; in the one by the ebbing and flowing of its tides; and in the other by depreſſing the periodical flood, till the ſurface of it coincides as nearly with its own, as the deſcent of the channel of the river will admit. Similar circumſtances take place in the Jellinghy, Hoogly, and Burrampooter rivers, and, as Mr. Rennell ſuppoſes, in all others that are ſubject to periodical or occaſional ſwellings. Not only is the flood diminiſhed near the ſea, but the river banks are diminiſhed in the ſame proportion; ſo that in the dry ſeaſon the height of the periodical flood may be known by that of the bank.

The quantity of water diſcharged by the Ganges, in one ſecond of time, during the dry ſeaſon, is 80,000 cubic feet; but in the place where the experiment was made, the river, when full, has thrice the volume of water in it; and its motion is alſo accelerated in the proportion of five to three; ſo that the quantity diſcharged in a ſecond at that ſeaſon is 405,000 cubic feet. If we take the medium the whole year through, it will be nearly 180,000 cubic feet in a ſecond. Rennell's Memoir. Phil. Tranſ. vol. lxxi.

GANGES, in *Ancient Geography*, *Mowil-Ganga*, a very large river in the iſland of Taprobana, according to Ptolemy. It deſcended from high mountains in the centre of the iſland, and diſcharged itſelf into a large bay ſituated about the middle of the eaſtern coaſt.

GANGES *Iſlands*, or *North Natunas*, in *Geography*, two ſmall iſlands between the iſland of Borneo and the gulf of Siam. N. lat. 4° 55′. E. long. 106° 45′.

GANGI, a town of Sicily, in the valley of Demona; 14 miles S. W. of Miſtretta.

GAN-GIN, a town of China, of the third rank, in Houquang; 36 miles E S.E. of Heng-tche.

GANGLION, (a primitive Greek word) denotes, in *Anatomy*, the ſmall ſwellings found in certain parts of the nervous ſyſtem. See the account *of the ſtructure of the nerves* in the article BRAIN. The particular ganglions are deſcribed in the article NERVE.

GANGLION, in *Surgery*, is a term applied to a kind of tumour which generally forms upon the tendinous, or ligamentous parts of the limbs. The ſwelling is very prominent, and circumſcribed, and is always connected with ſome tendon, or aponeuroſis underneath. The diſeaſe is generally unattended with pain, the only inconveniences being, more or leſs, deformity, and ſometimes ſenſation of weakneſs in the performance of ſome particular motion. However, it behoves every ſurgeon and patient to be aware that, though ganglions are for the moſt part not ſeriouſly troubleſome while free from ulceration, yet it ſometimes happens, that in conſequence of their being imprudently punctured, or otherwiſe irritated, they are converted into very dangerous fungous, and cancerous diſeaſes. (See Medical Journal, vol. v.) A ganglion is ſo much like an encyſted tumour of the meliceris kind, that many ſurgical writers have treated of ſuch diſeaſes under the ſame head.

The

The ganglion, indeed, is compoſed of a tendinous cyſt, which is filled with a fluid reſembling white-of-egg. The chief circumſtance in which it differs from a common encyſted tumour, is in having a cloſe attachment to ſome tendon or ligamentous expanſion underneath.

The parts moſt frequently attacked with ganglions are the hands and feet; but there are inſtances of theſe tumours making their appearance upon many other ſituations in the body. Mr. Warner met with an extraordinary example of this kind, where the tumour poſſeſſed the whole back part of the neck.

Ganglions ſometimes take their riſe from a ſtrain or bruiſe; and, at other times, they happen without any previous accident. It is not common for them to grow to a very large ſize; but on certain occaſions they have done ſo, and proved very inconvenient, by depriving the part of its ſtrength and motion.

Ganglions are unattended with any diſcolouration of the ſkin, and, on being compreſſed, appear to poſſeſs a great deal of elaſticity.

Theſe tumours admit of being cured in various ways, ſome of which are more certainly efficacious, and freer from objections than others. The chief means are friction, with ſtimulating diſcutient applications, ſetons, preſſure, ſtriking the tumour with ſome hard body, and exciſion.

With reſpect to ſtimulating diſcutient applications, they are uſed with a view of producing an abſorption of the ſwelling, an attempt which more frequently ſucceeds in this ſort of caſe than in any other kind of tumour, putting out of conſideration a few particular excreſcences of a warty nature. The moſt common diſcutient application for ganglions is the oleum origani, with which theſe ſwellings are to be rubbed two or three times a day. Mr. Warner found that ſaponaceous liniments, mixed with opium, and plaſters, compoſed of ſoap and mercury, had the greateſt power in diſperſing this deſcription of tumours, and that, in many inſtances, they fully anſwered his purpoſe. In other caſes, he obſerves, that camphorated mercurial ointment will be found ſucceſsful. Bliſtering the ſkin which covers a ganglion, and keeping up a diſcharge from the excoriated ſurface, by means of the ſavine ointment, is another plan of cure to be mentioned with topical diſcutients.

When an endeavour is to be made to effect the abſorption of a ganglion, we are of opinion that the moſt eligible method, generally ſpeaking, is to rub the tumour with the oleum origani, or one of the applications recommended above by Mr. Warner. We ſhould not be inclined to have recourſe to the bliſtering plan, except, perhaps, in a few obſtinate caſes.

Sometimes, by the foregoing meaſures, particularly when theſe are aſſiſted by conſtant preſſure on the tumour, a ganglion may be effectually removed. Very frequently, however, the ſwelling only undergoes a temporary diminution, and returns to its former magnitude ſhortly after the applications are diſcontinued.

Setons are a dangerous and painful means of cure, and we earneſtly recommend them never to be tried with a view of removing ganglions. We have already ſtated, that while a ganglion is free from irritation and ulceration, the complaint is by no means ſevere; but that when it has burſt, or been punctured, it ſometimes changes into a terrible and fatal diſeaſe. In the fifth volume of the London Medical Journal, we may find an impreſſive caſe, in which the fungus hæmatodes was produced by an attempt to cure a ganglion with a ſeton. Were we to ſuppoſe the plan ſucceſsful, ſtill it would be objectionable, on account of its neceſſarily ſubjecting the patient, for a certain time, to ſome conſiderable pain, as well as troubleſome ſores, while milder and more infallible methods might be choſen.

Keeping up a conſtant preſſure on a ganglion, by binding a piece of ſheet-lead upon the tumour, is a very eligible plan to be tried in the firſt inſtance, eſpecially when aided by occaſional frictions with ſome of the above-mentioned diſcutient remedies. Sometimes a complete cure is thus accompliſhed; ſometimes only a temporary diminution of the ſwelling; as the fluid ſoon accumulates again, in conſequence of the cavity of the cyſt not being obliterated by an adheſion of its oppoſite ſides to each other.

The next practice which we have to notice, is that of ſtriking a ganglion with the fiſt, a hammer, or the back of a book. We have heard of ſeveral inſtances in which the ſwelling has thus been very expeditiouſly and permanently cured. It ſeems probable that the blow ruptures the ſac, drives out the fluid into the ſurrounding cellular ſubſtance, and occaſions an inflammatory affection of the cyſt, ending in the obliteration of the cavity for the fluid. We have never adopted this method ourſelves, from an averſion to running any riſk of making the tumour inflame and ulcerate, and becauſe we have generally found ſucceſs attend frictions with liniments, oleum origani, or camphorated mercurial ointment, when aided by the preſſure of a piece of lead.

Inſtances, however, are not uncommon, in which all attempts to diſperſe a ganglion prove ineffectual. When this is the caſe, and the parts become diſabled from the ſize and ſituation of the ſwelling, the ſurgeon is warranted in extirpating the diſeaſe with a knife. The manner of doing this operation is very ſimilar to that of removing encyſted tumours. (See EXTIRPATION.) Some practitioners have been fearful of cutting away ganglions, from an idea, that unpleaſant ſymptoms would ariſe from wounding the ſubjacent tendon, or ligamentous expanſion. Such apprehenſion, however, ſeems to be ill-founded, as many caſes are related in ſurgical books of ganglions being removed with a knife with the utmoſt ſucceſs. It is not always neceſſary to injure, in any material degree, the ſubjacent tendon, the chief objects of the operator only being to cut the ſwelling from the ſurface underneath, to take out the cyſt entire, that is to ſay, without wounding it, or leaving any particle of it behind, and then to bring the edges of the wound together with ſticking plaſter. Some preſſure ſhould alſo be made on the part with a compreſs of lint and a bandage.

In order to ſhew that a ganglion may, in caſe of its reſiſting other plans, and becoming troubleſome, be ſafely cured by exciſion, we ſhall quote the following caſe. "A young woman, 19 years of age, ſtrained her wriſt by a fall. The accident was immediately followed by great pain, and a weakneſs and ſwelling of the whole hand. Notwithſtanding proper methods were tried for her relief, the injured part continued much in the ſame ſtate for four years. A ſmall diſtinct tumour was now diſcovered, ariſing from the inner and lower part of her wriſt, and, in a few days, the ſwelling became ſo large as to hinder the patient from ſhutting her hand, or moving her fingers. When the part was ſhewn to Mr. Warner, he felt in the tumour a fluid, which extended about an inch above the tranſverſe ligament of the wriſt, and about half an inch below it; and which upon preſſure ſeemed to paſs under the ligament. Mr. Warner undertook the cure by extirpation. He began an inciſion a little above the upper part of the ſwelling, and continued the cut through the integuments to a little beyond the lower part. He then diſſected up the ſkin on each ſide, and was thus enabled to ſee the exact ſituation of the tumour, which lay under the tendons of the flexor carpi ulnaris, and palmaris longus muſcles, both of which were conſiderably

ſiderably lifted up, and removed from their natural ſituation, by the ſubjacent tumour. The ganglion alſo extended under the tranſverſe ligament of the wriſt, which part it was neceſſary to divide, before the baſe of the tumour could be diſſected off. The lower part of the cyſt adhered to the tendons of the extenſor muſcles, from which the whole was ſeparated by means of the knife. In ſix weeks the patient got well, without any conſiderable inflammation or abſceſs, and regained the uſe of her hand." (See Warner's Caſes, p. 165.) Two other caſes are recorded by the ſame author of ganglions being ſucceſsfully cured by extirpation. Mr. Warner is candid enough to allow, that, in ſome inſtances, he had ſeen inflammations and abſceſſes follow the operation; but, he adds, that he never knew one caſe that did not terminate well.

Mr. Gooch, in the ſecond volume of his chirurgical works, relates a caſe which he alſo cured with the knife. P. 376.

Heiſter likewiſe ſtates, that he has ſeveral times cut away ganglions with ſucceſs.

Whenever a ganglion is unuſually large and troubleſome, and does not yield to preſſure and diſcutients, we ſhould generally recommend its removal with a knife.

If the caſe be in a ſtate of ulceration, the ſooner the operation is done the better, by reaſon of the danger of the diſeaſe now putting on a malignant character. While no ulcer exiſts, a ſimple longitudinal cut through the integuments ſuffices; but when the ſkin is ulcerated, and the tumour has burſt, the ſurgeon muſt begin his operation by making an oval or circular inciſion, which will take away all the diſeaſed part of the integuments.

Mr. Warner does not mention that he brought the lips of the wound together with ſticking-plaſter, or applied a compreſs; but when theſe things are attended to, we have no doubt that the generality of patients will be well in a much ſhorter ſpace of time than ſix weeks after the operation.

We have not noticed the propoſal of curing ganglions with cauſtic; we deem it highly objectionable, and hope that, in future, no reſpectable ſurgeon will ever put it in practice. Irritating a ganglion with cauſtic is a moſt likely method of converting the ſwelling into a very dangerous diſeaſe.

GANGOUTRA, ſignifying the *fall* or *caſcade* of the Ganga or Ganges, in *Geography*, a cavern, ſtyled by the Hindoos the "Cow's mouth," through which the Ganges paſſes. The *Upper* Gangoutra is about 280 or 300 road miles above Hurdwar, where the Ganges enters the plains of Hindooſtan, placed by Tienſentaller in the parallel of 33° N. The *Middle* Gangoutra is at Deuprag, where the Baghyretty, ſuppoſed by Major Rennell to be the true head of the Ganges, and the Alacknundra rivers, the former from the N. and the latter from the N. E. join at a few miles diſtance below Sirinagur, there forming the *Proper* Ganges of Hindooſtan. The *Lower* Gangoutra is the opening in mount Sewalick, at Hurdwar, through which it iſſues. See GANGES.

GANGPOUR, a circar of Hindooſtan, in the country of Oriſſa, bounded on the north by Juſhpour and Bahar, on the eaſt by Konjoor, on the ſouth by Sumbalpour, and on the weſt by Ruttunpour. The chief towns are Gangpour and Pada.

GANGPOUR is the capital of the circar, and is diſtant 244 miles W. from Calcutta. N. lat. 21° 2'. E. long. 84° 10'.

GANGRA, in *Ancient Geography*, a town of Paphlagonia, the reſidence of Mopſus, king of the country, which ſent ſuccours to the Galatians againſt the Romans in the time of Antiochus the Great.—Alſo, a town of Arabia Felix. Steph. Byz.

GANGRÆNA ORIS. This denotes, in *Surgery*, a deep, irregular, ill-conditioned ulcer, ſituated on the inſide of the lips and cheek. The preceding name is that which was adopted by Van Swieten; but the diſeaſe has had ſeveral other appellations beſtowed upon it. Sennertus denominates it *aphthæ ſerpentes*; while the generality of the French writers call it *gangréne ſcorbutique des gencives*. It has alſo been named *labroſulcium*, and *cheilocace cancrum oris*, &c.

The malady is generally attended with a copious ſecretion of the ſaliva; and it commonly affects children under ſeven years of age, and ſeldom grown up perſons. The edges of the ulcer are remarkably jagged, and, when the complaint attacks the inſide of the lip, the ulceration ſpreads with celerity to the inſide of the cheek, which ſwells and feels hard. The gums are ſometimes involved in the diſeaſe, while the teeth are looſe and carious. Abſceſſes may alſo occur, and burſt in various adjoining ſituations. It is ſaid, that exfoliations ſometimes take place from the alveolar proceſſes, and other parts of the lower jaw-bone.

The gangræna oris, for the moſt part, is found to affect the children of the poor, or ſuch as reſide in damp places, are not kept duly clean, live on bad food, and are much crowded together. The exact cauſe of the malady, however, is unknown. When the affection is neglected, it may produce moſt dreadful degrees of ſloughing.

Although the gangræna oris is uncommon in adults, they are ſometimes afflicted with it.

The internal treatment, recommended by authors, conſiſts principally of milk and vegetable diet, bark, vitriolic acid, porter, &c.

The applications to the diſeaſe itſelf may be diluted vitriolic acid, burnt alum, the tincture of myrrh, the decoction of bark with the ſulphate of zinc, or a mixture of lime-water and ſpirit of wine, as may be found to agree beſt. Sometimes theſe applications may be uſed as gargles; ſometimes by wetting in them ſoft pieces of lint, which are to be put and kept upon the ſore.

GANGRÆNA *Oſſis*, ſometimes denotes a caries; ſometimes the diſeaſe known by the name of ſpina ventoſa.

GANGRENE, derived from the Greek γαινω, *to feed upon*, becauſe the fleſh is eaten away or deſtroyed by it. The expreſſion is very commonly uſed in the ſame ſenſe as the word *mortification*, which, we know, denotes the death of ſome part of the body. However, it is to be obſerved, that when the whole, or a conſiderable portion of a bone dies, without any of the fleſh being involved in ſimilar miſchief, the caſe is not denominated a *gangrene*, but a *necroſis*, as we ſhall have occaſion to explain more fully in a future volume of this Cyclopædia.

Although gangrene and mortification are not unfrequently employed ſynonymouſly by many reſpectable writers and practitioners, yet a diſtinction is ſometimes drawn, of which we ſhall preſently make mention.

Mortification is a diſorder which ariſes from an immenſe number of different cauſes, and, of courſe, it varies very conſiderably in the manner of its attack, its progreſs, and degree of danger. The caſes of the diſeaſe are frequent, and, as they often put the life of the patient into a ſtate of imminent peril, always ſtand in need of judicious ſurgical aſſiſtance, and have been indiſcriminately treated of by many writers, we feel that the ſubject before us admits of much uſeful diſcuſſion. We ſhall find that a good deal of error has prevailed in the general treatment of mortifications, principally, in conſequence of that blind enthuſiaſm which exaggerated

the Peruvian bark into a ſpecific for every kind of gangrene. It is far from our intention to ſay, that this medicine has not often done good in theſe caſes; we acknowledge that it has been highly ſerviceable in numerous inſtances; but we have no heſitation in aſſerting, that much harm has alſo ariſen from exhibiting bark in ſome examples in which it was not indicated, and from overloading the ſtomach with it on other occaſions, where the medicine might have been productive of real good, had it only been preſcribed with moderation.

Nor has the topical treatment of gangrene always been ſuch as ſhould entitle it to approbation. Of late years, indeed, the proper kind of local applications, and the circumſtances in which making inciſions into the part affected can prove uſeful, have been explained. Yet what man, that has ſeen any thing of ſurgery, can conſcientiouſly declare, that modern practice is altogether delivered from ſome abſurd prejudices about the virtues of a certain claſs of remedies, denominated antiſeptics?

We truſt, that the correctneſs of the preceding criticiſms will become the more ſtriking, the further the reader advances in the peruſal of the account which we have to offer of the ſubject, and the more he compares our ſtatement with the facts demonſtrated to him by experience.

We ſhall firſt detail the common ſymptoms and appearances attendant on ſuch mortifications as are preceded by inflammation.

When the mortification is beginning, the pulſe immediately becomes much weaker, and ſometimes irregular; the patient experiences a conſiderable proſtration of all the vital powers; and, after a violent increaſe of ſuffering, the pain in the part affected undergoes a ſudden diminution. A diſagreeable hiccough, repeated ſickneſs, and different degrees of delirium, are alſo the frequent concomitants of this ſort of local miſchief.

In the ſeat of the inflammation the integuments are affected with a livid diſcolouration, and change ſucceſſively from a red to a yelloviſh, and, laſtly, a greeniſh hue. The cuticle, in various places, riſes in the form of veſicles, which are generally filled with a turbid fluid. The ſwelling, tenſion, and hardneſs ſubſide, and, on touching the part, a crackling ſenſation is communicated to the fingers, owing to the generation of air in the cellular ſubſtance. Still, however, the part is not completely dead, as it retains ſome of its natural warmth and ſenſibility. It is particularly to this firſt ſtage of mortification that the term *gangrene* is applied.

When the organization of the parts is totally deſtroyed, together with all veſtiges of their natural ſtructure, and the gangrenous place is converted into a cold, black, fibrous, inſenſible maſs, a *ſphacelus*, or *complete mortification*, is ſaid to have happened.

A portion of the ſoft parts, in this dead, black condition, is technically named a *ſlough*, except when the piece of fleſh has been killed with cauſtic or fire, in which caſe the part which is deſtroyed is more frequently called an *eſchar*.

When any conſiderable portion of the body is affected with mortification, the conſtitution always ſeems to ſuffer a ſudden and an alarming ſhock. The eyes immediately exhibit that peculiar appearance, which Mr. Pott, in his book on ruptures, has diſtinguiſhed by the name of lack-luſtre. The whole ſyſtem is terribly dejected; the countenance all at once puts on a wild, wretched, cadaverous look; the pulſe generally becomes ſmall, rapid, and, as we have already ſtated, in ſome inſtances irregular; the ſkin is moiſtened with cold, clammy perſpirations; an inceſſant purging is apt to occur, and, frequently, the unhappy patient, after being more or leſs delirious, falls a victim to the diſorder.

We think, that the beſt general diviſion of mortification is that adopted by Mr. John Hunter, who remarks, that all theſe caſes are of two kinds; the one, without inflammation; the other, preceded by it.

This celebrated ſurgeon regarded inflammation as an increaſed action of that power which a part naturally poſſeſſes. It was his opinion that ſuch an affection (when of the healthy ſort) was probably attended with an increaſe of power; but, ſays he, in inflammations which terminate in mortification, there is no increaſe of power, but, on the contrary, a diminution of it. He thought that this loſs of power becomes, when joined to an increaſed action, a cauſe of mortification, by deſtroying the balance which ought to ſubſiſt between the power and the action of every part.

Mr. Hunter makes mention, alſo, of certain caſes of mortification, which, though they are preceded by inflammation, do not depend wholly upon it as a cauſe, but ſeem to have ſome peculiarity in their nature. Of this kind are the carbuncle, and the ſlough formed by the ſmall-pox puſtule. (See Hunter on the Blood, Inflammation, &c. p. 8.)

Let us now take a view of the various remote cauſes of gangrene and ſphacelus. Inflammation is the firſt, which deſerves particular attention. Parts which are violently and extenſively inflamed are frequently obſerved to mortify. However, it is not uſual for common phlegmonous inflammation to end in ſuch miſchief, unleſs the ſtate of the conſtitution is very bad, or the parts affected happen not to be endued with ſtrong vital powers, or are in a dropſical or paralytic condition. Eryſipelas often brings on mortification; and ſo does an exceedingly vehement ſpecies of inflammation, ſometimes known by the name of irritative. Phlegmon generally ends in reſolution; ſometimes, in ſuppuration; ſeldom in gangrene. At the ſame time, every man, at all converſant with ſurgery, knows, that any ordinary inflammation is apt to induce a mortification when the patient's habit is particularly weak, irritable, or unhealthy, or when the ſyſtem is conſiderably reduced by the effects of old age. It is alſo a well-known fact, evinced by daily experience, that very ſlight inflammations of anaſarcous and paralytic parts will bring on gangrene. It is on this account that making ſcarifications in the ſcrotum, or any of the limbs affected with anaſarca, is not altogether free from dangerous conſequences. There are likewiſe particular parts of the body, which cannot bear much inflammation, without inevitably falling into a ſtate of mortification. Of this nature are all tendons and faſciæ, which often ſlough, while the ſkin, which covers them, is not affected with the ſame kind of diſorder. The reaſon of this circumſtance ſeems imputable to the inferior vaſcularity of all tendinous ſtructures. The ſkin, which is at the ſame time inflamed, appears to be ſaved by being highly organized, exceedingly vaſcular, and endued with great vitality. When parts of new formation are affected with common inflammation, they are always very prone to mortify, and this circumſtance is probably owing to the ſame principle, which makes inflamed tendons and faſciæ ſo readily ſlough; for, all ſarcomatous and encyſted tumours, as well as all excreſcences, warts, &c. are, in the opinion of modern pathologiſts, furniſhed with leſs vitality than the generality of ſuch parts as enter into the natural and original formation of the body.

Of the ſeveral remote cauſes of gangrene, eryſipelas is thought to be the moſt frequent; for, whenever this ſpecies of inflammation falls into the ſuppurative ſtate, a great deal of ſloughing is always produced wherever the matter happens to be ſituated; and ſince, in eryſipelatous abſceſſes, the pus is not confined by any ſurrounding cloſure of the interſtices of the cellular ſubſtance with coagulating lymph, we find that the matter generally finds its way very extenſively

ſively in different directions, occaſioning gangrenous diſorder whereſoever it happens to ſpread. In many of theſe inſtances all the ſloughing is beneath the ſkin, chiefly affecting the faſciæ, tendons, and cellular ſubſtance. In ſome caſes, the high vaſcularity of the ſkin does not altogether ſave it, a portion of it dying, and turning black. On ſome occaſions, the quantity of integuments deſtroyed is large; in other examples it is ſmall, while the ſubjacent gangrenous miſchief is conſiderable. Sometimes, alſo, when ſloughing is the conſequence of eryſipelas, the ravages are not confined to the cellular ſubſtance, tendons, aponeuroſes, and ſkin; but the muſcles, large veſſels, and bones are alſo deſtroyed, ſo that the whole thickneſs of the limb is left in a complete ſtate of ſphacelus.

Any thing which entirely cuts off the requiſite ſupply of blood to a part may be the occaſion of a mortification. The knowledge of this circumſtance ſometimes leads to a rational method of curing polypi, and other morbid excreſcences. The ſurgeon knows, that, if he can ſucceed in putting a tight ligature round the necks of ſuch tumours, the circulation of blood in the ſwellings will be ſtopped, and they of courſe will ſlough and fall off. The effects of ſtopping the flow of blood into parts are often ſeen in caſes of ſtrangulated herniæ and wounded arteries, and when a bandage is applied with unwarrantable tightneſs. Surgical writers mention the occurrence of mortification from aneuriſmal tumours, and other large ſwellings, the preſſure of which is repreſented as hindering the influx of blood into the part. The oſſified ſtate of the arteries, in old perſons, is alſo ſet down as becoming a cauſe of mortification, by impeding the due ſupply of blood.

Mortification will alſo be occaſioned by any circumſtance which entirely prevents the return of blood from a part. In this caſe, the blood-veſſels become turgid, and the part is quickly affected with pain, ſwelling, and lividity. Veſicles ſoon ariſe, and, at length, the ſeat of the diſorder becomes ſoft, œdematous, emphyſematous, cold, black, inſenſible, and fetid. Here the ſymptoms are ſomewhat different from ſuch as attend a mortification from ſome impediment to the entrance of arterial blood into the part. In the latter inſtance, the part is ſaid to be at firſt affected with ſoftneſs and coldneſs, and a diminution of its ſize; then it becomes inſenſible, ſhrivelled, black, and lifeleſs.

Mortification frequently attacks patients whoſe complaints compel to remain a long while in bed in the ſame poſture. In this example, the ſloughing is chiefly attributable to the unremitted preſſure which parts ſuſtain, and which obſtructs the circulation. Surgeons have frequent opportunities of beholding melancholy inſtances of this kind of mortification, particularly in caſes of fractures, paralyſis from diſeaſed vertebræ, &c. The miſchief moſt readily occurs where the bones have the leaſt fleſh upon them, and, conſequently, where all external preſſure muſt operate with the greateſt effect; as, for inſtance, about the os ſacrum, os ilium, trochanter major, the ſpine of the ſcapula, &c. The diſordered part, in this caſe, always becomes at firſt ſoftiſh, livid, red at the circumference, and œdematous, afterwards entirely loſing its ſenſibility, and acquiring a black appearance. When the ſlough is detached, a foul ſpreading ulcer is always left. The preſſure on parts, from long confinement in one poſture, more readily occaſions mortification, when the conſtitution is particularly circumſtanced. Previous fever, dropſy, paralyſis, the languid circulation of old age, &c. all render the diſorder more eaſy of production.

Some of the remote cauſes of mortification operate by actually ſubverting the organization of the part. Bad comminuted compound fractures, attended with extenſive injury of the ſoft parts, and a wound of the main arteries of the limb; very large contuſed lacerated wounds, &c. thus induce gangrene and ſphacelus. The action of fire and cauſtic ſubſtances may be ſaid to bring on ſloughing on the ſame principle; for a total deſtruction of all natural organization muſt be the conſequence of the chemical decompoſition of any part of the animal body. We ſhould obſerve, however, that the heat applied muſt be very great to kill and decompoſe the fleſh at once; and that, when mortification ariſes from burns, under any other circumſtances, the affection muſt be preceded by inflammation.

Long expoſure to certain degrees of cold will often give riſe to gangrene and ſphacelus, particularly when the benumbed frozen parts are imprudently expoſed, all at once, to the fire. In this circumſtance, a violent ungovernable inflammation is ſuddenly excited, which rapidly ends in a mortification. Bad chilblains afford a mild example of ſuch a caſe; while a ſevere one may be ſeen in the ſphacelus of a whole extremity. Cold will more readily make parts ſlough, when the ſyſtem is debilitated by poor living, or any previous diſeaſe. We have ſeen, in the hoſpitals of the metropolis, many Laſcars, whoſe feet had mortified in conſequence of the cold of this climate, and want of proper nouriſhment. In former times, alſo, numerous Africans out of ſlave ſhips uſed to be ſeen in the London hoſpitals, whoſe limbs were ſometimes in a ſtate of ſphacelus, from the combined effect of cold, poor living, and ill-treatment, and ſometimes, as we are ſorry to remark, from the cruel preſſure of their irons. The treatment of frozen and froſt-bitten parts we ſhall preſently conſider.

The furunculus and carbuncle are diſeaſes which are always attended with a greater or a leſs degree of gangrenous diſorder, as the reader may learn more particularly by a reference to thoſe articles.

Mortification is ſtated to originate ſometimes from unknown epidemic cauſes; and inſtances are mentioned, in which all the ſores and wounds in a large hoſpital have become, about the ſame time, affected with gangrene. Gangrene and ſphacelus ſometimes proceed from inexplicable cauſes. The occaſion of that ſpecies of mortification, which begins in one of the toes, and extends thence up the leg, is not exactly underſtood. We ſhall preſently introduce Mr. Pott's intereſting obſervations on this particular caſe.

Having noticed the general ſymptoms of mortification, the principal remote cauſes, and the diviſion of the diſorder into two kinds, one preceded by inflammation, the other not, we now proceed to the conſideration of ſome other circumſtances which require explanation, before we begin to ſpeak of the treatment.

Beſides the diviſion of mortifications into ſuch as are preceded by inflammation, and into others which are not, ſurgical authors have made ſome other diſtinctions; for inſtance, the *dry* and *humid* gangrenes; the *white* gangrene, &c. The two firſt kinds are characteriſed by the little or great quantity of moiſture about the ſphacelated part. Hildanus, Tulpius, Queſnay, Bertrandi, and others have treated of the dry gangrene in their reſpective writings.

In the *white* gangrene, the mortified parts are ſaid not to turn black, but to retain nearly their natural colour. Queſnay has taken particular notice of this curious variety of the diſtemper.

A mortified part may be conſidered, in relation to the reſt of the body, as an extraneous ſubſtance, the ſeparation of which will be equally conducive to the comfort and recovery of the patient. However, it ſhould be known, that a ſlough does not admit of removal as ſoon as it is formed; for although there is no vital connection between the dead and living

living matter, yet a mechanical union exiſts until the abſorbent veſſels have had time to take away ſuch particles as connect the ſound fleſh with the dead maſs. Were a ſurgeon imprudently to uſe force for the purpoſe of tearing away an extenſive mortified part, he would ſubject the patient to the danger of a renewal of the ſloughing, put him to unwarrantable pain, and bring on a hæmorrhage, which, in a debilitated ſtate of the ſyſtem, might lead to fatal conſequences. The detachment of a ſlough is altogether the work of nature, and the ſurgeon can only uſefully interfere in removing ſuch portions of the mortified maſs as are completely looſe. When a mortification ceaſes to ſpread, the adjoining edge of the living part ſoon exhibits the appearance of a red line, or border, which is a ſign much taken notice of by all experienced ſurgeons; becauſe it ſhews that the ſpreading of the mortification has ſtopped, and that the limb, which could not prudently be amputated before, may now be removed, if circumſtances make the proceeding neceſſary. Soon after the red line of ſeparation appears, ſuppuration commences. At firſt, a ſmall quantity of matter iſſues from the ſpace between the ſlough and the living ſurface, and the diſcharge of purulent matter gradually becomes more and more copious. The pus is of courſe ſecreted from the veſſels of the living part; but it muſt be manifeſt, that before the matter can be poured out, a ſpace muſt be formed for it between the ſlough and the living parts. The preſent received opinion is, that ſuch an interſpace is produced by the action of the abſorbent veſſels, which are on the living ſurface, and which, in fact, effect the detachment of the dead maſs, by removing ſuch particles of matter as connect it with the living fleſh. The inflammation which ariſes on the living edge, as ſoon as the mortification ceaſes to ſpread, and which precedes the detachment of the ſlough, ſeeming eſſential to the completion of that proceſs, is ſaid to depend chiefly upon the preſence of the ſlough, which operates as an extraneous ſubſtance on the living matter with which it is in contact. Thus, the living ſurface is made to inflame, redden, and ſuppurate.

Some philoſophizing writers affect to ridicule the opinion, that the ſeparation of a dead from a living part is chiefly accompliſhed by the action of the abſorbent veſſels, or, by what a formal modern author is pleaſed to term the "mordicant powers of abſorbent orifices." (See Pearſon's Principles.) Theſe ſages, however, do very wrong to torture their intellectual powers with ſubjects which, of all others, are the leaſt calculated to receive elucidation from ſuch dim rays as emanate from ordinary genius. To any man free from the vanity of ſetting up ſome new weak hypotheſis, and of endeavouring to ſubvert the better eſtabliſhed opinions of others, merely to make way for the inſignificant offspring of his own fancy, there will be no more difficulty in conceiving how any of the particles of the body can be taken away by one ſet of veſſels, called abſorbents, than in conceiving how ſuch particles can be depoſited by another order of veſſels, named arteries.

It is a curious circumſtance, in the hiſtory of mortification, that the blood coagulates for ſome way up the large arteries which lead into the mortified portion of a limb. Were it not for this event, the ſeparation of the dead part would generally be productive of a fatal hæmorrhage.

There is a ſpecies of ſphacelus which ſpreads with immenſe rapidity, and is exceedingly dangerous, hardly leaving any time for the trial of remedies. Sometimes, however, a mortification ſpreads ſo ſlowly, that it does not occupy much extent at the end of ſeveral months; yet the caſe is frequently not the leſs fatal on this account. The danger is never altogether paſt until the dead part is ſeparated. It is ſaid, that long after a mortification has ceaſed to ſpread, the patient may die in conſequence of the abſorption of ſome of the putrid matter into the circulation. With regard to the prognoſis, we can only offer a few general remarks. The degree of danger will always be, in a great meaſure, proportioned to the ſize of the part affected, and its importance in relation to the neceſſary operations of the animal economy. The event of every caſe will alſo be conſiderably influenced by the age and conſtitution of the patient.

In forming a judgment concerning the hope of a recovery, we ſhould not be entirely actuated by ſuperficial appearances. Often, when a part looks quite black and completely ſphacelated, its total deſtruction does not enſue; for in many caſes the diſorder only affects the ſkin and cellular ſubſtance. The integuments frequently ſlough away, and we have the happineſs to find that the tendons, muſcles, and other organs underneath, are perfectly ſound, ſo that ſtrong hopes of a recovery may be juſtly entertained.

No favourable prognoſis can ever be delivered while a mortification is in a ſpreading ſtate. Nor ſhould any flattering proſpects be held out in any inſtance in which the quantity of ſloughs and putrid matter is large, and the patient old and vaſtly debilitated. After the deſtructive proceſs has ſtopped in the part, the ravages may be too great for the ſyſtem to repair, and the diſcharge too copious and weakening; or the patient may ſuddenly periſh, as authors aſſert, in conſequence of the effects of putrid matter abſorbed into the circulation.

Treatment of Gangrene and Sphacelus.—The treatment of every kind of mortification is divided into *conſtitutional* and *local*; the firſt compriſing ſuch internal remedies as are indicated by the ſtate of the general ſyſtem; the ſecond comprehending whatever is neceſſary to be applied or done to the mortified part itſelf.

When a mortification is in a ſpreading ſtate, is the conſequence of violent inflammation, and is attended with a ſtrong, full, frequent pulſe, and other ſymptoms of inflammatory fever, the antiphlogiſtic treatment is obviouſly indicated. As for the part which is already ſphacelated, no kind of ſurgery can reſtore it to its original ſtate; with reſpect to the living circumference, which is in danger of being next deſtroyed, and which may be materially affected by the conduct of the practitioner, in what other ſtate can it be regarded, except that of ſuch vehement inflammation as is the forerunner of gangrene? Hence, the ſame kind of conſtitutional treatment is required as in other inflammatory caſes, namely, bleeding, purging, antimonials, low diet, &c. However, there is this difference, that as the ſyſtem always ſoon ſuffers a conſiderable dejection, and the ſtrength ſuddenly ſinks, when a large portion of the body mortifies, the ſurgeon is obliged to be very cautious in not carrying the plan of evacuations too far. Were he to employ the lancet, and exhibit purgatives as freely as in any common inſtance of phlegmonous inflammation, the patient would often be reduced, partly by the diſeaſe, and partly by the treatment, into a ſtate of debility, from which no ſucceeding ſkill could extricate him.

As the change from the violence of inflammation into gangrene and ſphacelus is always attended with a ſevere degree of pain, it is indiſpenſably proper to adminiſter opium, with a view both of alleviating the ſufferings, and procuring ſleep.

Numerous practitioners, and, we may ſay, the majority of writers, recommend the exhibition of bark in the preceding inſtance, though as far as our obſervations extend, without either being influenced by any rational principles, or at all encouraged by unqueſtionable ſucceſs. For, admitting

mitting that bark has the wonderful virtue of directly imparting ſtrength to the human conſtitution, how inconſiſtent it ſeems at once to adopt meaſures which lower the ſyſtem, and put in practice other things which tend to ſtrengthen! We wiſh, however, our cenſures on this uſe of bark only to extend to the period while the mortification is accompanied with conſiderable inflammation, and the ſtrong actions of the common inflammatory fever; for when this ſtage is over, we agree that all evacuations ſhould be omitted, and a tonic treatment be immediately followed.

The partiſans of the Peruvian bark have, indeed, the authority of Mr. Hunter on their ſide, who thought it a ſingularly efficacious medicine in all caſes of mortification preceded by inflammation, inaſmuch as he believed it had the peculiar virtue of increaſing the powers, and leſſening the action in the part. What man of experience, however, who is not a bigot to theory, can ſuppoſe that bark will actually diminiſh the action in a part affected with the higheſt degree of inflammation? If it poſſeſſes this miraculous quality, why is it not regularly preſcribed in all caſes of inflammation? Why not put at the head of the liſt of antiphlogiſtic remedies? In practice, we could never find a fact in proof of the alleged property of bark in leſſening action. We believe that the reaſon of this medicine being indiſcriminately given in every ſtage and ſpecies of mortification, is referable to cauſes which were ably pointed out by that excellent practical ſurgeon Mr. Samuel Sharp, whoſe obſervations we ſhall preſently quote.

We are happy in finding ſome practitioners yet unblinded by prejudices in favour of bark. Among theſe we have to notice the reſpectable German ſurgeon, Richter. This experienced writer remarks, that there are three different kinds of fever, which are obſerved to be attendant on the various ſpecies of mortification, namely, the ſympathetic inflammatory fever, one accompanied by extreme debility, being in all probability of a typhoid nature; and another fever, which ſeems to be intimately connected with a diſordered ſtate of the abdominal viſcera.

The inflammatory fever takes place when the mortification is the conſequence of acute inflammation, which has been produced by ſome external injury in a healthy conſtitution. Here, ſays Richter, bark is in general hurtful.

The ſecond fever, which we have juſt mentioned, certainly demands the exhibition of bark.

The third, however, or that which is dependent on diſorder of the chylopoietic organs, is not likely to be benefited by bark, becauſe one of the principal indications is to procure free evacuations from the ſtomach and bowels. See Richter's Anfangsgründe der Wundarzneykunſt, Baud I. Kap. 3.

Our chief wiſh, in the foregoing remarks, is to convince the reader, that while a gangrene is ſpreading, attended with a ſtrong frequent pulſe and other ſymptoms of inflammatory fever, and while the local miſchief is ſurrounded by acute inflammation, the treatment ſhould be of the antiphlogiſtic kind, and bark need not be adminiſtered, a moderate employment of evacuations being the moſt likely means of averting the deſtruction which impends over the highly inflamed parts, which are immediately around ſuch as are already dead.

Inconſiſtent, however, as the practice of giving barks in this inflammatory ſtage of mortification appears to us, we are far from ſaying any thing againſt the exhibition of the medicine the moment the ſtrong actions of the inflammatory fever ceaſe, and ſigns of approaching debility commence. All evacuations muſt now be diſcontinued, and the patient's ſtrength ſupported by every means in our power. The moſt rational mode of effecting this object undoubtedly conſiſts in giving ſuch food as is at once the moſt nouriſhing and moſt eaſy of digeſtion, ſuch as jellies and good ſoups. Bark may now be advantageouſly employed, if only given in moderation, ſo as to improve the tone, inſtead of oppreſſing the functions of the digeſtive organs. With bark, the practitioner may join the vitriolic acid, laudanum, aromatic confection, or æther, as his diſcretion may direct. The patient ſhould alſo be allowed a moderate quantity of Madeira, or port wine, and either ale, porter, or cyder, as may agree with his conſtitution beſt. In ſome caſes brandy may be given with great benefit, and the uſe of opium ſhould ever be remembered.

Whenever bark is indicated in caſes of mortification, we conceive that the moſt eligible way of deriving benefit from it is to preſcribe moderate quantities of the medicine, perhaps about two ounces of the decoction, with a little of the tincture, about three times a day. We decidedly reprobate the plan of cramming the ſtomach with the decoction, tincture, and powder, all made into a thick mixture. We have ſeen ſome hoſpital ſurgeons in this city eagerly ſeize every opportunity in theſe caſes of preſcribing the foregoing farrago, ſometimes denominated the *bark in full*, as if the degree of benefit would certainly be in a ratio to the quantity of the medicine crammed down the patient's throat. Such practitioners muſt ſurely entertain ſtrange notions, both of the virtues of bark, and of the nature of the human alimentary canal. They muſt ſuppoſe that a certain portion of ſtrength will be extracted from every grain of ſolid bark, which can juſt be got down the revolting œſophagus into the ſtomach. When the medicine is in the latter place, they ſeem to fancy that a degree of vigour, proportioned to the weight and quantity of the remedy ſwallowed, will ſurely be extricated from the miraculous mixture by the digeſtive organs, and infuſed into the ſyſtem. They alſo appear to think that the ſtomach and bowels muſt be as inſenſible as leathern bags, or dead bladders, into which any quantity of a thing may be ſtowed without the leaſt harm, ſo that they do not actually burſt.

Our ſentiments are far different. We believe that bark has no direct power of imparting ſtrength to the human conſtitution, and that it has a ſtrengthening effect only in as much as it improves the tone of the ſtomach, with which it comes into contact. If this be correct, how unlikely is it that any good will be produced by loading the ſtomach and bowels with as much of the medicine as the patient can be made to ſwallow. Will not ſuch a method be more oppreſſive than beneficial to the digeſtive organs? Is not the abſurdity of the practice diſplayed every day? Do we not ſee the patients themſelves remonſtrating? Do they not frequently make complaint that the bark ſickens, purges, and ſo diſorders them, that they can keep no nouriſhment within them, and that inſtead of being ſerved by the remedy, they are almoſt killed by it? Let bark only be given in the way which we have adviſed, and whatever good it is capable of doing will be obtained.

Sometimes bark will produce purging, though adminiſtered with moderation, in which circumſtance a few drops of the tinctura opii ſhould be added to each doſe. Frequently the ſtomach will not bear the decoction of this medicine. In ſuch caſes bark ſhould be tried in the form of a very ſubtile powder, or the infuſion, or the tincture, may be exhibited.

Thus we ſee, that in caſes of gangrene bark is ſometimes proper, ſometimes inefficacious, and ſometimes abſolutely pernicious, and that it can only be conſidered as a uſeful medicine when preſcribed by practitioners of diſcrimination,

mination. We ſee, alſo, that in certain inſtances of mortification, although bark is at firſt improper, it is afterwards ſtrongly indicated by the change of circumſtances.

We have ſtated, that bark ſhould be adminiſtered whenever any ſpecies of gangrenous diſorder is attended with a ſtate of the ſyſtem, reſembling that which occurs in typhus fever, and, generally, whenever great debility is decidedly preſent. The anthrax, or carbuncle, we know, is a diſeaſe always attended with more or leſs ſloughing, as well as with a depraved conſtitution, and a remarkable proſtration of ſtrength. Bark is found, in this inſtance, to be followed by the moſt beneficial effects.

It is alſo a highly valuable medicine in almoſt all mortifications which are the conſequence of eryſipelatous inflammation. Let it ever be recollected, however, that, in no caſe, ought bark to be given in immoderate doſes, nor when it diſagrees with the ſtomach and bowels.

One principal cauſe, which has induced ſurgeons to order bark in all caſes of mortification, without the leaſt diſtinction, is the manner in which this medicine has been puffed off as a *ſpecific* for gangrenous diſorders, which it has been alleged to ſtop by ſome peculiar virtues, which no other article of the materia medica poſſeſſes. The dark days of prejudice, however, have ſeldom been altogether deſtitute of ſome few diſcerning men, whoſe abilities and ſtrength of underſtanding have not ſuffered them to be deceived and led aſtray by the vague opinions of the multitude. Among ſuch exalted characters, Mr. Samuel Sharp, ſurgeon of Guy's Hoſpital, merits a conſpicuous place. Notwithſtanding he lived in times when bark was praiſed up to the ſkies, and repreſented, in almoſt every publication of the day, as curing ſome melancholy ſpecimen of mortification, he never allowed himſelf to be blinded by any paper aſſertions, nor his eyes to be turned away from the facts which preſented themſelves in his own extenſive practice. The following obſervations of this experienced ſurgeon are as pertinent and intereſting now, as they were at the period when they were originally publiſhed. "There has lately ſtarted up in Great Britain a new practice of treating this complaint (meaning a mortification), which, at preſent, makes ſome noiſe in other parts of Europe, and is therefore worth our attention. Every body will immediately conclude, that I mean the cortex peruvianus, which, within theſe few years, has been ſo exalted for its virtues in ſtopping a gangrene, that the cautery itſelf was not more eſteemed amongſt the ancients, than is this medicine by ſome of the moderns. I know it will be looked upon by many as a kind of ſcepticiſm to doubt the efficacy of a remedy ſo well atteſted by ſuch an infinity of caſes; and yet I ſhall frankly own, I have never clearly, to my ſatisfaction, met with any evident proofs of its preference to the cordial medicines uſually preſcribed; though I have a long time made experiment of it, with a view to ſearch into the truth.

"Perhaps it may ſeem ſtrange thus to diſpute a doctrine eſtabliſhed on, what is called, matter of fact; but I ſhall here obſerve, that, in the practice of phyſic and ſurgery it is often exceedingly difficult to aſcertain a fact. Prejudice, or want of abilities, ſometimes miſleads us in our judgment, where there is evidently a right and a wrong; but, in certain caſes, to diſtinguiſh how far the remedy, and how far nature operate, is probably above our diſcernment. In gangrenes, particularly, there is frequently ſuch a complication of unknown circumſtances, as cannot but tend to deceive an unwary obſerver. Mortifications, ariſing from mere cold, compreſſion, or ſtricture, generally ceaſe upon removing the cauſe, and are, therefore, ſeldom proper caſes for proving the power of bark. However, there are two kinds of gangrene where internals have a fairer trial; theſe are a ſpreading gangrene from an internal cauſe, and a ſpreading gangrene from violent external accidents, ſuch as gun-ſhot wounds, compound fractures, &c. Yet, even here, we cannot judge of their effect with abſolute certainty; for ſometimes a mortification from internal cauſes is a kind of critical diſorder. There ſeems to be a certain portion of the body deſtined to periſh, and no more. Of this we have an infinity of examples brought into our hoſpitals, where gangrene ſtops at a particular point, without the leaſt aſſiſtance from art. The ſame thing happens in the other ſpecies of gangrene from violent accidents, where the injury appears to be communicated to a certain diſtance, and no farther; though, by the way, I ſhall remark in this place, contrary to the received opinion, that gangrenes from theſe accidents (where there has been no previous ſtraightneſs of bandage) are as often fatal, as thoſe from internal cauſes.

"As I have here ſtated the fact, we ſee how difficult it is to aſcertain the real efficacy of this medicine; but had bark, in any degree, thoſe wonderful effects in gangrenes which it has in periodical complaints, its pre-eminence would no more be doubted in the one caſe than in the other. What, in my judgment, ſeems to have raiſed its character ſo high, are the great number of ſingle obſervations publiſhed on this ſubject, the authors of which not having frequent opportunities of ſeeing the iſſue of this diſorder, under the uſe of cordials, &c. and ſome of them, perhaps, prejudiced with the common ſuppoſition, that every gangrene is of itſelf mortal, have therefore aſcribed a marvellous influence to the bark, when the event has proved ſucceſsful." (See Critical Enquiry, &c. chap. on Amputations.)

We ſhall now conclude the ſubject of bark in caſes of mortification. We have not allowed this medicine any direct power of imparting ſtrength, neither have we admitted, that it at all deſerves the name of a ſpecific in checking the progreſs of gangrene and ſphacelus. We have ſtated our belief, that it can only be the means of ſupporting the ſtrength inaſmuch as it may improve the tone of the digeſtive organs. With theſe principles, we have condemned the practice of making the patient take immoderate quantities of the remedy; ſo as to diſorder, inſtead of meliorating, the ſtate of the ſtomach and bowels. We have maintained, that bark is never indicated when the mortification is ſpreading, in conſequence of acute inflammation, in a patient not deficient in ſtrength; and when the affection is either attended with inflammatory fever, or with another fever depending on diſorder of the chylopoietic organs. In this laſt inſtance, the firſt indication is to empty the primæ viæ, and, afterwards, bark may be given, if circumſtances require it. We have allowed, that moderate doſes of bark may be exhibited with advantage in almoſt every ſpecies of mortification, immediately when evident ſigns of debility make their approach, ſo that the medicine will often be proper after a certain time, though it may not be indicated in the commencement of the caſe.

When a mortification is ſpreading in a very old, enfeebled patient, bark may be preſcribed with opium, cordials, and aromatic medicines; but we again repeat our own ſentiment, that, whenever the indication is to ſupport the ſtrength, it is much more rational to endeavour to effect this object by eligible kinds of nouriſhment, than by overloading the ſtomach with any kind of medicine whatſoever.

There is a particular ſpecies of mortification, beginning in the toes, and extending gradually to the foot and leg, and deſerving particular notice, as being an inſtance in

which bark is univerſally allowed to fail. This caſe is remarkable, alſo, on account of its not being benefited by that grand remedy, notwithſtanding the frequent concomitant evils of debility and old age. The late able Mr. Pott, whoſe writings ſhew, that he had as much faith in bark as moſt ſurgeons, could not acknowledge its efficacy in the inſtance to which we are alluding. The diſtemper begins at the extremity of one or more of the ſmall toes, and ſooner or later paſſes on to the foot and ankle, and ſometimes to a part of the leg, in former times, moſt commonly deſtroying the patient, in ſpite of all the aid of phyſic and ſurgery.

The annexed deſcription of the diſeaſe and its treatment is from the pen of Mr. Pott, whoſe ſurgical works are equally recommended by the practical knowledge which they contain, and by the fine animated ſtyle in which they are written.

He remarks, that this caſe "is very unlike to the mortification from inflammation, to that from external cold, from ligature, or bandage, or to that which proceeds from any known and viſible cauſe, and this as well in its attack as in its proceſs. In ſome few inſtances, it makes its appearance with little or no pain; but, in by much the majority of theſe caſes, the patients feel great uneaſineſs through the whole foot and joint of the ankle, particularly in the night, even before theſe parts ſhew any mark of diſtemper, or before there is any other, than a ſmall diſcoloured ſpot on the end of one of the little toes.

"It generally makes its firſt appearance on the inſide, or at the extremity, of one of the ſmaller toes, by a ſmall, black, or blueiſh ſpot: from this ſpot the cuticle is always found to be detached, and the ſkin under it to be of a dark red colour.

"If the patient has lately cut his nails, or corn, it is moſt frequently, though very unjuſtly, ſet to the account of ſuch operation.

"Its progreſs in different ſubjects, and under different circumſtances, is different; in ſome it is ſlow and long in paſſing from toe to toe, and from thence to the foot and ankle; in others its progreſs is rapid, and horridly painful: it generally begins on the inſide of each ſmall toe, before it is viſible either on its under or upper part; and when it makes its attack on the foot, the upper part of it firſt ſhews its diſtempered ſtate, by tumefaction, change of colour, and ſometimes by veſication; but wherever it is, one of the firſt marks of it is a ſeparation or detachment of the cuticle.

"Each ſex is liable to it; but for one female in whom I have met with it, I think I may ſay, that I have ſeen it in at leaſt twenty males. I think, alſo, that I have much more often found it in the rich and voluptuous, than in the labouring poor; more often in great eaters, than free drinkers. It frequently happens to perſons advanced in life, but is by no means peculiar to old age. It is not, in general, preceded or accompanied by apparent diſtemperature either of the part, or of the habit. I do not know any particular kind of conſtitution which is more liable to it than another; but as far as my obſervation goes, I think that I have moſt frequently obſerved it to attack thoſe, who have been ſubject to flying uncertain pains in their feet, which they have called gouty, and but ſeldom in thoſe who have been accuſtomed to have the gout regularly and fairly. It has, by ſome, been ſuppoſed to ariſe from an oſſification of veſſels; but for this opinion I never could find any foundation but mere conjecture.

"The common method of treating this diſtemper is, by ſpirituous fomentations, cataplaſms actually and potentially warm, by dreſſings of the digeſtive kind, as they are called, animated with warm, pungent oils and balſams, &c. and, internally, by the Peruvian bark.

"I wiſh I could ſay that this, which, with little alteration, has been the general practice, had been moſt frequently, or even often ſucceſsful; but I am, from long and repeated experience, obliged to ſay, that it has not.

"I am ſenſible, that many of my readers will be ſurpriſed at my affirming, that the Peruvian bark will not ſtop a mortification, a diſtemper in which, for ſome years, it has been regarded as ſpecific; but I muſt beg not to be miſunderſtood: I mean to confine my obſervation and my objection to this particular ſpecies of mortification, which I regard as being ſui generis: and under this reſtriction I muſt repeat, that I have ſeldom, if ever, ſeen the bark ſucceſsful: in all other caſes, wherein it is uſed or recommended, no man has a higher opinion of it; but, in this I cannot give it a praiſe, which it does not deſerve.

"I believe I may venture to ſay, that I have tried it as fairly, as fully, and as variouſly as any man has or can: I have given it in the largeſt quantity, at the ſhorteſt intervals, and for the longeſt poſſible ſpace; that is, as long as the patient's life would permit: I have given it by itſelf in decoction, extract, and ſubſtance; I have combined all theſe together; I have joined it with nitre, ſal. abſynth. with ſnake-root, with confect. cardiac. with volatile ſalts, and with muſk, as different circumſtances ſeemed to require, or admit: I have uſed it as fomentation, as poultice, as dreſſing; I have aſſiſted it with every thing which has been uſually thought capable of procuring, or aſſiſting digeſtion; ſtill the diſtemper has continued its courſe, perhaps a little more ſlowly, but ſtill it has ended in death.

"I am ſorry to rob one of our great medicines of any part of its ſuppoſed merit, but as on the one hand, its claim, in this inſtance, is unjuſt, and as on the other, I hope to add as much to the character of another, the res medica will be no ſufferer.

"Some time ago, I had a patient labouring under this complaint, who, from antipathy, obſtinacy, or ſome other cauſe, could not be prevailed on to take bark in any form whatever. I made uſe of every argument, but to no purpoſe: fomentation, poultice, and the uſual dreſſings were applied in the uſual manner; the diſeaſe advanced ſome days more, ſome days leſs, and at the end of a fortnight the ſmall toes were all completely mortified, the great one become blackiſh, the foot much ſwollen, altered in colour, and the diſeaſe ſeeming to advance with ſuch haſty ſtrides, that I ſuppoſed a very few days would determine the event. The pain in the foot and ankle was ſo great, and ſo continual, as totally to deprive the patient of ſleep. On this account, and merely to procure ſome remiſſion, I gave two grains of opium at night, which not having the deſired effect, I repeated it in the morning. Finding, during the following day, ſome advantage, I repeated the ſame doſe night and morning, for three days; at the end of which time the patient became quite eaſy, and the appearances on the foot and ankle were viſibly more favourable. Encouraged by this, I increaſed the quantity of the medicine, giving one grain every three or four hours, taking care to watch its narcotic effect, and to keep the belly empty by glyſters. In nine days from the firſt adminiſtration of the opium, all the tumefaction of the foot and ankle totally ſubſided, the ſkin recovered its natural colour, and all the mortified parts plainly began to ſeparate; in another week they were all looſe, and caſting off, the matter was good, and the incarnation florid. During the whole of this time, I continued the uſe of the opium, varying its quantity as

circum-

circumſtances required, but never gave leſs than three or four grains in twenty-four hours.

" When the ſloughs were all caſt off, the bones ſeparated, and I had only a clean ſore to dreſs and heal, I gradually left off the medicine.

" I am very willing to acknowledge, that however well-pleaſed I might be with the event of this caſe, yet I really regarded it as accidental; ſo much ſo, that having very ſoon after another opportunity, I did not care to truſt to opium alone, but joined the bark with it. The event was equally fortunate. But although I had joined the cortex with the extractum thebaicum, and did therefore attribute the ſucceſs to their united powers, yet the effect was ſo very unlike to what I had ever ſeen from the bark without opium, that I could not avoid ſeriouſly, and often reflecting on it, and determining to uſe it by itſelf, whenever another opportunity ſhould offer. I did ſo, and ſucceeded in the ſame happy manner, though under the very diſagreeable circumſtances of ſeventy years of age, a broken, diſtempered conſtitution, and the diſeaſe making a haſty progreſs.

" To relate caſes which are nearly, or at leaſt materially ſimilar, is of no uſe: I ſhall therefore only ſay, that every opportunity, which I have had ſince of making the experiment, has ſtill more and more convinced me of the great value and utility of this medicine, and of its power of reſcuing from deſtruction perſons under this affliction.

" I cannot ſay that it has never failed me: it certainly has; but then it has been under ſuch circumſtances, as I think would fairly account for the failure.

" I ſhould be exceedingly ſorry to be miſunderſtood; I ſhould be ſtill more ſo to miſlead any body; and therefore I beg it may be noticed, that I do not propoſe the extractum thebaicum, in this caſe, as an univerſal, infallible ſpecific; I know, from experience, that it is not; but as I alſo know, from repeated experience, that it will, under proper management and direction, do more than any, or than all other medicines; and that I have, by means of it, ſaved ſome lives, which, I am very ſure, would, under the common, and moſt approved method of treatment, without it, have been loſt, I could not anſwer to myſelf the not communicating what I had obſerved.

" If this was an experiment, in which the life or limb, or health of the patient, was in any degree endangered, or by which the perſon, on whom it may be tried, could, in any degree, be injured, I ſhould have withheld what I now publiſh, until a greater length of time, and more experience had rendered it ſtill more abſolutely certain; and I ſhould have thought myſelf ſtrictly vindicable in ſo doing: but as this is a medicine, whoſe general effects are well known, and which is, at the ſame time, ſo capable of direction and management, that it is almoſt impoſſible for any perſon who deſerves to be truſted with medicine at all to do any material harm with it, I thought it would be wrong and unjuſt to conceal what had occurred to me, leſt I might thereby deprive the afflicted of an aſſiſtance which, I verily believe, is not to be obtained from any other quarter.

" In ſhort, from what I have ſeen and done, I am perfectly convinced that, by its means, and by its means ſolely, I have ſaved lives which, without it, muſt have been loſt.

" If it preſerves a few of thoſe, who are ſo unfortunate as to labour under this naſty, painful, lingering, and deſtructive diſorder, to which we are all liable, and which has hitherto, moſt frequently, foiled all attempts of art, I ſhall be ſincerely glad to have contributed to ſo good an end: if it ſhould prove in other hands as ſucceſsful as it has with me, I ſhall be ſtill more ſo; but, on the other hand, if, after ſeveral times giving me reaſon to believe and hope that it would prove an inſtrument for the preſervation of many, it ſhould, upon more repeated trial, be found to fail, I ſhall be ſorry for the event, but ſhall ſtill think, that I did right in communicating what I had ſeen, and thereby endeavouring to be uſeful to mankind.

" Hoc opus, hoc ſtudium, parvi properemus et ampli,
Si patriæ volumus, ſi nobis vivere cari."

" If I am right in my conjecture concerning this hazardous and deſtructive malady; and if the method which I have propoſed and practiſed ſhould prove as ſucceſsful in the hands of others as it has in mine, I cannot help thinking, that the external or chirurgic treatment of the diſorder might be amended; that is, might be made to coincide more than it does at preſent with ſuch ſoothing kind of plan.

" Since I have had reaſon to embrace this opinion, and to act in conformity to it, I have found more advantage from frequently ſoaking the foot and ankle in warm milk, than from any ſpirituous, or aromatic fomentations whatever; that is, I have found the one more capable of alleviating the pain, which ſuch patients almoſt always feel, than the other; which circumſtance I regard as a very material one. Pain is always an evil, but, in this particular caſe, I look upon it as being ſingularly ſo. Whatever heats, irritates, ſtimulates, or gives uneaſineſs, appears to me always to increaſe the diſorder, and to add to the rapidity of its progreſs; and, on the contrary, I have always found, that whatever tended merely to calm, to appeaſe, and to relax, at leaſt retarded the miſchief, if it did do no more.

" The whole plan of the chirurgic treatment of this diſeaſe is founded on a general idea of warming, invigorating, ſtimulating, and reſiſting putrefaction; and the means generally made uſe of are very proper for ſuch purpoſe: but I muſt own that I think the purpoſe, or intention, to be improper.

" Upon this principle, the whole theriaca Londinenſis, and the preſent cataplaſma è Cymino, have been, and ſtill are, ſo freely uſed on this occaſion. A compoſition of this kind, if it does any thing, muſt heat and ſtimulate, and it is by heating and ſtimulating the ſkin, to which it is applied, that it ſo frequently does that miſchief which I am confident it often does, though ſuch miſchief is ſet to the account of the nature of the diſorder. Caſes exactly ſimilar, in all circumſtances, are not to be met with every day, but I am from experience convinced, that of two, as nearly ſimilar as may be, in point of pain, if the one be treated in the uſual manner, with a warm, ſtimulating cataplaſm, and the other only with a poultice made of the fine farina ſeminis lini, in boiling milk or water, mixed with ung. ſambuc. or freſh butter, that the pain, and the progreſs of the diſtemper, will be much greater and quicker in the former than in the latter.

" When the black or mortified ſpot has fairly made its appearance on one or more of the toes, it is the general practice to ſcarify or cut into ſuch altered part with the point of a knife or lancet. If this inciſion be made merely to learn whether the part be mortified or not, it is altogether unneceſſary, the detachment of the cuticle, and the colour of the ſkin, render that a decided point: if it be not made quite through the eſchar, it can ſerve no purpoſe at all; if it be made quite through, as there is no confined fluid to give diſcharge to, it can only ſerve to convey ſuch medicines as may be applied for the purpoſe of procuring digeſtion to parts capable of feeling their influence, and on this account they are ſuppoſed to be beneficial, and therefore right.

" When the upper part of the foot begins to part with

its cuticle and to change colour, it is a practice with many to ſcarify immediately; here, as in the preceding inſtance, if the ſcarifications be too ſuperficial, they muſt be uſeleſs; if they be ſo deep as to cauſe a ſlight hemorrhage, and to reach the parts which have not yet loſt their ſenſibility, they muſt do what indeed they are generally intended to do, that is, give the medicines, which ſhall be applied, an opportunity of acting on ſuch parts.

"The medicines moſt frequently made uſe of for this purpoſe are, like the theriaca, choſen for this ſuppoſed activity; and conſiſt of the warm, pungent oils and balſams, whoſe actions muſt neceſſarily be to ſtimulate and irritate: from theſe qualities they moſt frequently excite pain, which, according to my idea of the diſeaſe, is diametrically oppoſite to the proper curative intention; and this I am convinced of from repeated experience.

"The dreſſings cannot conſiſt of materials which are too ſoft and lenient, nor are any ſcarifications neceſſary for their application. But I would go farther and ſay, that ſcarifications are not only uſeleſs, but, in my opinion, prejudicial, by exciting pain, the great and chiefly to be dreaded evil in this complaint. The poultice ſhould be alſo ſoft, ſmooth, and unirritating; its intention ſhould be merely to ſoften and relax; it ſhould comprehend the whole foot, ankle, and part of the leg; and ſhould always be ſo moiſt or greaſy as not to be likely to become at all dry or hard between one dreſſing and another.

"I will trouble the reader with only one remark more.

"When the toes are, to all appearance, perfectly mortified, and ſeem ſo looſe as to be capable of being eaſily taken away, it is in general thought right to remove them. However rotten and looſe they may ſeem to be, or really are, yet while they hold on they hold by ſomething which is ſtill endued with ſenſation, as may always be known, if they be bent back or twiſted with any degree of violence.

"I will not enter into a diſpute about the ſenſibility or inſenſibility of ligaments, nor undertake to determine whether they be ligaments or any other kind of parts, which ſtill maintain the connection of the toes with their own reſpective joints, or with the metatarſal bones; it is ſufficient for me to know, and to inform the young practitioner, that however looſe they may ſeem, yet if they be violently twiſted off, or the parts, by which they hang, be divided, a very conſiderable degree of pain will moſt commonly attend ſuch operation, which therefore had much better be avoided; and that I have ſeen this very pain, thus produced, bring on freſh miſchief, and that of the gangrenous kind.

"If the patient does well, theſe parts will certainly drop off; if he does not, no good can ariſe from removing them." Pott's Chirurgical Works.

Opium has been acknowledged by many other authors beſides Mr. Pott to be an exceedingly efficacious medicine in all caſes of gangrene accompanied with much irritation. Indeed, while bark is only proper in a limited number of inſtances, opium is indicated in all, either with a view of appeaſing pain, allaying irritation, procuring ſleep, or preventing diarrhœa.

Mr. Kirkland thought, that when opium is preſcribed, the medicine ſhould not be puſhed at firſt, as he believes more harm than good ariſes when the doſes are ſuch as to impair the appetite, occaſion affections of the heart, or delirium.

Camphor is a medicine not to be forgotten in caſes accompanied with irritation and debility. The celebrated Pouteau had a high opinion of its virtues in ſuch inſtances, and he uſed to order five grains to be taken with ten of nitre, every four hours.

Carbonic acid gas has alſo gained conſiderable repute for its beneficial effects in caſes of gangrene and ſphacelus. It has ſometimes done good when bark has failed. Water, impregnated with the gas, is a very eligible beverage for patients labouring under theſe complaints.

We have only to add, on the ſubject of the internal treatment of mortifications, that, in all theſe caſes, a good ſupply of freſh air and the ſtricteſt obſervance of cleanlineſs are of the higheſt importance to the health and recovery of the patient. A few particulars neceſſary to be ſtated concerning the treatment of mortifications from cold and preſſure, may very well be noticed in ſpeaking of the topical means.

Local treatment of Gangrene and Sphacelus.—There can be no doubt that the extent of the deſtruction about to take place in the parts during the gangrenous ſtage may always be conſiderably influenced by the kind of treatment purſued at this period of the diſorder. Hence, it behoves the practitioner, above all things, to find out, if poſſible, the cauſe of the miſchief, and, if he can, remove it as ſpeedily as poſſible. So, when the mortification appears to originate from violent inflammation, he muſt uſe every means in his power to remove this latter affection of the ſurrounding parts, which are ſtill alive, and on the point of being deſtroyed. The local treatment, like the conſtitutional, ought in theſe circumſtances to be of the antiphlogiſtic deſcription. It matters not what is applied to ſuch parts as are already dead; but it is of material conſequence that nothing irritating be put on thoſe which are living and in a high ſtate of inflammation. We ſhould be inclined on principle to make uſe of cold applications in preference to warm ones, and perhaps the lotio aquæ lithargyri acetati is as good as any other.

Mr. Hunter was of opinion that all the local applications ſhould be cold; but we know that there are practitioners who are averſe to this method, and provided they employ nothing ſtimulating, and only uſe moderately warm fomentations and emollient poultices, we cannot find much fault with them. It is a fact which cannot always be reconciled to theories, that in ſome caſes of inflammation the patient derives moſt relief from warm emollient applications; in others from cold ones.

When the ſurrounding inflammation is at an end, and the limits of the mortification are fixed, a ſoft linſeed poultice, containing ſome powdered charcoal, is an excellent application.

We have adviſed the ſurgeon to endeavour to diſcover the remote cauſe, and remove it if poſſible. When the diſorder is owing to preſſure of any kind, nothing avails without removing the occaſion of the ſloughing, and even ſuch removal may be too late to be of much ſervice. In this inſtance the chief means of preventing an increaſe of miſchief are to change the patient's poſture, and put cuſhions under him wherever they are likely to take the preſſure off the parts which are affected. In this ſort of caſe we have generally uſed a ſoft linſeed poultice or a ſimple pledget, as a topical application, though ſome ſurgeons prefer bits of lint dipped in ſpirit of wine.

Tight bandages ſometimes occaſion gangrene, and we need hardly ſay, that their removal is the very firſt indication.

Violent inflammation and gangrenous ſymptoms are ſometimes the conſequence of the expoſure of the parts affected to certain degrees of cold. Theſe evils are particularly apt to follow when the parts have been ſuddenly warmed. Experience has repeatedly evinced, that caloric ſhould always be communicated to frozen parts very gradually. Even when a part, which is not actually frozen, but exceſſively

cold, is all on a ſudden placed in a very warm ſituation, it is found that conſiderable inflammation and ſloughing will frequently follow. The part becomes affected with ſwelling, a livid diſcolouration, and intolerable darting pain.

In order to reſtore warmth to a part which is either in a frozen, or exceſſively cold ſtate, the ſafeſt plan is to rub it with ſnow or very cold water, until ſigns of ſenſe and motion return, when the frictions may be made with brandy, or camphorated ſpirit of wine. The next object is to throw the patient into a perſpiration, which is to be fulfilled by adminiſtering ſome mulled wine, putting the patient to bed in a chamber where there is a fire, and covering him well with blankets. When the inflammatory and gangrenous ſymptoms have already begun, in conſequence of the part having been ſuddenly warmed, the miſchief often admits of being ſtopped by immerſing the part in water of a temperature nearly as low as the freezing point. This method ſhould be perſiſted in for a conſiderable time.

When the effects of cold terminate in a ſphacelus, the local treatment, as well as the general, is not attended with any particularity. An emollient poultice is commonly the beſt application, until the ſloughs have been detached, when the ſores ſhould be dreſſed, according to the principles to be explained in the articles ULCER and WOUNDS.

When a gangrene has proceeded to the ſtate of ſphacelus, ſome practitioners are in the habit of applying the cataplaſma cereviſiæ, or the cataplaſma effervescens. The firſt is prepared by ſtirring into the grounds of ſtrong beer as much oatmeal as will make the maſs of a proper conſiſtence. The ſecond is made by ſtirring into an infuſion of malt as much oatmeal as will render the maſs ſufficiently thick, and then adding about a ſpoonful of yeaſt. The charcoal poultice we have already mentioned as a favourite application. Bark has alſo been topically uſed, from a ſuppoſition of its being a powerful antiſeptic.

We may remark, however, that the linſeed poultice is made uſe of in moſt inſtances, and perhaps anſwers as well as any other in every caſe.

The ancients uſed to endeavour to ſtop the ſpreading of mortifications, by applying the actual cautery to the parts affected. This barbarous method was adopted in all ages, from the time of Hippocrates down to the beginning of the eighteenth century, when ſcarifications and other plans had failed. "Illi affectus qui medicamentis non ſanantur, ferro ſanantur; qui ferro non ſanantur, igne ſanantur; qui igne non curantur, hos exiſtimare oportet inſanabiles." This memorable aphoriſm, which Hippocrates left behind him, relating to the efficacy of fire, brought the cautery into uſe upon almoſt every occaſion. It was believed, as Mr. Sharp obſerves, that in mortifications the putrefying principle, or venom, was extracted with the juices, which were dried up by the hot iron. It was alſo fancied, that the ſeparation of the ſloughs was exceedingly aſſiſted by this proceſs; and, what was more important, it was imagined, that the life of the part was quickened by drawing the ſpirits to it, and freeing it of all humidities. Such was the language of the old ſurgeons.

It is well remarked by Mr. Sharp, that we have hardly in ſurgery a more extraordinary inſtance of human fallibility than this; for, after an uninterrupted practice of above two thouſand years, this celebrated remedy, whoſe virtues were ſuppoſed to be evident both from reaſon and experience, is at length fallen into diſrepute, and never employed for ſtopping a gangrene. See Critical Enquiry, &c.

We have expreſſed a general preference to emollient applications in caſes of mortification, and have alſo taken notice of the charcoal, fermenting, and oat-meal poultices, as ſometimes being proper. We may likewiſe enumerate the carrot and cicuta poultices as having been occaſionally thought ſerviceable in caſes of gangrenous ulcers. Of the practice, however, of employing very ſtimulating applications, we cannot refrain from declaring our decided diſapprobation. It was with ſome diſguſt that we read the directions of a modern writer and lecturer, when he ſays, that "the ſurrounding parts may be invigorated by the application of alcohol, oil of turpentine—cataplaſms containing theriaca Londinenſis, &c." This precept reminds us of the habit of a certain practitioner, who, whenever he had a patient with the facies Hippocratica, uſed to pour down the dying fellow's throat a glaſs of brandy, by way of a final effort to ſave him. However, to diſmiſs all anecdote from this ſerious ſubject, the practice of employing hot ſtimulating applications in theſe caſes is one of thoſe pernicious abſurdities into which our forefathers fell, and which, it ſeems, ſtill continue to prejudice ſome of our cotemporaries. It is only neceſſary to add, with regard to topical ſtimulants, in caſes of mortification, that to all ſurgeons who have imbibed the principles of their profeſſion, under the able lecturers at the great hoſpitals of this metropolis, our admonition not to imitate ſuch practice will be needleſs.

The ancients knew, as well as the moderns, that it was of no conſequence what they put on the ſloughs and mortified parts. Hence, when the mortification extended to any depth, they were always very anxious, that their invigorating, ſtimulating, warm applications ſhould extend their action to the ſubjacent and ſurrounding living fleſh. It was principally with this view that they uſed to make deep inciſions and ſcarifications in the ſphacelated part. They alſo believed, that the practice was of uſe both in giving exit to collections of ſanies under the ſloughs, and putting the living parts into a leſs ſtrangulated condition. The old writers likewiſe adviſe us to cut to the quick, as the only means of making the blood and ſpirits return to the place which they have abandoned.

We will not ſay, that a ſurgeon can never have an opportunity of cutting through a ſlough, and letting out ſome ſanies, to the relief of his patient; but we will venture to declare, that the making of inciſions and ſcarifications is generally wrong and hurtful. If only the dead parts are touched, we confeſs no harm can ariſe; but if the wound is carried down to the quick, pain, bleeding, and a renewal of the ſloughing, will be frequent conſequences of ſuch imprudent irritation. According to the principles which brought the practice into vogue, the inciſions will anſwer no end, unleſs they extend through the dead parts, for they will not enable the applications to get to the quick, nor will they ſerve to give exit to the ſanies underneath. Now, unleſs it ſo happens, that there is a large collection of matter under the ſlough, (which will not often happen,) the cutting inſtrument will wound the living parts, excite great irritation, and often bring on ſerious and fatal conſequences. Wiſeman, though an advocate for ſcarifications, is candid enough to own, that he has ſeen the gangrene increaſed, in conſequence of the tendons being wounded. (See vol. ii. of his works.)

Since we place no confidence in the invigorating power of topical ſtimulants, we have no occaſion to take any meaſures for extending their action to the living parts, and, conſequently, do not ſee the utility of ſcarifications. We are not ſo prejudiced, however, that we would not make a cut through a ſlough, if we were to ſee that, by ſo doing, we might uſefully diſcharge any material quantity of confined ſanious matter. At the ſame time, we would uſe our utmoſt caution not to injure the ſubjacent living parts. As the principles which led to the common practice of ſcarifications

are now exploded, it becomes unneceſſary to take up more of the reader's time in endeavouring to prove the bad effects of this proceeding.

When a ſphacelus has ceaſed to extend its limits, it will be ſome time before the ſurgeon can remove the ſlough, owing to the coheſion which ſtill ſubſiſts between the dead and living parts. The ſeparation, as we have already explained, is the work of nature, the proceſs being chiefly effected by the abſorbent veſſels, which take away the particles of matter, that form the bond of connection between the dead maſs and the living fleſh. It often happens, however, when a ſlough is large, that a portion of it will be looſe and fit for removal much ſooner than the reſt. In this circumſtance, it is proper to cut the looſe portion off, and take it away, for the ſake of cleanlineſs, and in order to diminiſh as much as poſſible the fetid effluvia in the room, which are highly detrimental to the patient's health. The ſame reaſons ſhould always make us vigilant to remove all the dead putrid matter as ſoon as it can be done without irritation or pain.

When the whole thickneſs of a limb is mortified, the patient might ſometimes get quite well by a natural proceſs; the ſloughs being thrown off, and the end of the remaining part of the limb healing up. Experience has proved, however, that when a ſphacelus has proceeded thus far, it is generally beſt to perform amputation "as ſoon as the mortification has evidently ſtopped, and a line of ſeparation can be diſcerned between the dead and living parts." The reaſons for the operation are, to give the patient a ſtump, with which he can uſe a wooden leg, and have the enjoyment of locomotion; to expedite his recovery; and to leſſen his ſufferings. Were amputation not executed, it would be a long while before all the ſloughs and exfoliations could come away; many inciſions would be neceſſary to extract all the pieces of dead bone, and open abſceſſes; and, after all the pain and confinement, the patient would not have a ſtump which could bear the leaſt preſſure, without becoming diſeaſed.

It will be noticed, that a particular ſtreſs is laid on the direction not to amputate before the mortification has ceaſed to ſpread. This rule is of the higheſt importance; for were the operation done ſooner, the ſtump would often become affected with gangrene, and the patient's death be accelerated.

When the old ſurgeons failed in their endeavours to ſtop a mortification, the famous maxim of "enſe recidendum," &c. was invariably followed, and, as Mr. Sharp remarks, the immediate proſpect of inevitable death, without this remedy, always prevented the leaſt doubt of its propriety; but (ſays this valuable writer) time has at length produced in this caſe a moſt remarkable revolution. The ſpreading of a gangrene, which was formerly eſteemed the ſtrongeſt motive for amputation, has now become an argument againſt it; and the moſt eminent ſurgeons always defer amputation till the gangrene has ſtopped, and ſometimes till the dead parts have advanced in their ſeparation.

The reaſon of this extraordinary change in practice is the amazingly ill ſucceſs which has attended the operation under the circumſtance of a ſpreading gangrene. Mr. Pott aſſures us, in his remarks on amputation, that he has often ſeen the experiment made of cutting off a limb in which gangrene had begun to ſhew itſelf, but never ſaw it ſucceed, and it invariably haſtened the patient's death. The cauſe of ſuch bad conſequences is imputed by authors to the impoſſibility of knowing how far the tendency to mortification reaches up the limb, and it is certain that ſuch diſpoſition frequently extends where there is no viſible alteration to excite the leaſt ſuſpicion. In many inſtances, a certain portion of the body ſeems deſtined to periſh, in ſpite of every proceeding on the part of the ſurgeon; and, ſhould he chance to amputate juſt below the unknown line, where the gangrene would ſpontaneouſly terminate, the ſtump itſelf muſt mortify. As there is never in any caſe any criterion by which we can judge where the gangrene will ſtop, it follows that we can never prudently determine where to amputate.

Generally ſpeaking, the operation ſhould be done when the mortification has ceaſed to ſpread, and a red line can be ſeen on the living edge, denoting the commencement of the ſeparation. However, there are inſtances in which the operation ſhould be poſtponed longer. We have ſeen in hoſpitals ſome patients with the ſubſtantial part of the lower portion of their leg in a ſphacelated ſtate, and the detachment complete, except with regard to the bones. Some of theſe patients were ſo reduced, that amputation, immediately performed, might have made them ſink under the hands of the operator. Neither was there now any urgency for the operation; the living ſurface was covered with healthy granulations, the diſcharge was moderate, and the dead maſs, being dry and covered with ſpirit of wine, which was not allowed to come into contact with the living fleſh, the fetid exhalation was not exceſſive. This grievance alſo can always be diminiſhed by taking care to let plenty of freſh air into the patient's chamber. We have ſeen ſome of theſe patients, after a ſhort time, and under a liberal allowance of wine, porter, and nouriſhing food, with bark, cordials, &c. regain a degree of ſtrength that was really ſurpriſing. The operation then admitted of being done under more advantageous circumſtances than at an earlier period. We entertain no doubt, that, in many of theſe inſtances, the patients would get quite well without amputation. The bones would exfoliate, and the extremity of the limb heal. But, we have before ſtated, that the cure in this way would be very tedious, and the ſtump unfit for bearing the leaſt preſſure, ſo that the motives for the operation are ſtill ſtrong and weighty.

Although we have explained that amputation cannot prudently be undertaken after a gangrene has begun, and while it is ſpreading, yet every practitioner ſhould know that the operation ought frequently to be performed before the mortification has had time to begin at all. There are many external injuries, ſuch as bad gun-ſhot wounds, lacerated wounds, ſhattered compound fractures, &c. which will inevitably bring on mortification, or which at leaſt will do ſo in nine caſes out of ten. In ſuch examples amputation ſhould be performed in the firſt inſtance, the wound of the operation being infinitely leſs dangerous than an extenſive ſphacelus.

GANGU, in *Geography*, a town of Africa, in Bambarra. N. lat. 13° 51'. W. long. 4°.

GANGUE, in *Mining*, ſignifies the matrix of ores, or the matter ſurrounding the ore in a mineral vein: it is uſually ſpar of ſome kind, and is often called vein-ſtuff, or deads. See VEIN.

GANHEIM, in *Geography*, a town of Germany, in the principality of Wartzburg; ſix miles N.W. of Volckach.

GANI, *Diamond Mine of*. See DIAMOND.

GANJAM, a town of Hindooſtan, in the circar of Cicacole, near the bay of Bengal. It is ſituated on an eminence, near a river that is not navigable, about a mile within the bar. It has a pagoda, dedicated to an obſcene deity. N. lat. 19° 22. E. long. 85° 20'.

GANIL, in *Mineralogy*. This word, which in the Iriſh

language purports lime-ſtone in the form of ſand, is applied by Mr. Kirwan to the third family of his firſt claſs of the calcareous genus. Its colour is deſcribed as yellowiſh white. Luſtre reflected only from a few ſhining particles. Tranſlucent on the edges. In the lump it cannot be broken but by a hammer; but ſmall pieces of it fritter between the fingers. Specific gravity 2.742. Phoſphoreſces when ſcraped with a knife in the dark. Contains 47 per cent. of carbonic gas, and is almoſt entirely ſoluble in nitrous acid.

It is found on the ſhores of Rhaghery, a ſmall iſland of the coaſt of Antrim. Mr. Kirwan mentions the neighbourhood of Veſuvius and mount Gothard as localities of the ſame foſſil; whence it is probably the ſame with that variety of granular lime-ſtone which has obtained the name of *Dolomite*. See DOLOMITE.

GANISTER, otherwiſe crowſtone or galliard, of which we have given an account under the article CROWSTONE, is a ſtone which, although it has the appearance of a fine-grained and very hard grit-ſtone, and is admirably adapted to the repairing of roads when broken ſufficiently ſmall, nevertheleſs contains ſo large a portion of alumine as to aſſimilate with the valuable fire-clay from whence it is dug, at Birkin-line in Aſhover, Crook's-moor in Sheffield, and other places in and near Derbyſhire; and it has recently been applied, when pounded very fine and kneaded with water, to make (without the addition of clay or other ſubſtances) the beſt crucibles for the Sheffield ſteel-makers' uſe of any which they have been able hitherto to procure. This fact is not merely intereſting to the metallurgiſt, and thoſe who want veſſels to ſtand very intenſe degrees of heat, but has alſo ſome geological importance, in further generalizing the fact, diſcovered by Mr. Farey in his recent examination of about 500 collieries in and around Derbyſhire (ſee Philoſophical Magazine, vol. xxxv. p. 421), mentioned under our article FLOOR *of Coals*: crowſtone or ganiſter being the only durable ſtone or rock on which a ſeam of coals immediately reſts, in all this extenſive diſtrict, or in any other collieries which have fallen under that gentleman's obſervation, or been the ſubject of his inquiries; ſince it now appears, that even this hard and durable ſtone, when mechanically reduced to a plaſtic ſtate, ſuch as all the clunches and other hard floors or hills of coal ſoon acquire by expoſure to the air and rain, has the ſame properties of an infuſible fire-clay which diſtinguiſh the floors of coal-ſeams, perhaps in this and every other part of the world.

GANKA, in *Geography*, a town of Arabia, in the province of Oman; 124 miles S. of Maſcate.

GANKU, a town of China, of the third rank, in the province of Se-tchuen; 12 miles W. of Ho.

GAN-NAN, a town of China, of the third rank, in Koei-tcheou; 35 miles E. of Pou-ngan.

GANNAT, a town of France, and principal place of a diſtrict, in the department of the Allier; 27 miles S. of Moulins. The place contains 5043, and the canton 12,521 inhabitants, on a territory of 192½ kiliometres, in 12 communes. N. lat. 46 6'. E. long. 3° 16'.

GANNELOR, a ſmall iſland in the gulf of St. Laurence, in N. lat. 48°, near Bird iſland.

GANNEMIE, a town of Arabia, 28 miles N.W. of Dsjebi.

GANNET, in *Ornithology*. See PELECANUS *Baſſanus*.

GANNET *Iſland*, in *Geography*, a ſmall iſland near the north coaſt of New Zealand, in the ſouth Pacific ocean, ſo called from the number of gannets that were ſeen to fly about it. S. lat. 37° 57'. W. long. 184° 46'.

GANNING, a town of China, of the ſecond rank, in Yun-nan. N. lat. 25°. E. long. 102° 16'.

GANOR, a town of Hindooſtan; 40 miles N.N.W. of Delhi.

GANOS, a town of European Turkey, in Romania, on the ſea of Marmora; 32 miles N. E. of Gallipoli. N. lat. 40° 48'. E. long. 27° 13'.

GAN-PIN, a town of China, of the third rank, in Koei-tcheou; 20 miles N.E. of Ngan-chun.

GAN-PING, a town of China, of the third rank, in Petche-li; 12 miles N. of Ching.

GANSIGNI, a town of Hindooſtan, in the circar of Aurungabad; 32 miles E S.E. of Aurungabad.

GANT, a town of Germany, in the Tyroleſe; ſeven miles W.N.W. of Landeck.

GANTINGA, a town on the eaſt coaſt of the iſland of Celebes. N. lat. 0° 14'. E. long. 122° 6'.

GANTLET, or GAUNTLET, a large, ſtrong glove, made to cover the arm, or hand, of a cavalier, armed at all points.

The word is derived of the French *gantelet*; and that from *gand*, *gant*, *glove*.

The ganntlet was of iron, and the fingers plated. The caſk and gauntlets were always borne in the ancient marches in ceremony. Gauntlets were not introduced till about the thirteenth century.

The gantlet was frequently thrown, like the glove, by way of challenge.

GANTLET, in *Surgery*, is a kind of bandage for the hand, being a ſwathe, four or five yards long, wherewith they wrap up the hand, and all the fingers, one after another.

GANTLOPE, a military puniſhment. See *Military* EXECUTION.

GANTLOPE, or *Gauntlope*, vulgarly pronounced *gauntlet*, is a puniſhment for felony, or ſome other heinous offence, in a ſhip of war. For this purpoſe, the whole ſhip's crew is diſpoſed in two rows, ſtanding face to face on both ſides of the deck, ſo as to form a lane, whereby to go forward on one ſide, and return aft on the other; each perſon being furniſhed with a ſmall twiſted cord, called a knittle, having two or three knots upon it. The delinquent is then ſtripped naked above the waiſt, and ordered to paſs forward between the two rows of men, and aft on the other ſide, a certain number of times, rarely exceeding three; during which every perſon gives him a ſtripe as he runs along. This puniſhment, which is called "running the gauntlet," is ſeldom inflicted, except for ſuch crimes as will naturally excite a general antipathy among the ſeamen.

GANUARA, in *Geography*, a town of Hindooſtan, in Golconda; 10 miles N. of Hydrabad.

GAN-YE, a town of China, of the third rank, in Se-tchuen; 10 miles W. of Ho.

GANYMEDE, Γανυμηδης, a term lately come in uſe to expreſs a catamite, or bardacio. See SODOMY.

The expreſſion takes its riſe from a young beautiful Trojan ſhepherd, thus called, whom Jupiter raviſhed, or carried off, by his eagle, or rather by himſelf, under the figure of an eagle, as he was hunting upon mount Ida; and made him his cup-bearer, in the place of Hebe; who, having made a falſe ſtep, and ſpilt her liquor, was turned out of that office.

Some ſay, that the Jupiter who raviſhed Ganymede was Tantalus, king of Phrygia; the eagle expreſſed the ſwiftneſs wherewith he was carried off.

The ſtatue of Ganymede was tranſported from Greece to Rome, and ſet up in the temple of Peace; and to this Juvenal refers, when he ſays,

"Nuper enim repeto fanum Iſidis, et Ganymedem hic facis."

GAOGA, in *Geography*, a country of Africa, W. of Nubia, with a town of the ſame name, ſituated on a large lake. The inhabitants are ſaid to be barbarous and uncivilized. N. lat. 16°. E. long. 26°.

GAOL, a priſon, or place of legal confinement.

The word is formed of the French *geole*; and that of the barbarous Latin *geola*, *gaola*, *gayola*, a *cage*; whence the Picards ſtill call a bird-cage *gayolle*. The gaoler, geolier, was called *gaularius* and *cajularius*. Scaliger derives the word *gaoler* from *janicularius*. And ſome Latin authors call him *commentarienſis*, becauſe he keeps a regiſter, or liſt, of all thoſe under his cuſtody.

Every county hath two gaols; one for debtors, which may be any houſe where the ſheriff pleaſes; the other for the peace and matters of the crown, which is the county gaol.

By 22 and 23 C. II. c. 20. the gaoler ſhall keep debtors and felons ſeparate, on pain of forfeiting his office, and treble damages to the party grieved; and by 31 G. III. c. 46. tranſports are to be kept ſeparate from other priſoners. As the gaol is intended, in moſt caſes, for cuſtody, and not for puniſhment, it is enacted by 14 Geo. III. c. 59. that the juſtices, in their ſeveral quarter ſeſſions, ſhall order the walls and ceilings of the ſeveral cells and wards, both of the debtors and felons, and of any other rooms uſed by the priſoners in their reſpective gaols, where felons are uſually confined, to be ſcraped and whitewaſhed once in the year at leaſt, and to be regularly waſhed and kept clean, and conſtantly ſupplied with freſh air by hand ventilators or otherwiſe; and ſhall order two rooms in each gaol, one for the men and another for the women, to be ſet apart for ſick priſoners; and order a warm and cold bath, or commodious bathing-tub, to be provided in each gaol, and direct the priſoners to be waſhed in ſuch warm or cold baths, or bathing-tubs, &c.; and they ſhall appoint an experienced ſurgeon or apothecary, at a ſtated ſalary, to attend the gaol, and to report, at each quarter ſeſſions, the ſtate of the health of the priſoners; order clothes for the priſoners when they ſee occaſion, prevent their being kept under ground when it can be done conveniently, and from time to time make orders for reſtoring or preſerving the health of the priſoners; the expences to be paid out of the county rates, or out of the public ſtock of any city, franchiſe, or place to which the gaols belong. The gaoler is ſubject to fine for neglect or diſobedience of the orders of juſtices, by complaint to the judges of aſſize, or to the juſtices in their quarter ſeſſions. By 31 G. III. c. 46. viſiting juſtices are appointed for inſpecting gaols at leaſt three times in each quarter of a year, in order to prevent abuſes, &c., and they are to report to the quarter ſeſſions. The juſtices in ſeſſions may alſo appoint clergymen to officiate in gaols according to the rites of the church of England, and allow to each a ſalary not exceeding 50*l.* a year, to be paid by the treaſurer of the county-rate. 13 G. III. c. 58.

If a gaol be out of repair, inſufficient, &c. the juſtices of the peace in the quarter-ſeſſions may agree with workmen for rebuilding or repairing it; and by warrant under their hands and ſeals, order the ſum agreed upon to be levied upon the ſeveral hundreds and diviſions in the county, by a proportionate rate; and the juſtices in ſeſſions may borrow, on mortgage of the ſaid rates, any ſum not leſs than 50*l.* nor more than 100*l.* and diſcharge the whole by yearly payments. 11 and 12 W. III. cap. 19. 24 Geo. III. c. 54. See PRISON-*breaking*.

GAOL *Delivery*. See JUSTICES, and OYER and *Terminer*.

GAOL *Fever*. See FEVER, and TYPHUS.

GAOLER, is the maſter of a priſon; one that hath the cuſtody of the place where priſoners are kept. Sheriffs muſt make ſuch perſons gaolers for whom they will anſwer: but if there is a default in the gaoler, action lies againſt him for an eſcape, &c. (2 Inſt. 592. 14 Ed. III. ſt. 1. c. 10. 19 H. VII. c. 10.) In common caſes the ſheriff or gaoler is chargeable, at the diſcretion of the party; though the ſheriff is moſt uſually charged. (Wood's Inſt. 76.) When a ſheriff quits his office, the cuſtody of the county gaol can belong only to his ſucceſſor. 1 L. Raym. 136.

By 8 and 9 W. III. cap. 27. marſhal and warden taking any reward to connive at priſoners' eſcape, forfeits 500*l.* and his ſaid office, and is for ever after incapable of holding ſuch office. The office of marſhal of the king's bench, and warden of the Fleet, ſhall be executed by thoſe who have the inheritance of the ſaid priſons, or their deputies, &c. By 3 Geo. I. cap. 15. no one ſhall purchaſe the office of gaoler, or any other office pertaining to the high ſheriff, under pain of 500*l.*

Where a gaol is broken by thieves, the gaoler is anſwerable; not if it be broken by enemies. (3 Inſt. 52.) If a criminal, endeavouring to break the gaol, aſſaults his gaoler, he may be lawfully killed by him in the affray. (1 Hawk. 71. 1 H. H. 496.) But if the gaoler or his officers, or any perſon aiding him, ſhould fall in the conflict, this will amount to wilful murder in all perſons joining in ſuch reſiſtance. (Foſt. 321.) By 24 G. II. cap. 40. no licence ſhall be granted for ſelling ſpirituous liquors within any gaol or priſon; and if the gaoler ſhall ſell, lend, uſe, or give away, or ſuffer the ſame, except by way of medicine, he ſhall forfeit 100*l.* half to the king, and half, with full coſts, to him who ſhall ſue. Any perſon bringing any ſpirituous liquors into ſuch gaol, may be apprehended by the gaoler or his ſervants, and carried before a juſtice; and upon conviction by the oath of one witneſs or otherwiſe, ſhall be committed to priſon or the houſe of correction for a term not exceeding three months, unleſs he ſhall immediately pay a fine not exceeding 20*l.* nor leſs than 10*l.* at the pleaſure of the juſtice, half to the informer, and half to the poor of ſuch gaol. A copy of theſe clauſes ſhall be hung up in each gaol, on pain of the gaoler forfeiting 40*l.* A gaoler ſhall not ſuffer tippling or gaming in ſuch priſon, nor be licenſed to ſell any wine, ale, or other liquors; nor have any beneficial intereſt or concern in the ſale of any liquors, or in any tap-houſe, tap-room, or tap, on pain of forfeiting 10*l.* for every ſuch offence. The juſtices in their ſeſſions may appoint ſalaries to gaolers in lieu of the profits derived from the ſale of liquors; to be paid out of the county rate. By 14 Eliz. c. 5. and 12 C. II. c. 29. priſoners are to be provided for by a ſum to be paid out of the county rate. (See alſo 31 G. III. c. 46.) By this ſtatute it is enacted, that the juſtices in ſeſſions, or ſpecial adjournment thereof, ſhall regulate and ſettle a table of fees and rates to be taken by gaolers; and ſhall order a copy of the ſame to be hung up in the court of aſſize and quarter ſeſſions, and another copy to be ſent to the gaoler, who ſhall cauſe the ſame to be hung up in ſome conſpicuous place within the gaol; and all orders and directions contained in the act of 32 G. II. c. 28. reſpecting the table of fees to be taken by gaolers, ſhall be conformed to as if the ſame were in this act particularly enacted and repeated. By the ſame ſtatute, the keeper of every gaol ſhall on the firſt day of every aſſize make a return in writing to the clerk of aſſize or other proper officer, and ſhall ſpecify therein the number and ſize of the cells, the names of the priſoners, the offences of which they have been guilty, the court before which every perſon was convicted, the ſentence of the court, if tried and convicted before any court of record, or if committed by a juſtice of the peace, the name of ſuch juſtice, and the offence of

which

which he was convicted, the age, bodily ſtate, and behaviour of every ſuch convict; ſuch return, before it is delivered into court, to be examined and ſigned by one of the viſiting juſtices. A gaoler voluntarily ſuffering priſoners to eſcape ſhall be puniſhed in the ſame manner as the priſoner ought to have been who eſcaped; and if he negligently permit him to eſcape, he ſhall be puniſhed by fine and impriſonment; and the ſheriff ſhall anſwer for him. 2 Hawk. 134, 5, 6. 5 Mod. 415, 416.

The abuſes of gaolers and ſheriffs' officers towards the unfortunate perſons in their cuſtody, are well reſtrained and guarded againſt by ſtatute 32 Geo. II. cap. 28.

Gaolers are not juſtified by law in fettering a priſoner unleſs he is unruly, or has attempted an eſcape. (2 Inſt. 381. 3 Inſt. 34.) The humane language of our ancient lawgivers is; "Cuſtodes pœnam ſibi commiſſorum non augeant, nec eos torqueant; ſed omni ſævitia remota, pietateque adhibita judicia debite exequantur." Flet. lib. i. cap. 26. If the gaoler keep the priſoner more ſtrictly than he ought of right, whereof the priſoner dieth, this is felony in the gaoler by the common law; and hence it is, that if a priſoner die in a gaol, the coroner ought to ſit upon him; and if the death was owing to cruel and oppreſſive uſage on the part of the gaoler, or any officer of his, it will be deemed wilful murder in the perſon guilty of ſuch dureſs. 3 Inſt. 91. Foſt. 321, 2.

GAONS, a certain order of Jewiſh doctors, who appeared in the Eaſt after the cloſing of the Talmud. The word gaons ſignifies *excellent, ſublime*; as in the divinity ſchools we formerly had irrefragable, ſublime, reſolute, angelic, and ſubtile doctors. The Gaons ſucceeded the Seburæans, or Opiners, about the beginning of the ſixth century. Chanan Meiſchtia was the head, and the firſt of the excellents; he reſtored the academy of Pandebita, which had been ſhut up for the ſpace of thirty years.

GAP, in *Rural Economy*, a defect, breach, or opening in a hedge fence. Theſe ſorts of gaps are capable of being repaired in many different ways, according to their nature and circumſtances; but it is in general the beſt done by having recourſe to living plants of the ſame kind as the hedge, and ſuited in ſize to it. See FENCE.

GAP, in *Geography*, a town of France, principal place of a diſtrict, and capital of the department of the Higher Alps. The place contains 8050, and the canton 10,893 inhabitants, on a territory of 200 kiliometres in 7 communes. Before the revolution, it was the ſee of a biſhop, ſuffragan of Aix, and capital of a county called "Gapençois," about nine leagues long and ſix wide; 45 miles S. of Grenoble. N. lat. 44° 34'. E. long. 6° 10'.

GAPSAL, or HAPSAL, a town of Ruſſia, in the government of Revel, on a ſmall gulf of the Baltic; formerly the ſee of a biſhop, and ſubject to the Danes, but in the beginning of the 18th century annexed to Ruſſia, 36 miles W.S.W. of Revel. N. lat. 59° 5'. E. long. 42° 24'.

GARA, a lake of Ireland, in the county of Sligo, on the confines of Roſcommon. It is an extenſive and romantic ſheet of water, not far from the town of Boyle.

GARA, a lake of Egypt; 12 miles S. of Fayoum.

GARACHIO, a town on the weſt coaſt of the iſle of Teneriffe.

GARAFOA, CAPE, a cape on the weſt coaſt of Africa. N. lat. 2° 40'.

GARAGAY, in *Ornithology*, the name of a rapacious bird of Mexico, of the ſize of our kite; its head and the tips of its wings are white; it makes but ſhort flights; it is very fond of the eggs of tortoiſes and crocodiles, and hunts the places where they have buried them in the ſands.

GARAJAM, in *Geography*, a river of Africa, which runs into the Atlantic, N. lat. 3°.

GARAMA, in *Ancient Geography*, a town of Africa, the metropolis of the people called *Garamantes*.

GARAMANTES, the ancient inhabitants of an extenſive diſtrict of Africa, ſituated to the S. E. of Gætulia, and E. of the Nigritæ. Although the limits of their country cannot be preciſely aſcertained, there is reaſon to believe, that it extended to the borders of the Proper Ethiopia, and that it comprehended many large territories. According to Dr. Shaw, ſome of the ancient Garamantes ſpread themſelves over that tract that included the diſtricts of Gad-demz, Fezzan, and ſome of the more diſtant cities and villages of the kingdom of Tripoli. Their country, whatever might be its extent, abounded with wild beaſts; and the inhabitants were ſo ſavage, that they fled at the ſight of a perſon belonging to any other nation. Deſtitute of arms, they made no effort for ſelf-defence, when they were attacked, and they wholly ſecluded themſelves from intercourſe with other people. They ſeem, however, to have gradually advanced to a higher ſtate of ſociety, as they built towns, or rather daſhkras; the principal of which were Garama, near mount Girgiris, and the ſource of the Cinyphus, Debris, and Metelgæ. They alſo aſſociated with a neighbouring people, called the Marmaridæ, and carried on trade with the Carthaginians, Arabs, Perſians, and Ethiopians. Indeed, the caravans of the Carthaginians muſt, in all probability, have paſſed to Carthage from thoſe remote countries, through the ſandy deſerts of the Garamantes: and it has been ſaid that they, as well as the Perſians and Ethiopians, ſupplied the Carthaginians with a great number of valuable gems. Although it appears, by the teſtimony of Herodotus, that the ancient Garamantes were reproached with cowardice, their poſterity ſeem to have been of a different diſpoſition, if we may rely on the accounts given of them by Pliny, Tacitus, and Feſtus Avienus. Some of them roved about the deſerts of Libya like their ſucceſſors the modern Bedoweens; whilſt others inhabited the daſhkras which were diſperſed over thoſe parched and barren plains. The former lived frugally, and ſupported themſelves by hunting. The country of the Garamantes, as well as Nigritia, was probably firſt peopled from Egypt and Ethiopia; and they ſeem to have been the deſcendants of Miſraim and Cuſh, intermixed with ſome colonies of Arabs. The language, or rather languages, ſpoken in theſe regions, bore a great affinity at firſt to the Egyptian, Arabic, and Ethiopic, and at this time may poſſibly be corrupted dialects of theſe tongues. As to their religion, they, in common with the Arabs, Indians, and Ethiopians, worſhipped Jupiter Ammon, repreſenting him with a ram's head, or at leaſt with ram's horns, and had a temple dedicated to him. The women among the Garamantes were uſed promiſcuouſly, ſo that they ſeem to have had no notion of matrimony. In early times they were governed by phylarchs, or heads of tribes, like the Gætulians and Arabs; but in proceſs of time, as we learn from Tacitus, monarchy ſeems to have prevailed among them. Ptolemy indeed aſſerts, that they formed a large and powerful nation, extending themſelves from mount Uſargala to the lake or moraſs Nuba; and yet their affairs are ſcarcely at all recorded in hiſtory. Maſiniſſa, when expelled from his dominions by Syphax, took refuge among them. As the roads to their country from Mauritania were rendered impaſſable by robbers, the Romans had little knowledge of them till after the expiration of the republic. Lucius Cornelius Balba entirely ſubdued them, and for this ſervice Auguſtus granted to him a triumph. Afterwards they ſeized an opportunity of emancipating themſelves from the Roman yoke, as Florus informs us; and we learn from Tacitus, that the

king of the Garamantes joined Tacfarinas, in the reign of Tiberius, againſt the Romans. After the laſt defeat and death of Tacfarinas, they ſent ambaſſadors to Rome to appeaſe the reſentment of Tiberius; which was effected, moſt probably, by their entire ſubmiſſion; ſince it appears probable, that the Roman empire extended on that ſide almoſt, if not altogether, to the northern coaſt of the Niger.

GARAN, in *Geography*, a ſmall iſland in the North ſea, near the N. coaſt of Scotland; 3 miles E. S. E. of cape Wrath. N. lat. 58° 35'. W. long. 4° 45'.

Garan, a town of Candahar, 12 miles from Cabul.

GARAPHAS, in *Ancient Geography*, a maritime town of Africa Propria, according to Ptolemy.

GARAPHI Mons, a mountain of Mauritania Cæſarienſis, to the north of the river Chinalaph. It was S. of Julia Cæſarea, and S. W. of Tipaſa.

GARAPO, Cape, a cape of France, in the Mediterranean, about 6 miles S. of Antibes. N. lat. 43° 31'. E. long. 7° 4'.

GARATIVA, a river of Braſil, which runs into the Atlantic, S. lat. 13°.

GARATRONIUM, in *Natural Hiſtory*, the name of a foſſile body, commonly ſuppoſed the ſame with the bufonites, but very improperly; the only juſt account of it is that of Ferrante Imperato, who tells us that it is a purple ſtone with variegations of a gold yellow, diſpoſed in the manner of the veins of many ſorts of marble; and that the Perſians, and many of the eaſtern people, put it into the handles of their ſabres. It appears by this deſcription to be a kind of jaſper; and is very improperly confounded with the bufonites, a ſmall ſtone fit only to be worn in rings.

GARAY, in *Geography*, a town of Africa, in the kingdom of Cayor, 80 miles S. E. of Amboul.

GARAZA, a town of Braſil, in the province of Pernambuco, 25 miles N. of Olinda.

GARB, in *Britiſh Antiquity*, from the French *garbe, faſcia*, a bundle or ſheaf of corn. See Garbe.

Garb, or *El-Garb*, in *Geography*, a province of Morocco, which begins in the territory of Tetuan, and extends near a degree in length from eaſt to weſt, reaching quite to cape Spartel: its length from north to ſouth is about 36 leagues. It is bounded to the north by the ſtraits of Gibraltar, to the ſouth by the river Mamora, to the weſt by the ocean, and to the eaſt by the kingdom of Fez. The northern part is not very fruitful; as it is interſected with vallies, the lands are liable to be injured by the heavy rains, and the harveſt is very uncertain; the reſt of the province is extremely beautiful; it is watered by ſeveral rivers, and embelliſhed by ſome foreſts.

GARBAN, a town of Candahar, on the Behat; 30 miles N. of Cabul.

GARBE, in *Heraldry*, a repreſentation of a ſheaf of corn, or other grain; ſometimes borne in coat-armour, to ſignify ſummer, or the month of Auguſt; as the bunch of grapes denotes autumn.

Garbe *Dendour*, in *Geography*, a town of Nubia, on the weſt coaſt of the Nile, in which is an ancient temple. The Nile near this place is of moſt difficult navigation; the whole breadth being filled up with rocks under water, and between the rocks with eddies and whirlpools; 60 miles S. of Syene.

Garbe *Dirſche*, a town of Nubia, on the eaſt coaſt of the Nile, in which are ſome ancient ruins; three miles N. of Garbe Dendour.

GARBIA, a diſtrict in the north part of Egypt, between the eaſt and weſt branches of the Nile.

GARBLER *of Spices*, an officer of great antiquity in the city of London, who is empowered to enter any ſhop, warehouſe, &c. to view and ſearch drugs, &c. and to garble and cleanſe them. By ſtat. 6 Ann. c. 16. this officer is to be appointed by the court of lord mayor, aldermen, and common council, to garble ſpices at the requeſt of the owner, but not otherwiſe.

GARBLES, the duſt, ſoil, or filth, ſevered from good ſpice, drugs, &c.

GARBLING of ſpices, drugs, &c. is the cleanſing it from the droſs and duſt, mixed therewith, and ſevering the good from the bad.

The word comes from the Italian *garbellare, to ſhake*.

Garbling *of bow-ſtaves*, is the ſorting or culling out the good from the bad.

GARBO, Il, in *Geography*, a town of Etruria; ſix miles E. S. E. of Leghorn.

GARBOARD-Strake, in a *Ship*, is the firſt ſeam next to the keel.

Garboard-*plank*, the firſt plank faſtened on the keel.

GARCHANSKOI, in *Geography*, a town of Ruſſia, in the government of Tobolſk, on the river Tobol; 80 miles S. of Tobolſk.

GARCIA, a town of Spain, in the province of Catalonia; 18 miles N. of Tortoſa.

GARCIAS-LASSO, or Garcilaso, de la Vega, in *Biography*, an eminent Spaniſh poet, was born at Toledo in 1503. He was the younger ſon of a man of rank, who had been employed in ſome important negociations. Garcilaſo, as a man, was diſtinguiſhed for his wit and bravery, and as a poet, he adopted the ſtyle and manner of his friend Boſcan (ſee his article). His works conſiſt chiefly of paſtorals, ſome of which are very prolix, and in one of them, it is ſaid, he has introduced almoſt action enough for a drama. His principal excellence is tenderneſs, which is frequently diſplayed with great beauty in his ſonnets, of which the reader will be pleaſed with the following ſpecimen tranſlated by Mr. Southey.

"As when a mother, weak in tenderneſs,
Hears her ſick child with prayers and tears implore
Some ſeeming good, that makes his pain the leſs,
Yet, with ſhort eaſe! the future evil more:
Even as her fondneſs yields to his vain will
She haſtes to gratify her ſickly ſon—
Anticipating then the coming ill,
Sadly ſhe ſits, and weeps what ſhe has done.
Thus have I pampered my diſtemper'd mind,
And yielded thus to fancy's wayward mood,
Poor dupe of fancy! ſelf-condemned to find
The future anguiſh in the preſent good.
Thus do I waſte a wretched life away,
And nightly weep the errors of the day."

"Both Boſcan and Garcilaſo poſſeſſed more learning than taſte, and more taſte than genius. Their poems, particularly thoſe of the latter, are full of imitations from the ancients." The poems of Garcilaſo have paſſed through many editions, and commentaries have been written upon them by Sanchez de las Brozas, the moſt eminent of the Spaniſh grammarians. Garcilaſo followed the profeſſion of arms, and attended Charles V. in many of his expeditions. At length he loſt his life in battle, as he was ſignalizing his courage in the preſence of his ſovereign, in an attack on a fortreſs in Provence, in the year 1536. Monthly Mag. Gen. Biog. Moreri.

GARCINIA, in *Botany*, named by Linnæus in commemoration of Laurence Garçin, M. D. F. R. S. who lived in the early part of the laſt century, and viſited the

Eaſt,

Eaſt, where he made ſeveral botanical obſervations, ſome of which are printed in the Philoſophical Tranſactions n. 415, 431, 489, 491. In the place laſt mentioned he eſtabliſhes the genus *Salvadora*, and in n. 431 deſcribes the valuable tree now under conſideration, by its Malay name, *Mangoſtans*. Linn. Gen. 237. Schreb. 319, 831. Willd. Sp. Pl. v. 2. 848. Mart. Mill. Dict. v. 2. Juſſ. 256. Lamarck Illuſtr. t. 405. (Mangoſtana; Gærtn. v. 2. 105. t. 105. Cambogia; Linn. Gen. 263. Schreb. 351. Juſſ. 256.)—Claſs and order, *Dodecandria Monogynia*. Nat. Ord. *Guttiferæ*, Juſſ.

Gen. Ch *Cal.* Perianth inferior, of four roundiſh, concave, obtuſe, ſpreading, permanent leaves. *Cor.* Petals four, roundiſh, concave, ſpreading, rather larger than the calyx. *Stam.* Filaments about 16, erect, collected into a tubular form, ſimple, ſhorter than the calyx; anthers roundiſh. *Piſt.* Germen ſuperior, nearly oval; ſtyle ſcarcely any; ſtigma flat, peltate, ſpreading, in ſix or eight blunt lobes, permanent. *Peric.* Berry coriaceous, globoſe, large, crowned with the ſtigma, of ſix or eight pulpy cells, with membranous partitions. *Seeds* ſolitary, imbedded in the pulp, vertical, ſomewhat elliptical, compreſſed, rugged, with a ſimple embryo.

Eſſ. Ch. Calyx inferior, of four leaves. Petals four. Berry coriaceous, of ſeveral cells, crowned with the ſtigma. Seeds ſolitary.

Obſ. The number of the ſtamens, and of the ſegments of the ſtigma, the latter always agreeing with the number of cells in the fruit, differ in different ſpecies from four to eight, and vary in the ſame from five to eight, according to the obſervations of Gærtner and Juſſieu. The former firſt united *Cambogia* to *Garcinia*, but is highly reprehenſible for the troubleſome and improper change of the Linnæan name to a barbarous one that agrees with only one ſpecies.

1. G. *Mangoſtana*. Linn. Sp. Pl. 635. (Mangoſtana; Rumph. Amboin. v. 1. 132. t. 43. Mangoſtan Apple.)—Branches quadrangular. Leaves ovate; their veins ſomewhat diſtant. Flowers terminal, ſolitary.—Native of the more oriental parts of the Eaſt Indies, as Malacca, Sumatra, and Java. Cultivated with difficulty in ſome few places beſides. *Rumphius*. This is univerſally allowed to be the moſt delicious, as well as moſt wholeſome, of Indian fruits. It reſembles a ſmall orange, of a dark brown colour, full of ſoft ſweet pale-coloured pulp, from which the outer coat eaſily ſeparates, and each of whoſe cells contains a large oval ſeed. The external coat dried is aſtringent, and uſeful in dyſenteries. The pulp may be eaten with ſafety, and in almoſt any quantity, in health or in ſickneſs. Rumphius ſays, it is eſteemed a very bad ſymptom if a patient has no appetite even for the Mangoſtan. The *tree* is about the ſize of a common apple-tree, ſmooth in all its parts, with oppoſite quadrangular branches. *Leaves* oppoſite, five or ſix inches long, ovate, pointed, of a ſhining green, entire, furniſhed with a rather ſlender midrib, from which ſpring irregularly numerous rather diſtant veins. *Foot-ſtalks* three quarters of an inch long, thick. *Flower-ſtalks* terminal, ſimple and ſingle-flowered, an inch long, without bracteas. *Flowers* whitiſh, the ſize of a ſhilling, with yellow ſtamens. The *fruit* ripens uſually in November and December. Mr. Ellis, who was very deſirous of procuring this plant, publiſhed in 1775 a deſcription of it and the bread-fruit, with "directions to voyagers for bringing over theſe and other vegetable productions." There is however little hope of our ever ſeeing the Mangoſtan growing in Europe.

2. G. *celebica*. Linn. Sp. Pl. 635. (Mangoſtana celebica; Rumph. Amboin. v. 1. 134, t. 44.)—Branches roundiſh. Leaves elliptic-oblong; their veins numerous, cloſe, ſtraight and parallel.—Native of the iſland of Celebes, from whence, according to Rumphius, it was brought to Amboyna. We have ſpecimens from the latter place, under the name of Wild Mangoſtan, gathered by the late Mr. Chriſtopher Smith. It appears to differ from the firſt ſpecies in having rounder, or at leaſt not regularly quadrangular, *branches*; more elliptical *leaves*, tapering to each end, whoſe veins are peculiarly numerous, ſtraight and parallel. *Foot-ſtalks* half an inch long, keeled and very deeply channelled. *Flowers* dirty white, fragrant, terminal, about three together, on ſhort thick ſtalks. *Fruit* like the former, but yellower and more acid. Rumphius reports that ſmall pieces of the wood, buried for three years in marſhy rice-grounds, become petrified, and make a ſort of hone, called Kiras-ſtone, after the country name of the tree. The ſame author ſuſpects the Panitsjika, or Lymappel, Rheede Hort. Malab. v. 3. 45. t. 41, to be this ſame plant; but that is unqueſtionably Roxburgh's *Embryopteris glutinifera*. See EMBRYOPTERIS.

3. G. *Cambogia*. Willd. Sp. Pl. v. 2. 848. (Mangoſtana Cambogia; Gærtn. v. 2. 106. Cambogia Gutta; Linn. Sp. Pl. 728. Coddam-pulli; Rheed. Hort. Mal. v. 1. 41. t. 24. Carcapuli; Cluſ. Exot. 286.—Leaves elliptical, acute at each end; their veins rather diſtant. Fruit furrowed. Branches round.—Native of denſe woods, where the ſoil is ſandy, in Malabar. *Rheede*. This is deſcribed as a tall *tree*, with a trunk about four feet in diameter, and a thick widely ſpreading *root*, out of which, when wounded, flows a very viſcid but taſteleſs liquor. The *branches* are round and ſmooth. *Leaves* oppoſite, three or four inches long, elliptical, entire, tapering at each extremity, a little oblique, ſmooth, paler beneath; their lateral veins rather few and diſtant, forming very acute angles with the midrib, connected by reticulations. *Footſtalks* ſlightly channelled. Rheede deſcribes the *flowers* as terminating the young leafy ſhoots, on very ſhort ſtalks, and of a fleſh or roſe-colour, without ſmell. His minute account of their ſtructure well accords with our generic character. The *fruit* is pendulous, on ſtalks an inch long, ſolitary, the ſize of a ſmall orange, but furrowed like a melon, and crowned with tumid crenate remains of the ſtigma; its colour yellow or whitiſh; the flavour of its pulp ſweet with ſome acidity. The cells and ſeeds are ſaid to be 8, 9 or 10. The ſeaſon of flowering and fruiting is March. In a ſpecimen of this tree, ſent by the Rev. Dr. Rottler from the Eaſt Indies, the flower-ſtalks, which are clothed with ruſty down, and near an inch long, grow in pairs from buds juſt below the inſertion of each leaf, and are by no means terminal. Probably they might appear ſo in the early ſtate in which Rheede delineates them, and that appearance might be deſtroyed by the ſubſequent growth of the branches. His deſcription of the leaves is peculiarly exact. Nothing is ſaid in the Hortus Malabaricus to authorize the report of Gamboge being the produce of this tree. Dr. Roxburgh, in the deſcription of his *Xanthochymus pictorius*, Plants of Coromandel, v. 2 t. 196, ſays the full-grown but unripe fruit of that tree produces, when wounded, a copious yellow acrid gum, uſeful in painting, very like *Gummi Guttæ*, or Gamboge, but he gives us no information concerning the origin of the latter. Linnæus received for the *Cambogia* a widely different plant, his own *Aſclepias carnoſa*, Sm. Exot. Bot. t. 70.

4. G. *cornea*. Linn. Syſt. Veg. ed. 13. 368. (Lignum corneum; Rumph. Amb. v. 3. 55. t. 30: not v. 2, as copied by Murray and Willdenow.) – Leaves elliptical, ſomewhat ovate, ſhining; their veins unequal and irregular. Flowers terminal, ſolitary, drooping. Branches quadran-

gular.—Native of the mountains of Amboyna. *Rumphius.* A tall, but not very large *tree*, whoſe ultimate branches are ſhort, tufted, acutely quadrangular, with a ſmooth green bark. *Leaves* oppoſite, in pairs croſſing each other, from eleven to fifteen inches long, and four broad, but on old trees ſhorter; ſmooth, firm, and ſhining, with one thick rib, which is furrowed above and triangular at the back, ſending off many fine tranſverſe veins, not exactly parallel nor united. *Footſtalks* ſhort and thick, ſometimes ſo curved as to render the leaves reſupinate. *Flowers* ſolitary at the end of each branch, on curved ſtalks, of four firm thick yellow petals, ſlightly fragrant. *Fruit* the ſize of a plum, globoſe, brown, even, crowned with the ſtigma which reſembles the head of a nail, full of glutinous pulp, lodging ſemilunar ſeeds. A viſcid liquor iſſues from its coat, as well as from the branches, when wounded, which turns yellow in drying. The wood is extremely hard and horny, white when freſh, but ſoon turning reddiſh or yellowiſh.

We have a Java ſpecimen, marked with the Malay name *Moendoe*, which appears to be what Rumphius means p. 56, by *Munda* of the Malays, and which thoſe people eſteem the ſame with his *Lignum corneum*. Our ſpecimen agrees very exactly with his account as to the leaves, and the extreme hardneſs of the wood, but the flowers are ſmaller, and grow at the baſe of the younger branches. We dare not deſcribe it as a diſtinct ſpecies, becauſe there ſeems to be a myſtery about the inflorescence of this whole genus, which we cannot ſolve for want of an opportunity of tracing its progreſs in a growing ſtate.

5. G. *dioica*. (G. cornea; Roxb. MSS.)—Leaves elliptic-lanceolate, pointed at each end; their veins unequal. Flowers two or three together, drooping, dioecious. Branches round.—Native of the Eaſt Indies, communicated to us by lord viſcount Valentia from the Calcutta garden. The *branches* are ſlender, numerous, oppoſite, very ſlightly angular when young only. *Leaves* two or three inches long, elliptic-lanceolate, entire, pointed at each end, opaque, their veins rather numerous, but very unequal, irregular and ſubdivided. *Footſtalks* angular, channelled. *Flowers* either at the ends, or about the lower part, of the young branches, two or three together, on ſhort angular drooping ſtalks, each about the ſize of a hawthorn bloſſom; male on one tree, female on another. The latter ſeem to have the ſhorteſt ſtalks, and of three at the end of a branch in our ſpecimen, one only is fruitful, having the germen ſwelled to the ſize of a black currant, with a large, tumid, lobed and wrinkled ſtigma. We cannot find any figure or deſcription applicable to this ſpecies, unleſs it be the following. It does not at all agree with the preceding.

6. G. *Morella*. (Mangoſtana Morella; Gærtn. v. 2. 106. Kannawakoraka; Herm. Muſ. Zeyl. 26, not 76. Arbor indica, Gummi Guttam fundens, fructu dulci rotundo, ceraſi magnitudine; Burm. Zeyl. 27.)—Leaves roundiſh. Stigma four-lobed. Berry of four cells.—Native of Ceylon about Columbo. *Burmann.* A handſome *tree* of a moderate height. *Leaves* round, green, ſucculent. *Fruit* the ſize of a Morella Cherry, eatable, containing four ſeeds only, in a ſweet pulp, ſtreaked with yellow. From the bark of this tree when wounded flows a copious yellow juice, which gradually hardens into a ſmooth gum, proving emetic and purgative.—Such is Burmann's account, and Hermann expreſsly ſays that the beſt Gamboge (*Gummi Gambæ*) comes from this tree, which he eſteems the Carcapuli of Acoſta; the deſcription of which latter agrees rather with our G. *Cambogia*. Hermann ſays the Carcapuli of Acoſta and that of Linſchoten differ in flower and fruit, but agree in other reſpects, and both produce Gamboge, though that of the Kannawakoraka is the beſt. It ſeems therefore certain that our *Garcinia Morella* is the true Gamboge plant. We have never ſeen ſpecimens of this ſpecies in any ſtate. It is to be hoped that ſome light will be thrown on this obſcure ſubject by Mr. W. J. Hooker who has recently undertaken to inveſtigate the botany of Ceylon.—At the end of this genus in Willdenow, p. 849, is an obſervation copied implicitly from Linn. Mant. 2. 391, which is altogether a maſs of confuſion. *Mangium ſylveſtre* ought to be *Lignum corneum*; p. 77 ought to be 55; and the whole alluded to G. *cornea* as different from G. *Mangoſtana*, before the former was regularly adopted as a ſpecies. So precarious is blind tranſcription! S.

GARCON, or GARSOON, a French term, literally ſignifying a boy, or male child, any time before his marriage.

It is alſo applied to divers inferior officers among us called *grooms, garçiones*. Thus all the ſervants in the French king's chambers, wardrobe, &c. who performed the leſſer offices thereof under the proper officers, were called *garçons de la chambre, de la garderobe*, &c.

GARD. See GUARD.

GARD, *Raviſhment de*. See RAVISHMENT.

GARD. *Corps de* GARDE. See CORPS.

GARD, in *Geography*, a department of France, in the ſouth-eaſt region, bounded on the north by the departments of the Lozere and Ardeche, on the eaſt by the Rhône, on the ſouth by the Mediterranean and the department of the Herault, and on the weſt by the departments of the Herault and the Aveiron. Nîmes is its capital. This department, ſituated in 44° N. lat., is compoſed of the dioceſes of Nîmes, Alais, and Uzès, contains 292 ſquare leagues, and 309,052 inhabitants, in 38 cantons, and 365 communes, and is divided into four diſtricts, *viz.* Alais, whoſe inhabitants amount to 65,446, Uzès, 72,033, Nîmes, 113,785, and Le Vigan, 57,788. Its contributions amount to 2,866,398 francs, and the expences charged upon it for adminiſtration, juſtice, and public inſtruction, are 311,120 fr. 66 cent. Interſected by hills, the ſoil is, in general, abundantly fertile, producing grain, wine, delicious fruits, oil, and paſtures. It has mines of copper, iron, vitriol, and other minerals, quarries of marble, and mineral ſprings.

GARDA, a lake of Italy, between the Veroneſe and the Breſſan, about 30 miles long, and from two to ſeven wide.—Alſo, a town of Italy, in the Veroneſe, on the eaſt bank of the lake above-mentioned. In the time of the Guelphs and Gibellines it was a celebrated fortreſs with a citadel; but at preſent it is an open place; and on the ruins of the citadel has been built an hermitage, or convent, of the Carthuſian monks; 16 miles N.W. of Verona. N. lat. 45° 36′. E. long. 10° 43′.—Alſo, a town of Hindooſtan, in Oriſſa; 75 miles S.E. of Cattack.

GARDANE, JOSEPH JAMES, in *Biography*, was born at Ciotat, in Provence, and after he had been created doctor of the faculty of Montpellier, he repaired to Paris, where he again received the ſame degree. His talents procured him the honour of a place in the academies of Montpellier, of Nancy, of Marſeilles, and of Dijon; and by his zeal he obtained the appointment to the Bureau des Nourrices, and to two hoſpitals at Paris. In this city he was actively employed, during ſeveral years, in contributing to the prevention and cure of the moſt deſtructive and loathſome diſeaſes which afflict mankind, eſpecially the ſmall-pox and the lues venerea. He publiſhed a conſiderable number of treatiſes, at Paris, between the years 1767 and 1776, chiefly relating to the two diſeaſes juſt mentioned. Eloy. Dict. Hiſt.

GARDANNE, in *Geography*, a town of France, in the department of the mouths of the Rhone, and chief place of a can-

a canton, in the diſtrict of Aix; 4 miles S.S.E. of Aix. The place contains 2279, and the canton 7529 inhabitants, on a territory of 167½ kiliometres, in 6 communes.

GARDANT, in *Heraldry*. See GUARDANT.

GARDE, in *Geography*, a town of Hinder Pomerania, on a freſh-water lake, abounding with fiſh, near the ſea; 18 miles N.E. of Stolpe.

GARDECAUT, or GARD DU CORD, in a watch, that which ſtops the fuſee, when wound up, and for that end is driven up by the ſtring. Some call it *guard-cock*; others, *guard du gut*.

GARDEFAN, CAPE, or *Straits of Burial*, in *Geography*, as it is called by the Abyſſinians, or *Cape Gardefui*, as it was denominated by the Portugneſe, the *Promontorium Aromatum* of the Romans, denotes that point of the Abyſſinian coaſt of the gulf of Suez, which ſtretches out into the gulf before you arrive at *Babelmandeb*; which ſee. See alſo *Cape* DEFAN.

GARDEIAH, a town of Africa, the capital of Beni-Mezzab; 180 miles E. of Fighig. N. lat. 32° 15'. E. long. 2° 30'.

GARDELEBEN, or GARDELEGEN, a town of the Old Mark of Brandenburg, containing four churches, four hoſpitals, and a manufacture of cloth; celebrated for its beer; 72 miles W. of Berlin. N. lat. 52° 32'. E. long. 11° 36'.

GARDEN, ALEXANDER, in *Biography*, an eminent botaniſt and zoologiſt, was born in Scotland, in January, 1730, and educated at the univerſity of Edinburgh; where he ſtudied botany according to the Tournefortian ſyſtem under Dr. Alſton, and where, probably, he took the degree of doctor of phyſic. He ſettled as a phyſician at Charleſtown, South Carolina, in 1752, and ſoon after married. From his firſt arrival in America he had betaken himſelf to the inveſtigation of the vegetable productions about Charleſtown, with the aſſiſtance of the works of Tournefort and Ray; but he found the greateſt difficulty in aſcertaining his diſcoveries, and eſpecially in reducing ſuch plants as appeared nondeſcripts to their proper places in the ſyſtems of thoſe writers. New ſections were neceſſarily to be formed at every ſtep to admit what they had never ſeen, and the uncertainties attendant on generic or ſpecific diſcrimination were inſurmountable, on account of the great affinity and yet conſiderable difference between American botany and that of Europe, to which the ideas and ſyſtem of Tournefort in particular were accommodated. In the midſt of this perplexity, Dr. Garden met with the *Fundamenta Botanica* and *Claſſes Plantarum* of Linnæus, as well as the *Flora Virginica* of Gronovius. Theſe books, eſpecially the firſt, delighted him ſo much, that he introduced himſelf to the correſpondence of Linnæus in March, 1755, by an elegant and enthuſiaſtic Latin letter, in which he expreſſed his admiration at the clearneſs, didactic preciſion, and ingenuity of theſe writings, and his gratitude for the benefits which he had derived from their repeated peruſal. In the ſummer of 1754 he had been obliged, by indifferent health, to take a journey through ſome of the northern provinces, and viſited Mr. Colden, near New York; where, alſo, he became perſonally acquainted with the celebrated John Bartram, then juſt returned from an excurſion to the Blue mountains. Equally ſtruck with the knowledge and with the candour of theſe men, he became ardently attached to them. "Viri," ſays he, in the above letter, "quorum ut ſumma eſt in arte ſapientia et induſtria, ſic et intemerata fides.

——animæ, quales neque candidiores
Terra tulit."

He had ſcarcely diſpatched this firſt letter, when he received from Europe the *Critica* and *Philoſophia Botanica*, *Amœnitates Academicæ*, and *Syſtema Naturæ*, works well calculated to confirm and to increaſe the taſte he had with ſo much zeal adopted. From this time, therefore, during his ſubſequent reſidence in Carolina, he was a profeſſed and ardent botaniſt, the correſpondent, not only of Linnæus, but of Gronovius, Collinſon, Ellis, and occaſionally of moſt other diſtinguiſhed naturaliſts in various parts of the globe. In his firſt attempt at founding a genus, which he communicated to the great Swediſh naturaliſt by the name of *Elliſia*, he was unfortunate, the plant he deſcribed being *Swertia diſſormis*; ſee FRASERA. Nor was he more ſucceſsful in his next, which proved a *Styrax*, the *lævigatum* of Hort. Kew. v. 2. 75. Linnæus, however, was not at firſt aware of this, and deſtined the ſuppoſed new genus to commemorate Dr. Hales; nor is it certain that he ever diſcovered his miſtake after Ellis had eſtabliſhed a truly diſtinct *Haleſia*, like the *Styrax* in flower and habit, but very different in fruit. At leaſt the *H. tetraptera*, and the leaves, though not the fruit, of *H. diptera*, in the Linnæan herbarium, are both *Styrax grandifolium* of Hort. Kew. The *Stillingia* and *Fothergilla* of Dr. Garden, ſent in 1765, have finally been eſtabliſhed; his *Cyrilla* and *Hopea* have been reduced, the former to *Itea*, the latter to *Symplocos*, by L'Heritier and ſucceeding botaniſts. He was therefore leſs happy than Ellis in the diſcovery of new genera, but it does not follow that he had leſs botanical ſkill. Who can hope always to decide irrevocably on this ſubject?

Linnæus was anxious to obtain from Dr. Garden a knowledge of the inſects, and eſpecially the fiſhes, of South Carolina, and in this he was not diſappointed. The deſcriptions of Garden were altogether Linnæan, and were accompanied by ſpecimens of the ſkins of all the fiſhes, ſpread and dried on a board. He had a black ſervant who was peculiarly dextrous at this operation, ſo as to preſerve the outline of the fiſh, and every important character, with great accuracy. Well aware, nevertheleſs, that in many caſes an entire ſpecimen is abſolutely neceſſary, he ſent many fiſhes and reptiles in bottles of rum, among which were various ſpecies of tortoiſes, lizards, and ſerpents. Hence his name occurs more frequently than that of any other perſon in the Syſtema Naturæ under the claſſes of *Amphibia* and *Piſces*. His moſt celebrated diſcovery was that of the *Siren lacertina*, of which he ſent a deſcription with ſpecimens to Upſal in the ſpring of 1765, and which ſeemed to him a middle link between *Lacerta* and *Muræna*. In Auguſt, 1766, he wrote to Linnæus in Engliſh as follows. "It gives me much ſatisfaction that you had ſome pleaſure in viewing and examining the extraordinary two-legged animal which I ſent you laſt year. We have numbers of them in this province. They live in dams and ponds of freſh water, and in low marſhy grounds all over the province. I have ſeen them of all ſizes, from four inches to three feet or 3½ in length. They always appeared to me to be the ſame animal in every thing but magnitude, and we have none of the *Lacertæ* in this country, except the alligator, that ever grow to above ſix or ſeven inches in length at moſt; and all theſe are land animals, never uſing or living in water but when driven into it. I think you may depend on this being no *larva* of any animal, but a real diſtinct genus by itſelf. In one that I opened laſt ſpring, I think I ſaw the male ſperm, or what we call the ſperm of fiſhes. I ſend you an entire ſpecimen in ſpirits, with the ſkin, head, and vertebræ of the neck, of a pretty large one. Laſt year I deſired my ſervant to daſh the head of one againſt a ſtone to kill it; but he, miſapprehending me, daſhed the whole animal forcibly againſt the ground; when

when to my ſurpriſe it broke off ſhort into three or four pieces, juſt in the ſame manner as the glaſs ſnake does when ſtruck. From this I judged it was not of the eel kind, whoſe ſkin and muſcles are remarkably tough. Though I never yet have been able to know ocularly whether they propagate their ſpecies in this form, yet I have great reaſon to believe it, for we ſhould certainly meet with them in their perfect ſtate if theſe were only *larvæ*, but we poſitively have no animal that reſembles them."—Linnæus found, as he thought, ſo great a peculiarity in the organs of reſpiration in this animal, it having apparently both gills and lungs, that he was induced to eſtabliſh a new order of *Amphibia* to receive it, which he named *Meantes*; ſee the laſt leaf of the 1ſt vol. of Syſt. Nat. ed. 12. This new order was to follow the *Serpentes* at p. 393, not 395. A diſſertation on the *Siren lacertina* is alſo to be found in Amœn. Acad. v. 7. 311. t. 5: and Ellis wrote a paper on the ſubject, which appears in the Philoſophical Tranſactions, v. 56. 189. t. 9. Among the moſt curious conſequences of this diſcovery was a letter written to Dr. Garden by the famous ſir John Hill, which he once ſhewed to the writer of this account. That ingenious but arrogant philoſopher aſſured him, that he himſelf "had diſtributed all the known productions of nature into a ſeries or chain, according to their reſpective affinities, marking each genus, or link of that chain with a number. That there were occaſional interruptions in this ſeries, where he had placed numbers for certain productions, which he knew *muſt exiſt*, but had not yet diſcovered, and that the *Siren* preciſely filled up one of theſe vacant numbers!" This preſumption, ſo different from his own patient and practical inveſtigation of nature, ſo diſguſted Dr. Garden, that he immediately declined all further intercourſe with ſir John, anſwering that "he was himſelf but a humble obſerver, and felt unworthy of correſponding with a man who ſeemed to be ſo intimately in the councils of the Almighty and Allwiſe Creator."—All naturaliſts, however, did not embrace the *Siren*, to their own confuſion, with the ardour of ſir John Hill. The learned Camper diſputed its pretenſions to form a new order, or even a genus, and reduced it to *Muræna*, where it now ſtands in Gmelin's edition of the Syſtema, v. 1. 1136, by the name of *Muræna Siren*.

In a letter dated May, 1770, Dr. Garden gave Linnæus an account of what is called in South Carolina the Potatoe Louſe, "a venomous inſect, of a bright red colour, extremely minute, inhabiting for the moſt part the rotten trunks of trees. Though this inſect is ſo very ſmall as to be ſcarcely diſcernible, it occaſions the moſt ſerious miſchief. In ſummer, the ſeaſon of its greateſt vigour and abundance, thoſe perſons who incautiouſly lie down upon the ground, ſit upon fallen trees, or even walk where it abounds, are attacked by great numbers of theſe vermin at once, which immediately overrun all parts of the body, not only wounding the ſkin and inſerting their poiſon, but introducing themſelves under the cuticle, and occaſioning itching that ſoon becomes intolerable, with ſubſequent inflammation and ſwelling, attended with a piercing burning pain. Very often a fever ſupervenes, and ſmall itching ulcers are formed. The inſect in queſtion is quite different from that kind of flea called by Cateſby the Chigo, or Chigger." In ſome of his letters Dr. Garden finds great fault with the writer laſt named, whoſe whole work, he ſays, "but eſpecially the 2d volume, is ſo incomplete, and abounds with ſuch groſs errors, that it would be no ſmall taſk to amend and complete it; and that he never conſulted it without indignation and diſguſt, at ſeeing the moſt beautiful works of the Creator ſo miſerably defaced and mutilated, and ſo ill repreſented."—The above Potatoe Louſe proved the *Acarus Batatas*, Syſt. Nat. v. 1. 1026.—In the ſummer of 1770 Dr. Garden ſent an intelligent negro ſervant to the iſland of Providence for the purpoſe of collecting natural curioſities, and eſpecially fiſh, this being, as we preſume, the man abovementioned who excelled in their preparation. His harveſt, however, on this occaſion, was much leſs abundant than might have been expected, in conſequence of a ſtorm in his voyage back, which ſo terrified him, that he forgot all neceſſary attention to his collection, in fears for his own life. What arrived in tolerable order were ſent to Linnæus, and among them were ſeveral new or curious fiſhes and inſects. The laſt letter of Dr. Garden to Linnæus in our poſſeſſion is dated May, 1773, and contains a critical account of the fructification of *Zamia pumila*. Soon after this period the political diſturbances in America interrupted his ſcientific correſpondence, and finally obliged him, as having joined the loyaliſts, to quit that country and take refuge in Europe. He left a ſon behind him, but was accompanied to England by his wife and two daughters. We are not informed of the preciſe time of his arrival in England, but it appears, from the records of the Royal Society, that, though elected a fellow of that ſociety June 10, 1773, he was not admitted till May 15, 1783, the latter being probably his firſt opportunity of attending in perſon after he came to London, where he reſided till his death, which happened April 15, 1791, in the 62d year of his age. He had, in conſequence of the recommendation of Linnæus, been elected a member of the Royal Academy of Upſal in 1761.

Dr. Garden had for the greater part of his life laboured under a delicate ſtate of health. He was afflicted with conſtant ſea-ſickneſs throughout his voyage to America, which deterred him from any excurſions by ſea during his abode there, though he ardently wiſhed to examine ſome of the Bahama iſlands in particular. His practice as a phyſician, though very extenſive, was frequently interrupted by the ſtate of his own health, and he was obliged to indulge in the relaxation afforded by a country-houſe and garden, where he delighted to cultivate in luxuriance the choiceſt plants of American growth. The ſcarlet honeyſuckle, entwined among the delicate *Chionanthus*, formed the favourite decorations of his bowers; for it was not ſo much rarity or ſingularity, as beautiful nature, that he loved. His returning voyage was attended with the ſame diſtreſſing inconvenience, and this cauſed a rupture of a veſſel in the lungs. This accident, in a frame ſtrongly prediſpoſed to pulmonary conſumption, with a fair, florid complexion, ſoon produced that diſorder, which finally proved fatal. In perſon, Dr. Garden was tall and thin, with regular features, peculiarly animated eyes, and a benevolent prepoſſeſſing countenance. We have elſewhere obſerved, that "few characters could be more juſtly beloved in private, nor were ſenſibility and cheerfulneſs ever more happily combined. He was an American loyaliſt, free from party bigotry. In ſcientific purſuits, he ſought only truth and nature, for their own ſakes, ever unaſſuming and unambitious, while his name gave authority throughout Europe wherever it appeared. The elegant and fragrant *Gardenia*, dedicated to him by his friend Ellis, is worthy to perpetuate his name." S.

GARDEN, a portion of ground laid out for the purpoſe of ornamental effect, or the raiſing and providing different ſorts of plants of the flowery, herbaceous, and eſculent kinds, as well as various other vegetable productions and fruits by proper cultivation and encloſure.

It is evident, from many different circumſtances, that the introduction of gardens almoſt immediately ſucceeded that of the art of building houſes, and, of courſe, became the natural

natural attendants of property and individual poſſeſſion at an early period. It was ſoon found convenient to have various ſorts of plants and herbs at hand, inſtead of ſeeking them at a diſtance when they were wanted. As the art of cultivation became more general, and its advantages more fully underſtood, the expediency of having diſtinct incloſures for the purpoſe was rendered obvious.

Orchards and vineyards were afterwards had recourſe to as luxury increaſed, and habitations became more general. The ancient gardens ſeem to have been chiefly of this kind, variouſly intermixed with works of art, as fountains, grottos, porticos, ſtatues, ſhady walks, baths, &c. &c.

Modern gardens are, however, moſtly diveſted of all theſe heavy and unnatural ornaments, being more ſimple imitations of nature, contrived for the purpoſe of produce and pleaſure.

Gardens are uſually diſtinguiſhed, by the nature of their products, into the ornamental, or flower, and kitchen kinds, the laſt being chiefly deſtined to the raiſing of uſeful culinary roots, plants, and vegetables. There are alſo nurſery gardens, which are principally employed in raiſing trees, ſhrubs, &c.

Where gardens of the firſt ſort are neceſſary, they ſhould be laid out ſo as to have open ſunny ſheltered expoſures, forming, if poſſible, the connections between the ornamented, or pleaſure-grounds, and the kitchen-gardens, according to the general nature and ſituation of ſuch grounds, ſo as to afford the moſt ſtriking effect and variety that are poſſible.

The nature of their forms may vary in proportion to the diſtribution of the lands, and the particular circumſtances of their ſituations, being made ſquare, circular, oblong, or in any other manner, according to the taſte of the proprietor; the parts approaching the ornamented grounds being moſtly ſeparated by walks, and the introduction of different ſorts of the moſt curious, hardy, flowering, ſhrubby plants. The interior parts ſhould have a neat ornamental diſtribution, ſo as to produce the moſt ſtriking variety when the flowers are in blow, and afford the greateſt convenience in their cultivation. It was formerly the practice to have them laid out with walks ſurrounding the outer boundaries, or borders being introduced all round within them and the inner compartments, divided into a variety of narrow ſtraight borders, or plain four-feet wide parallel beds, having two-feet wide alleys between; the whole of them being laid in a rounding form, and neatly edged with dwarf-box, or ſome other plant ſuited to the purpoſe; and the walks and alleys laid with the fineſt ſand; but at preſent they are moſtly arranged ſo as to ſuit the nature of the ſituation, produce the moſt ornamental effect, and afford the greateſt eaſe, convenience, and ſucceſs in the culture of flowers, &c.

Gardens of this nature ſhould contain all the different ſorts of hardy, curious, ornamental flower-plants, whether of the bulbous, tuberous, or fibrous rooted kinds, and be conſtantly kept in neat order.

The ſecond ſort, or kitchen garden, ſhould be laid out in different methods, according to the differences in the circumſtances of the ground. It is ſometimes ſo managed, as to conſtitute a part of, or communicate with the pleaſure-ground; but where there is ſufficient extent of land, it is better to be diſtinct, or detached from it, and in every caſe as much concealed from the houſe as poſſible. The moſt convenient diſtribution is at ſome diſtance behind it; but on the ſides may anſwer very well, eſpecially when not too contiguous, or ſo ſituated as to interrupt any particular proſpect or view of the adjacent country.

Expoſure.—With regard to the nature of the ſituation moſt proper for this purpoſe, it ſhould, when convenient, be where there is a gentle declination towards the ſouth, or ſouth-eaſt, in order that it may have the full advantage of the morning ſun.

The nature of the expoſure of a garden is a matter of conſiderable importance, as not being capable of change like thoſe of ſhelter, ſoil, &c. It has been obſerved, by a late writer on "Country Reſidences," that the beſt expoſure for a garden is that of the ſouth-eaſt, but that in an extenſive and complete garden, it is deſirable that part of it ſhould have a northern aſpect, in order that late crops may be raiſed with advantage. And this, it is ſuppoſed, may often be attained, either by fixing upon both ſides of a gentle ſwell, or eminence, or on the two oppoſite ſides of a hollow or depreſſion. Should ſuch a hollow wind in any conſiderable degree, every ſort of expoſure would at once be had without difficulty, and moſtly in combination with ſhelter and proper ſoil.

Situation.—This ſhould be relative to the nature of the reſt of the place, and the convenience of water. It ſhould be ſomewhat contiguous to the neceſſary offices, ſtables, &c. and at no great diſtance from the farm, being concealed as much as poſſible from general view, and ſo contrived, as to interfere but little with pictureſque improvements. It ſhould be ſo near a ſupply of water as to have it in abundance for the common purpoſes of watering during the whole of the ſummer months. And it may be uſed in other ways with advantage, in particular ſituations and circumſtances. It is a common but dangerous error to form gardens in too low ſituations, in order that they may have the benefit of natural ſhelter, as they are very liable to the effects of hoar froſts, blights, and mildews. Mr. Forſyth remarks, in his "Treatiſe on the Culture and Management of Fruit Trees," that if a garden "be ſituated in a bottom, the wind will have the leſs effect upon it; but then the damps and fogs will be very prejudicial to the fruit and other crops;" and that when "ſituated too high, although it will, in a great meaſure, be free from damps and fogs, it will be expoſed to the fury of the winds, to the great hurt of the trees, by breaking their branches, and blowing down their bloſſoms and fruit."

Shelter.—A garden ſhould, in this writer's opinion, "be well ſheltered from the north and eaſt to prevent the blighting winds from affecting the trees, and alſo from the weſterly winds, which are very hurtful in the ſpring or ſummer months." Where it is not "naturally ſheltered with gentle riſing hills, which are the beſt ſhelter of any; plantations of foreſt-trees ſhould," he thinks, "be made at proper diſtances, ſo as not to ſhade it." Theſe, he ſuppoſes, will be found the beſt ſubſtitute, but at the ſame time the ſun and air ſhould be freely admitted. On this account it is ſuppoſed that "a place ſurrounded by woods is a very improper ſituation for a garden or orchard, as a foul ſtagnant air is very hurtful to vegetation." It is likewiſe added that "blights are much more frequent in ſuch ſituations than in thoſe that are more open and expoſed." In theſe ſheltering plantations, it is well adviſed that fruit-trees ſhould be intermixed with thoſe of the foreſt kind, which, beſides being advantageous in the way of affording ſhelter, ornament, and fruit, become nurſeries for raiſing foreſt-trees. But where the ſituations will not admit of this, he ſuggeſts the propriety of planting ſome croſs rows of fruit-trees in the garden, at the diſtances of about forty or ſeventy yards from each other, more or leſs, according to the extent: where the length is conſiderable, one row may be ſufficient on each ſide; but in ſhort croſs rows, two on each ſide the walks or paths. In this intention the trees ſhould be planted oppoſite one another, but in ſuch a manner that thoſe in one row may be oppoſite to the middle parts of the

open

open ſpaces in the others. In this method, beſides the ornamental effect that is produced, the force of violent winds is broken, and much damage to other trees prevented.

In this view, the beſt ſort of trees, according to the ſame writer, is that of dwarfs, with ſtems about two feet high, which may readily be provided by removing the lower branches.

The author of the Treatiſe on Country Reſidences adviſes "that the planting ſhould be performed on all ſides of the garden, the diſtance being proportioned according to the particular circumſtances of the caſe. But when the garden is upon the perfect flat, the neareſt foreſt trees ſhould not, in common, be within leſs than one hundred feet of the outer fruit wall, nor on the ſouth ſide within leſs than one hundred and twenty or thirty feet of it; where however it is upon a high riſing bank, they may ſometimes be admitted to come as near as fifty or ſixty feet. It is likewiſe in moſt caſes a good way to form a deep ſunk fence between ſuch trees and the garden ground, eſpecially when they are of the fir tribe, in order to prevent the roots from running too much in the ſurface mould of the garden."

Soil.—In fixing upon ground for a garden, it is likewiſe a point of much importance to have the natural ſoil of a good quality, being ſufficiently dry, mellow, and capable of being eaſily wrought in all ſeaſons, as well as of a good depth, as from a foot and a half to three feet. And if the ſurface be uneven, it will be the better, as there will be a greater variety in the quality, and of courſe it will be more fully adapted to the culture of different crops. The moſt proper ſort of ſoil for this purpoſe is that of the rich, friable, loamy kind, and the worſt thoſe of the very light, ſandy, and ſtiff clayey deſcriptions. But the properties of ſoils may be much improved in moſt caſes by a judicious application of different ſorts of materials in the way of manure.

Some think a medium loam the moſt proper, as being capable of being made of different degrees of lightneſs in different parts, by the addition of ſand and other ſimilar materials, ſo as to ſuit different ſorts of vegetables; and in others of various degrees of tenacity and heavineſs, by the uſe of clay or other coheſive ſubſtances.

Where the under ſoil is of the retentive kind, great care ſhould be taken to have it well drained, as unleſs this be effectually accompliſhed, healthy vegetables or trees can ſeldom be produced. See SOIL and MANURE.

In caſes where fruit-trees, eſpecially thoſe of the finer ſorts, as well as apple and pear kinds, are to be planted, a greater depth of good ſoil, as well as a greater degree of dryneſs, is neceſſary in general than that mentioned above.

Form.—There are very different opinions in reſpect to the moſt proper and advantageous forms for this ſort of culture; but though much muſt depend on the nature of the ſituation, where the ſpade is to be made uſe of in performing the work, the ſquare ſhape, or that which approaches neareſt to it, is probably the moſt convenient. In other caſes, where the principal part of the work is, from the difficulty of procuring labourers, and the increaſing expence of them, to be executed by the plough, the oblong and circular forms may be the moſt ſuitable, as they may be wrought with greater facility and convenience. The ſhape of the garden is uſually decided by the walls, but that which is moſt adapted to the general purpoſes of cultivation is, in the opinion of the above writer, that of a parallelogram; though were the chief object the production of wall-fruit, the oval form with its long diameter from eaſt to weſt would be better, as containing the ſmalleſt quantity of wall hid from the ſun, and a large portion of it conſtantly expoſed to the ſouth. But as all forms, except thoſe of the ſquare kind, derange the regulation of the quarters, and are conſequently troubleſome in digging and cropping, they are in general properly diſcarded, except in ſome flower-gardens, where fruits are raiſed on the walls.

Size.—The ſize of kitchen-gardens ſhould always be fully ſufficient for the extent of the family, varying from half an acre to four, five, or more, within the fence. The firſt quantity, where there are wall and eſpalier trees, will furniſh ſufficient employment for one man, and afford due ſupplies of vegetables and fruit for families, conſiſting of a dozen or more perſons. But much in theſe reſpects depends upon proper care and management. The nature of the ſoil ſhould alſo be taken into the account in determining this point.

Incloſing.—The methods of incloſing that are purſued in theſe caſes vary according to the facility of procuring materials on the particular ſpots. Some adviſe the boundary fence to be a ſunk one, with a hedge or low wall; but others think the beſt mode of incloſing garden-ground is by means of brick walls, where that ſort of material can be eaſily procured, and expence is not an object. But oak paling fences anſwer the purpoſe very well. Theſe fences, whether made of brick or wood, ſhould be eight, ten, or twelve feet in height. Where the extent of walling is ſufficient, Mr. Forſyth thinks ten feet walls better than ſuch as are higher, as being more convenient for various purpoſes. He alſo adviſes that they ſhould have borders or ſlips on the outſides of them, of from forty to ſixty feet or more in breadth, where the ground can be ſpared, which ſhould likewiſe be incloſed by an oak paling, ſix or eight feet in height, having a *chevaux de friſe* at the top to ſtrengthen the fence, and render the garden more ſecure. The latter may be conveniently formed, by planting a piece of wood four inches in breadth, and an inch and quarter in thickneſs, into the ſhape of the roof of a low pitched houſe on the upper ſide, then drawing a line on each ſide from end to end, at the diſtance of about an inch and quarter from the upper edge, driving twelve-penny nails through them in regular rows, at the diſtance of four inches from each other, ſo as to come out near the upper edge of the contrary ſide; each being oppoſite the middle of the ſpace between two nails on the other ſide. The nail heads ſhould be ſunk, and ſtrips of wood nailed over them, tenter-hooks being driven in between the nail points, and the whole nailed faſt to the outſide top of the fence; continuing pieces in this way till the whole is completed and rendered ſecure. It is ſuppoſed that by means of theſe incloſed borders or ſlips on the outſide of the garden walls, there will be plenty of ground for gooſeberries, currants, and ſtrawberries, and both ſides of the walls may be planted with trees, by which there will be a conſiderable increaſe of wall-fruit. And where there are parts of ſuch ſlips lying near to the ſtables, ſufficiently ſheltered and expoſed to the ſun, they may be converted to the purpoſes of a forcing-ground for raiſing melons, cucumbers, and other ſimilar kinds of fruit.

The advantages of this are that there will be no litter carried within the walls, to dirty the walks; the beds will be concealed from the ſight, and much time and labour ſaved in carting and wheeling the dung and other matters.

Where there are not theſe ſorts of ſlips, the forcing-grounds for melons, cucumbers, &c. ſhould be made in ſituations that are warm, and open to the influence of the ſun, being well incloſed, and as contiguous to the ſtable as the nature of the ſituation will admit. It is added that the great objection to having ſlips or borders on the outſides of the walls of gardens is that of the vaſt expence of erecting

two fences, where one is capable of anſwering the purpoſe, and by proper attention in the diſtribution of the internal parts, with perhaps nearly equal advantage.

The author of the work on "Country Reſidences," after obſerving that the northern ſide of ſuch garden-ſtrips ſhould be reſerved for common crops, and the ſouthern for early ones, ſuggeſts that a ſhrubbery may in ſome inſtances be introduced with propriety in a part of the ſpace towards the plantation, ſo as to range in order with mixed plants, from the humbleſt ſhrub in the edge of the walk, to the higheſt foreſt trees. In this way complete ſhelter may be afforded, and at the ſame time an agreeable effect produced at moſt periods of the year. But in many caſes its place may be ſupplied ſimply by a ſingle holly hedge placed on the top of the ſunk fence, by which means a larger portion of ground may be applied to the raiſing of culinary vegetables, and the character of utility be more fully preſerved. It occaſionally happens, from the declination of the ground in a ſoutherly direction, that the uniformity of ſuch "outer incloſure can be broken, and a large bay or receſs be made in the wood, either to contain all the hot-houſes, hot-beds, &c." or the latter only; which is always a great advantage.

Subdiviſion.—In the diſtribution of the quarters or parts of the garden, attention ſhould be had to the nature, form, and extent of the ground, ſo as that they may be laid out in the beſt manner, in reſpect to the convenience of managing them, expoſure, and ſize; but they ſhould never be made too ſmall, as there will be much loſs of ground by the walks, which are eſſentially neceſſary in their cultivation. With regard to their form, it may vary according to circumſtances, or the taſte of the proprietor; but the moſt convenient and economical one, in reſpect to ground, is the ſquare, where the garden has been laid out in that manner. It is uſual to have borders round the whole of the incloſing fences, whether they be conſtructed of brick, ſtone, or timber; and where there are croſs walls, they are generally introduced on the ſides of them. The breadths of theſe ſhould be proportioned to the height of the walls or palings, and the extent of the garden, as from ſix, to eight, ten, and twenty feet, eſpecially thoſe which have a ſouthern aſpect, and are intended for the reception of fruit-trees, as their roots will have more room to extend themſelves and procure due nouriſhment. Beſides, wide borders are the moſt advantageous and economical in the culture of different vegetable crops.

Where the gardens are large, other borders may be carried along on the ſides of the walks, between them and the eſpalier or ſtandard fruit-trees; but in other caſes this is inconvenient, as taking up too much of the quarters. Theſe ſhould not exceed ſix or eight feet in breadth.

With ſome it is the practice to have the edges of the borders made firm and even, and planted with dwarf box, or ſome other plant made uſe of for the purpoſe; but as theſe ſorts of edgings are very liable to be deſtroyed in different places by wheeling over them, and by that means become unſightly, it is probably a better method to only have the edges of the border made up firm and even, cloſe to the gravel of the walks.

Walks.—In common there ſhould be a walk introduced on the ſides of the borders all round, and likewiſe in the middle where the ground is of conſiderable extent. Croſs walks are alſo neceſſary where the garden has a great length. But as walks take up much ground, there ſhould be as few as poſſible. Thoſe on the ſides of the borders need not have more breadth than from four to ſix feet; but the middle one ſhould be ſeven feet wide, in order that a cart may be admitted when neceſſary.

It is alſo neceſſary to have walks about two feet or two feet and a half wide, and the ſame diſtance from the walls, where there are wall-trees, for the convenience of pruning, training, and nailing, as well as that of gathering the fruit, and admitting a barrow or garden-engine for watering them.

And beſides theſe permanent walks, when the gardens are of much extent, trodden path-walks will be requiſite in different parts, for the convenience of cultivation, and as diviſions between the crops of different kinds.

All the firſt ſorts of walks ſhould be laid out in a regular manner, and be firmly made up with brick rubbiſh, ſtone-maſons' chippings, or ſome other coarſe material; and neatly gravelled over. For this laſt purpoſe binding ſand anſwers extremely well, alſo good clean ſifted road drift, as they may be readily kept clean by the hoe and rake; but ſea-coal aſhes are preferred by ſome, as being ſtill more dry and firm, more eaſily kept in order, and cleaner to walk upon in thaws, as well as uſeful, while new and rough, in preventing ſlugs from travelling over them from the different quarters of the ground.

The narrow walks on the back ſides of the borders near the fruit-trees, need not be laid with any ſort of coarſe rubbiſh, being merely covered over to the depth of a few inches with ſand or ſea-coal aſhes, as by this means the ground may be occaſionally dug up, and the path re-laid.

Whatever ſort of material is made uſe of in forming the walks, it ſhould be ſpread in a neat even manner, ſo as to leave them in a regular moderate convex or rounded form, by which the water will be readily carried off to the ſides, and the walks kept perfectly dry. After the ſurface material has been thus applied, and evenly raked over, it ſhould be firmly rolled down by a heavy iron roller, and occaſionally repeated after being well moiſtened with rain.

Sometimes walks are laid with turf or ſward, but this is a very improper material, as being troubleſome to keep in order, and ſoon rendered diſagreeable to the ſight, by being wheeled and trampled upon in the work of the garden.

Walls.—In building the walls of kitchen-gardens, when the height is conſiderable, the foundation ſhould be from two to two bricks and a half in thickneſs, and the off-ſet not more than one brick above the height of the level of the border, being then brought to a brick and a half in thickneſs; where they are extenſive, they ſhould be ſtrengthened by piers at the diſtance of from forty to ſixty feet, according to their height. The projection of theſe piers ſhould not be more than about half a brick before the ſurface of the wall. Walls for fruit-trees ſhould always, if poſſible, be built with brick, as ſtone is found not by any means ſo favourable to the maturation of the fruit, and far more inconvenient in the nailing of the trees. The manner of conſtructing hot-walls for bringing fruit forward by artificial heat will be deſcribed hereafter. See HOT-WALL.

Where ſituations cannot be provided with convenience without the walls of the garden for the whole of the forcing apparatus, the pits and hot-beds may be placed in ſunk areas in the quarters of the gardens as near as convenient to the hot-houſes.

Copings.—Some adviſe projecting copings of ſtone or wood to be fixed upon the tops of the walls, and the author of the "Philoſophy of Gardening" conceives that they may be of great utility in the early vernal months in preventing the tender young ſhoots of fruit-trees from being

deſtroyed by froſt, as, from their being leſs imbued with the night-dews in conſequence of them, they will be leſs expoſed to danger from that cauſe; it being well aſcertained that the fine ſhoots of vegetables are moſt expoſed to the deſtruction of froſt when in a moiſt ſtate.

But Mr. Forſyth does not however approve of ſuch fixed copings, eſpecially when they project ſo far as is uſually the caſe; moveable wooden ones faſtened by iron hooks to pieces of wood built into the tops of the walls being in his opinion preferable. Beſides, they are uſeful to fix nettings, &c. to in the early ſpring, for protecting the trees. When fixed copings are adopted, they ſhould not, he thinks, extend above an inch on each ſide of the wall, as the ſlight projection will be ſufficient to preſerve it, and at the ſame time not prevent the dews and rains from falling upon the upper parts of the trees, by which they are greatly benefited. Copings are ſometimes formed of a ſort of brick made convex on the ſide which is upwards; but theſe are expenſive. A ſort of ſlate brought from Wales has lately been made uſe of for this purpoſe, which ſeems to anſwer very well. It is made to have the projection juſt mentioned. This ſort of coping has been employed in the extenſive gardens at Aſhted park, near Epſom, and may be had of different ſizes at Mr. Samuel Wyatt's ſlate-wharf near Blackfriars' bridge, London. Mr. Forſyth ſuggeſts that common copings ſhould have a little ſlope given them "towards the north or eaſt, according to the aſpect of the wall," by which the wet from the ſouth and weſt ſides may be taken away, and the danger of the early bloſſoms and fruit being injured on the ſouth and weſt walls in cold nights be avoided.

Drains.—Where the ſoil of a garden is naturally of a ſtiff retentive quality, and retentive of moiſture, proper under-draining will be eſſentially neceſſary in order to the production of good well taſted fruit, as well as fine culinary vegetables. In theſe caſes the main or leading drains ſhould be made under the walks, and thoſe from the quarters be formed to communicate with, and empty themſelves into them. They ſhould be conſtructed of bricks, either common or ſuch as are formed for the purpoſe, and be laid in ſuch directions as are the beſt adapted to the removal of the injurious wetneſs, and always of ſuch depths as to prevent their being injured by the ſpade in working the ground. By this means the ſoil will be kept in a ſuitable ſtate for the growth of the plants, and the walks preſerved in a fine ſtate of dryneſs, ſo as to be ſufficiently firm for carting or wheeling upon, even in wet ſeaſons.

Where the ground deſtined for the purpoſe of forcing is on a level conſiderably lower than that of the garden, the water from the latter may be made to ſupply the former, by having the main leading drain terminating in a tank, pond, or ciſtern conſtructed in it for the purpoſe, which in many ſituations may be extremely convenient and uſeful.

In many caſes, and eſpecially where the garden grounds are of a dry quality, it is of vaſt advantage to have them ſituated contiguous to rivers, brooks, or large baſons of water, from which they can be ſupplied by means of drains, pipes, or other contrivances, in the moſt hot and droughty ſeaſons of the year.

But where no ſupplies of water can be provided and brought to the garden in theſe ways, Mr. Forſyth ſuggeſts that where they lie on the ſides of public or other roads, and the level of the ground is ſuitable, hollow drains ſhould be formed in the moſt convenient parts, to receive the water that waſhes them in rainy ſeaſons, and convey it to large ponds or other places made for its reception in the higheſt part of the garden ground that will admit of it, from which it may be diſperſed to the different quarters that will allow of it by pipes, with cocks fixed at different places for turning it on, as may be neceſſary. Or, by having ſuitable channels cut, it may be turned upon different parts, as in the practice of watering meadow land, which, where the roads are repaired with calcareous materials, or there is much vegetable matter waſhed down them, may be highly beneficial in the way of manure. A proper ready exit for the ſuperabundant water muſt always be provided in theſe caſes, to prevent ſtagnation. And where the ground has been much enriched by ſtable manure, the practice ſhould be cautiouſly adopted, as more fertility may be conveyed away in the ſtate of ſolution than is brought by the water. The moſt convenient time for turning on water is generally during the night, which in dry ſeaſons is the moſt advantageous to the plants or crops that are upon the ground.

The expence in pipes, drains, channels, and other apparatus for theſe purpoſes, will be conſiderable at firſt; but the ſaving in labour, and time, in pumping and carrying water, it is conceived, will ſoon repay it. Where water is under the neceſſity of being pumped up from deep wells, large baſons or reſervoirs ſhould be provided, in which it ſhould remain ſome time expoſed to the influence of the atmoſphere, before it is made uſe of in the above or any other way in gardens.

Where garden grounds are of a wet ſpewy quality, Mr. Forſyth recommends baſons to be formed in the moſt convenient parts of them, for the reception of the water that proceeds from the drains, and which falls in rain on the walks and paths, as well as other parts.

Forming new Gardens.—In forming new kitchen garden grounds, where the ſoil is of a ſtrong, ſtiff, heavy quality, they ſhould be ploughed or trenched over three or four times, being expoſed to the effects of froſt, in pretty high ridges, for a winter, in order to bring them into a proper condition before the crops are put in. A crop of potatoes or beans alſo aſſiſts greatly in bringing them into a proper ſtate of pulverization for being planted upon with culinary vegetables.

When the land is become ſufficiently broken down and reduced, the wall and other trees, as well as different ſorts of vegetable crops, may be put in. Some, however, put the fruit-trees in before this has been accompliſhed; but it is not a good practice, as they are liable to be injured by the digging which afterwards becomes neceſſary in preparing the ſoil in a proper manner.

In planting wall-trees they ſhould be ſet at different diſtances according to the kinds: thoſe of the peach, nectarine, apricot, plum, and cherry deſcriptions at fifteen, eighteen, or more feet, and for figs and pears twenty are ſeldom too much, ſuitable aſpects being choſen according to the kinds. Between their wall-fruit trees, ſome at firſt introduce half or full ſtandards, that the walls may at once be covered, removing them afterwards. But this is a method that ſhould never be attempted where it can be avoided, as being very diſadvantageous. Trees of the eſpalier kind are likewiſe frequently introduced in ranges round the main quarters at the diſtance of about ſix feet from the ſide of the walk, and from fifteen to twenty in the rows, according to the ſorts that are made uſe of. Within theſe ranges of eſpalier trees,

good

good ſtandards of tall growth are occaſionally introduced at the diſtance of thirty, forty, or more feet in each direction. Where there are orchards this ſhould, however, always be avoided as much as poſſible.

Fruit-trees of the ſmall ſhrubby kinds, ſuch as gooſeberries, currants, raſpberries, &c. where there are not outſlips, are frequently introduced on the ſides of the quarters, and as diviſions to them when large, at the diſtance of eight or nine feet from each other. When planted in this way, they ſhould be trained in the fan form. But it is better, where it can be done, to have them in ſeparate plantations, eſpecially the firſt ſort.

Cropping.—In reſpect to the diſtribution of the vegetable crops, it muſt be regulated by the nature of the ſituation, their particular kinds, as well as the taſte and experience of the gardener. On the narrow borders under the wall-trees various ſorts of ſmall crops may be grown, both of the early and late kinds, according to the difference of the aſpects; but all the deep rooting ſorts ſhould be avoided, ſuch as cabbages, cauliflowers, beans, peaſe, except thoſe of the frame kind, as being injurious to the trees by the ſhade which they cauſe, as well as by depriving them of due nouriſhment.

But the large parts of the borders next the walks are proper for raiſing all ſorts of the more early crops, ſuch as thoſe of the raddiſh, lettuce, ſpinach, carrots, French beans, ſallad herbs, and all the dwarf pea kinds that are cultivated in wide rows; thoſe which have a ſouthern aſpect for the earlieſt crops; and the eaſtern and weſtern ones for ſucceſſion crops of the ſeveral kinds; and the northern ones, as being more cool, for raiſing and pricking out many ſorts of ſmall plants, ſlips, and cuttings in the ſummer ſeaſon, when the other parts are apt to be too dry and too much expoſed to the heat of the ſun.

All ſuch borders as are next to the ranges of eſpalier trees are well ſuited to the different low growing crops, ſuch as lettuce, ſpinach, endive, ſtraw-berries, &c. and for pricking out upon, at different ſeaſons, many ſorts of plants to be afterwards tranſplanted into different ſituations, in order to complete their growth.

But the quarters or large diviſions ſhould always be deſtined for the reception of the large principal crops, ſuch as thoſe of the onion, leek, carrot, parſnip, turnip, beet, potatoe, cabbage, cauliflower, brocoli, colewort, kale, pea, bean, ſcarlet-bean, celery, artichoke, aſparagus, and other ſimilar kinds.

The preparation of the ground, the methods of manuring, and putting in the crops, with their modes of after-culture and management, are fully explained under their reſpective general heads.

In every department the greateſt attention ſhould be paid to the keeping of the different parts fully cropped, as well as to neatneſs and regular order; and as the crops are removed from the ground in the autumn, it is often of great advantage to have it ridged up for the winter in a regular manner.

Where the garden has been thus laid out, planted, and finiſhed, Mr. Forſyth has found much advantage from having a plan of it, with the names of the different trees introduced in their proper places. By this means the memory is greatly aſſiſted, eſpecially in extenſive grounds, and the various operations performed with more regularity and exactneſs.

Mr. London adviſes that in complete reſidences the kitchen garden ſhould be laid out at firſt, and directed afterwards ſolely in the view of cultivating and producing culinary fruits and vegetables. Little or nothing of the ornamental kind ſhould be introduced, but utility every where predominate. Even the edgings of the walks ſhould be planted in moſt caſes with uſeful plants, ſuch as ſtraw-berries, parſley, &c.

The flower garden, green-houſe, plant-ſtoves, &c. ſhould be entirely by themſelves, though they are often intermixed with the others in leſs complete reſidences.

The plans of gardens may be varied very conſiderably according to the nature, ſituations, and other circumſtances of the places where they are to be formed; but that which is repreſented in the correſponding plate, ſeems to poſſeſs moſt of the advantages that have been introduced by modern improvements in the art of gardening.

Robbing gardens and orchards of fruit growing in them, ſtealing underwoods and hedges, and ſtealing or deſtroying any turnips, potatoes, or the roots of madder, when growing, are puniſhable criminally, by whipping, ſmall fines, impriſonment, and ſatisfaction to the party wronged, according to the nature of the offence, by the ſtatutes 43 Eliz. cap. 7. 15 Car. II. cap. 2. 23 Geo. II. cap. 26. and 31 Geo. II. cap 35. And by ſtat. 6 Geo. III. cap 36. and cap. 48. and 13 Geo. III. cap. 33. the ſtealing by night of any trees, or of any roots, ſhrubs, or plants to the value of 5*s*. is made felony in the principals, aiders, and abettors; and in the purchaſers, knowing the ſame to be ſtolen; and the ſtealing of any timber trees, as oak, beech, cheſnut, wallnut, aſh, elm, cedar, fir, aſp, lime, ſycamore, and birch, and of any root, ſhrub, or plant, by day or night, is liable to pecuniary penalties, for the two firſt offences, and for the third is a felony, liable to tranſportation for ſeven years.

GARDEN *Engine*, a contrivance of the pump kind, deſigned for the purpoſe of watering different ſorts of wall and other trees, ſhrubs, &c. Engines have likewiſe been invented for ſteaming hot-houſes, melon-pits, &c. in order to obviate the effects of the red-ſpider, &c.

GARDEN, *Floating*, a ſort of garden employed by the Mexicans, according to the account given by the Abbè Clavigero, in the lake of that name, on their being brought under the dominion of the Colhuan and Zepanecan nations. Induced by neceſſity and the deſire of benefit, they had recourſe to the forming of a kind of moveable or floating gardens, by plaiting and twiſting the branches of willows, and other marſh or aquatic plants that are light, together. Upon this baſis they firſt place the light bruſhwood that floats on the lake to ſome thickneſs, then over the whole the earth, mud, and dirt that are got up from the bottom of the lake. The figure in which theſe gardens are made, is regularly quadrangular, but varying in the length and breadth, though commonly about eight poles long, with not more than three in breadth, having only about a foot above the ſurface of the water. Theſe were, it is ſaid, the firſt portions of ground that theſe people cultivated after the founding of the city of Mexico. In theſe they firſt raiſed the maize, great pepper, and other plants the moſt neceſſary to their ſupport. Gradually as they became more numerous, from the exertions of the labourers, odoriferous and other plants, deſtined to the uſes of ſuperſtition and luxury, were introduced into them; and they are at preſent appropriated to the culture of moſt ſorts of garden plants and flowers. The abundant produce of theſe prolific gardens are brought daily by the canal in numerous ſmall veſſels, at ſun-riſe, to the great market-place of the capital to be ſold. The plants thrive in theſe ſituations in an aſtoniſhing manner; the mud of the lake being extremely fertile and productive, without the aid of rain. A ſmall tree and hut commonly ſhelter the cultivators of the larger ſorts of theſe gardens from the effects of rain and heat. Whenever the owners of theſe gar-

dens are inclined to change their ſituations, they get into their little veſſels, and by their own ſtrength alone, or, where that is not ſufficient, by the aſſiſtance of others, they get them afloat, and tow them after them wherever they pleaſe. This floating garden ſcene is highly curious and intereſting, ſo as to form a place of great recreation and amuſement.

GARDEN-*Frame*, a kind of frame employed in gardens for forcing different ſorts of vegetables, &c. See FRAME, and FORCING-*Frame*.

GARDEN, *Hanging*, a ſort of ancient garden, which is ſaid to have been formed in a raiſed manner, on arches, by Nebuchadnezzar king of Babylon, with the view of gratifying his wife Amyctis, who was the daughter of Aſtyages, king of Media. Theſe gardens are ſuppoſed by Quintus Curtius to have been equal in height to the city, which is fifty feet. They contained on every ſide a ſquare of four hundred feet, and were carried up in ſeveral terraces, ſurmounting each other, to which there were aſcents by different flights of ſtairs or ſteps, that had ten feet in width. The arches that ſuſtained the whole of this pile were raiſed above each other, being ſtrengthened by a wall on every ſide of above ſeven yards in thickneſs. The floors of the ſeveral terraces were laid firſt with large flat ſtones of conſiderable lengths and breadths, over which was placed a ſtratum of reed mixed very fully with bitumen, then two rows of bricks cloſely cemented together with mortar, and the whole afterwards covered with thick ſheet lead, upon which the mould of the garden was depoſited, to ſuch a depth as to admit large trees to take root and eſtabliſh themſelves in it. Trees, plants, and flowers of various kinds were introduced into theſe gardens.

The upper terrace was likewiſe provided with an aqueduct or engine, by which the water was drawn up from the river, and diſperſed over the whole of the gardens when neceſſary.

Some have condemned theſe gardens as unnatural, while others have conſidered them as deſerving of a portion of praiſe; but whatever merit may have been allowed them, they could certainly never have any thing of the natural or rural character about them. See PENSILES *Horti*.

GARDEN-*Implements*, the different ſorts of tools that are employed in performing the work of gardening. Theſe are of ſeveral kinds, as ſpades, hoes, rakes, ſhears, knives, ſaws, rollers, &c. as may be ſeen in the annexed plate.

GARDEN-*Roller*, ſuch as is made uſe of in gardening. They are of two kinds, as wood and iron; the former is the moſt uſeful upon graſs, but the latter where gravel is to be rolled down. See ROLLER.

GARDEN *Sheds*, ſuch as are neceſſary in gardens for containing tools, flower-pots, hot-bed frames, glaſs-ſaſhes, and for working in during rain or bad weather. They are beſt placed on the back ſide of the hot-houſe, by which means they may be made to hold the furnaces, fuel, and many other articles.

GARDEN *Traps*, a ſort of ſtrong iron traps of conſiderable ſize, conſtructed for the purpoſe of being placed in ſuch garden grounds as are much expoſed to the nocturnal depredations of robbers. They are capable of ſecuring a ſtrong man, as they act with prodigious power. They are uſually placed ſo as to be quite concealed. The form in which they are made is, in general, ſomewhat that of the common rat-trap. Wherever traps of this kind are ſet, it is neceſſary to have a notice fixed up.

There are ſeveral other ſorts of traps employed in gardens for taking mice and other kinds of vermin, &c. See VERMIN.

GARDEN *Bay*, in *Geography*, a bay on the eaſt coaſt of Newfoundland. N. lat. 49° 42′. W. long. 54° 50′.

GARDEN *Iſlands*, a cluſter of ſmall iſlands in the Pacific ocean. N. lat. 21° 45′. W. long. 146° 20′.

GARDEN-*ſnail*, in *Conchology*. See HELIX *hortenſis*.

GARDENER, a perſon who has the care and management of a garden. A complete gardener ſhould, beſides the cultivation of all ſorts of culinary vegetables, be perfectly acquainted with the different operations of pruning, training, budding, grafting, and layering, as well as thoſe of raiſing and forcing all ſorts of plants, fruits, roots, &c. It is only in this way that he can be fully qualified for his employment. It is very ſeldom, however, that the common gardener is much informed in reſpect to the higher branches of the art. The buſineſs of the gardener requires a continual care and attention to the different objects, and of courſe much ſteadineſs in the perſon who has the direction of it.

GARDENIA, in *Botany*, ſo named by Ellis in honour of his able friend and correſpondent Dr. Alexander Garden, F.R.S.: ſee that article.—Linn. Gen. 116. Schreb. 162. Willd. Sp. Pl. v. 1. 1225. Thunb. Diſſ. Bot. 1. Ait. Hort. Kew. v. 1. 293. Mart. Mill. Dict. v. 2. Juſſ. 201. Lamarck Illuſtr. t. 158. Gærtn. v. 1. 140. t. 28. f. 4, *Ceriſcus*. (Genipa; Plum. Ic. t. 136. Linn. Gen. 96. Schreb. 136. Juſſ. 201. Tourn. t. 436, 437. Randia; Linn. Gen. 85. Schreb. 111. Juſſ. 199. Gærtn. t. 26. Browne Jam. 143. t. 8. f. 1. Lamarck Illuſtr. t. 156. Muſſænda; Jacq. Amer. 69. t. 48, 49.)—Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Contortæ*, Linn. *Rubiaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth ſuperior, of one leaf, in about five, more or leſs deep, upright, vertical, permanent ſegments. *Cor.* of one petal, funnel-ſhaped; tube cylindrical, longer than the calyx; limb ſpreading, in five, rarely more, deep, oblique or contorted ſegments. *Stam.* Filaments none; anthers five, linear, ſtriated, ſeſſile in the mouth of the tube, and half as long as the limb. *Piſt.* Germen inferior; ſtyle ſlightly club-ſhaped, as long as the tube; ſtigma prominent, obovate, obtuſe, lobed or furrowed. *Peric.* Berry coated, of from one to four cells. *Seeds* imbedded in pulp, numerous, depreſſed, imbricated.

Eſſ. Ch. Corolla of one petal, contorted. Berry coated, inferior, with many ſeeds. Stigma lobed. Anthers ſeſſile in the mouth of the tube. Segments of the calyx vertical.

Obſ. The moſt natural number in the parts of the flower is five; but in ſome ſpecies it varies, as Thunberg remarks, as far as nine in the anthers, as likewiſe in the diviſions of the corolla and calyx. The ſeſſile anthers, and the twiſted or vertical ſegments of the calyx, form the moſt important characters, eſpecially the firſt. Linnæus, from the ſhape and direction of the ſegments of the corolla, particularly in his original ſpecies, referred this genus to the natural order of *Contortæ*, but Juſſieu more properly reduces it to his own *Rubiaceæ*, an order whoſe limits and characters were not fully known to Linnæus, and which perhaps requires ſubdiviſion. *Genipa*, adopted by Linnæus from Plumier and Tournefort, is generally agreed to be a real *Gardenia*, notwithſtanding the very ſlight ſegments or teeth of its calyx; but that name, though of prior origin, is of barbarous derivation, and even Lamarck has agreed to ſink it in the well-merited *Gardenia*. The ſtamens of *Genipa* in Plumier's figure, copied by Tournefort and Lamarck, are erroneouſly repreſented. *Randia* is alſo a prior name to *Gardenia*, but we are by no means inclined to prefer it, independently of the great inconvenience of ſuch a change; nor are we ſure that *Randia* ought not to remain by itſelf, on account of the ſeemingly horizontal calyx-teeth.

The original idea and characters of this genus, are taken from

from G. *florida*, Linn. Sp. Pl. 305, commonly called the Cape Jaſmine. This was firſt brought to England by a Captain Hutchinſon, who, about the middle of the laſt century, met with a buſh of it in full flower, ſomewhere near the Cape of Good Hope, probably in a cultivated ſtate. He brought the whole plant in a pot to England, and it was preſerved in the collection of Mr. Warner, a great cultivator of exotics. Mr. Gordon the nurſeryman having obtained layers from this tree, propagated it ſo ſucceſsfully that he is ſaid to have gained more than 500*l.* by the produce. It is now frequent in gardens, treated as a ſtove plant, though it chiefly requires great heat in the early ſpring, to make it bloom, being at other times a hardy greenhouſe plant. The flowers with us are always double, like thoſe of the original ſhrub brought by Captain Hutchinſon, with only imperfect traces of anthers; but many ſpecimens with ſingle flowers have been brought from the Eaſt Indies, in ſeveral parts of which it grows wild, as well as in China and Japan. Miller and Ehret publiſhed figures of this beautiful ſhrub as a Jaſmine; but the more intelligent Ellis determined it to be a new genus, and publiſhed its characters with a plate in the Philoſophical Tranſactions, v. 51. The *ſtem* is ſhrubby, three or four feet high, much branched, ſpreading. *Leaves* oppoſite, on ſhort ſtalks, elliptical, various in breadth, bluntly pointed, entire, ſmooth, veiny, evergreen. *Stipulas* ſheathing, intrafoliaceous, obtuſe. *Flowers* ſolitary, terminal, ſtalked, of the ſize and aſpect of a double *Narciſſus poeticus*, with a ſweet and very powerful ſcent, reſembling the flavour of ginger. They turn buff as they fade.

The South-ſea plant, uſed by the inhabitants of thoſe iſlands to adorn their hair, appears to be a diſtinct ſpecies, as far as we can judge from an unpubliſhed plate communicated by ſir Joſeph Banks to ſeveral of his friends. The ſegments of its corolla are much narrower, the tube longer, and the leaves more obovate. Yet this plate is announced by Thunberg, in the 18th page of his diſſertation, as G. *florida*.

G. *radicans*, Thunb. Diſſ. t. 1. f. 1, a native of Japan, where it was firſt obſerved by Kœmpfer, is another genuine *Gardenia*. It is of more humble, decumbent or creeping growth, and ſmaller in every part, but otherwiſe much like the *florida*. We have ſeen it alive at Meſſrs. Lee and Kennedy's, Hammerſmith.

G. *Thunbergia*, Linn. Suppl. 162, (*Thunbergia capenſis* of Montin in the Stockholm Tranſ. for 1773,) is one of the fineſt and moſt indubitable ſpecies, a native of the Cape of Good Hope. Though frequent in our ſtoves it rarely bloſſoms. See Curt. Mag. t. 1004. The calyx in this burſts obliquely. The ſegments of the corolla are uſually eight or nine, with as many anthers.

The *Muſſænda formoſa*, and *M. ſpinoſa* of Jacquin above cited, very different in genus from the original *Muſſænda* of Hermann, Linnæus, and others, are very juſtly reduced to *Gardenia*.

We have ſeveral certain ſpecies beſides from the Eaſt Indies, with more that are doubtful. *Rothmannia* probably ought to be kept diſtinct, as Mr. Saliſbury has judged. See Parad. Lond. t. 65; and Curt. Mag. t. 690.

GARDENIA, in *Gardening*, contains plants of the flowering ſhrubby kind for the ſtove; of which the ſpecies cultivated are the fragrant Gardenia or Cape jaſmine (G. florida); and the round-leaved Gardenia (G. aculeata); of which the firſt ſort varies with ſingle and double flowers.

Method of Culture.—In the firſt ſort it may be effected by planting cuttings of the young ſhoots in pots of light rich mould in the ſummer ſeaſon, plunging them in a moderate tan hot-bed, and covering them cloſe with bell-glaſſes, giving due ſhade till they have ſtricken root. When this has been fully effected, they ſhould be carefully removed into ſeparate ſmall pots, and replunged in the hot-bed. When they are become well eſtabliſhed, they ſhould be gradually inured to the influence of the air. And the ſecond ſort may be raiſed by ſowing the ſeeds in pots filled with light freſh earth in the early ſpring months, plunging them in a bark hot-bed, frequent ſlight waterings being given. After the plants come up, they ſhould have free air in fine weather, and be often watered. When of ſome growth they ſhould be carefully removed into ſeparate pots, and be placed in the hot-bed, due ſhade being given till they are rooted, when they muſt have air and water in proportion to the warmth of the ſeaſon. As the autumn approaches they ſhould be removed into the bark-bed of the ſtove, where they are beſt kept the two firſt ſeaſons; but they may afterwards be expoſed in the open air in the hot ſummer months.

All theſe plants are uſeful for the variety which they afford in collections of ſtove plants, and have a fine effect amongſt them.

GARDENING, the art of forming, planting, cultivating, and managing garden grounds, whether of the ornamental or culinary kinds. In a more enlarged ſenſe, it is the buſineſs of rendering the rural objects of nature more agreeable, intereſting, and uſeful to mankind; in the execution of which the operator has the whole range of country ſcenery at his command, in order to ſelect with taſte ſuch parts as are the moſt appropriate and ſuitable to his particular views and purpoſes.

Gardening is one of thoſe arts that muſt obviouſly, from the neceſſities of mankind, have been practiſed at a very early period, ſo far at leaſt as herbs and fruits are concerned. It ſeems not improbable but that it almoſt immediately ſucceeded the forming of diſtinct habitations, and the poſſeſſion of individual property. It muſt, however, have remained long after its introduction in a very rude and imperfect ſtate, as, notwithſtanding the accounts that have been given of the magnificent gardens of early times, the Greeks and Romans ſeem to have been but little acquainted with them; for the garden of Alcinous, when diveſted of the beautiful language of the poet, appears to have been nothing but a ſort of orchard and vineyard ſomewhat adorned with the prevailing works of art; or thoſe of Lucullus, Cicero, and Pliny, among the Romans, any thing more than mere places of retreat, planted with various odoriferous flowers and ſhrubs, and embelliſhed with a variety of heavy unnatural works of ornament. This taſte in gardening would ſeem to have continued until the introduction of the Dutch ſyſtem by London and Wiſe, and the eſtabliſhment of that of the cutting, clipping, and ſhearing plan by Brown, and indeed to have been partially combined with theſe for ſome time afterwards by Repton and others of the ſame ſchool; though the genius of Milton had long before foreſeen and ſuggeſted the impropriety of employing ſuch abſurd and fantaſtic ornaments. The ſhearing of yew, box, and holly into figures of various kinds, and the ſhaving of river-banks, lawns, &c. however, went on until their abſurdity rendered them perfectly contemptible, and cauſed a better and more natural taſte. The keen and ſpirited ſtrictures of Mr. Knight on the folly of this practice are too juſt and intereſting to be omitted:

> "Shaved to the brink, our brooks are taught to flow
> Where no obtruding leaves or branches grow;
> While clumps of ſhrubs beſpot each winding vale,
> Open alike to every gleam and gale;

Each ſecret haunt, and deep receſs diſplay'd,
And intricacy baniſh'd with its ſhade.
" Hence, hence! thou haggard fiend, however call'd,
Thin meagre genius of the bare and bald;
Thy ſpade and mattock here at length lay down,
And follow to the tomb thy favourite Brown:
Thy favourite Brown, whoſe innovating hand
Firſt dealt thy curſes o'er this fertile land;
Firſt taught the walk in ſpiral forms to move,
And from their haunts the ſecret Dryads drove;
With clumps beſpotted o'er the mountain ſide,
And bade the ſtream 'twixt banks cloſe ſhaven glide;
Baniſh'd the thickets of high tow'ring wood
Which hung, reflected, o'er the glaſſy flood."
Landſcape, p. 25. ed. 2.

Verdant ſculpture, and that regular preciſion that marked the views of the preceding period, were now, however, wholly laid aſide, and more chaſte deſigns ſubſtituted in their places. Bridgman became at this time a leading deſigner, who, diſdaining the trammels of his predeceſſors, extended the plans, and rejected the notions of forming the different diviſions of the garden ſo as to tally with their oppoſites, which were common before. And though it muſt be confeſſed that he retained an attachment to ſtraight walks and high clipped hedges, it was only as a ſort of great outline, the reſt being diverſified by trees variouſly diſpoſed, ſo as to produce the moſt natural effects. Other uſeful improvements were alſo gradually introduced as he became more freed from the fetters of the age that had preceded him. But the circumſtance that led to the principal improvements that immediately ſucceeded, was the diſcovery of the means of avoiding the neceſſity of walls as boundaries, in the forming of ſunk-fences, called *ha ha's* by the common people, as expreſſive of ſurprize at being imperceptibly ſtopped in their progreſs. This mode of fencing had ſcarcely been introduced before the practices of levelling, rolling, mowing, &c. ſucceeded it. According to ſir William Temple, the adjoining ground of the park on the outſide of the ſunk-fence was to be in ſome meaſure made to harmonize with the ſhort graſſed lawn on the inſide; and the garden, in its turn, to be ſet free from its prim regularity, in order to aſſort with the more wild country without. "The ſunk-fence aſcertained the ſpecific garden; but that it might not draw too obvious a line of diſtinction between the neat and the rude, the contiguous out-lying parts came to be included in a kind of general deſign; and when nature was taken into the plan, under improvements, every ſtep that was made, he conceives, pointed out new beauties, and inſpired new ideas."

Things were in this ſtate when Kent appeared, who, Mr. Walpole, in his hiſtory of gardening, ſubjoined to the "Anecdotes of Painting," ſays, was "painter enough to taſte the charms of landſcape, bold and opinionative enough to dare and to dictate, and born with a genius to ſtrike out a great ſyſtem from the twilight of imperfect eſſays. He leaped the fence, and ſaw that all nature was a garden. He felt the delicious contraſt of hill and valley changing imperceptibly into each other, taſted the beauty of the gentle ſwell or concave ſcoop, and remarked how looſe groves crowned an eaſy eminence with happy ornament; and, while they called in the diſtant view between their graceful ſtems, removed and extended the perſpective by deluſive compariſon. Thus," continues he, "the pencil of his imagination beſtowed all the arts of landſcape on the ſcenes he handled. The great principles on which he worked were perſpective, and light and ſhade. Groups of trees broke too uniform or too extenſive a lawn; evergreens and woods were oppoſed to the glare of the champaign; and, where the view was leſs fortunate, or ſo much expoſed as to be beheld at once, he blotted out ſome parts by thick ſhades, to divide into variety, or to make the richeſt ſcene more enchanting, by reſerving it to a further advance of the ſpectator's ſtep. Thus, ſelecting favourite objects, and veiling deformities by ſcreens of plantation, ſometimes allowing the rudeſt waſte to add its ſoil to the richeſt theatre, he realized the compoſitions of the greateſt maſters in painting. Where objects were wanting to animate his horizon, his taſte as an architect could beſtow immediate termination. His buildings, his ſeats, his temples, were more the works of his pencil than his compaſſes. We owe," Mr. Walpole conceives, "the reſtoration of Greece and the diffuſion of architecture to his ſkill in landſcape."

His management of water was admirable, and calculated to introduce innumerable beauties on the face of nature. He bade adieu to all the ſtiff formal modes of canals, circular baſins, and caſcades tumbling down marble ſteps, "that laſt abſurd magnificence of Italian and French villas;" nor was the forced elevation of cataracts any more viſible. The placid ſtream was now directed to move in a ſerpentine courſe, apparently, in a natural manner, being concealed by properly interſperſed thickets, where interrupted by the difference of levels, ſo as to ſhew itſelf again in its gliſtening progreſs at ſome naturally expected diſtance. The borders were indeed ſmoothed, but all their features of waving irregularity effectually preſerved. The edges of the banks were occaſionally ſtudded with trees, to remove their ſameneſs; and, where its meandering courſe diſappeared among hills, ſhades deſcending from the heights inclined towards its progreſs, and framed the diſtant point of light under which it was loſt in turning in either direction.

Dealing, in this way, in none but the true colours of nature, and ſeizing upon its moſt intereſting features, a new creation was gradually preſented to the man of taſte. "The living landſcape," ſays Mr. Walpole, "was chaſtened or poliſhed, not transformed. Freedom was given to the forms of trees; they extended their branches unreſtricted; and where any eminent oak, or maſter beech, had eſcaped maiming, and ſurvived the foreſt, the buſh and bramble were removed, and all its honours were reſtored to diſtinguiſh and ſhade the plain. Where the united plumage of an ancient wood extended wide its undulating canopy, and ſtood venerable in darkneſs, Kent thinned the foremoſt ranks, and left but ſo many detached and ſcattered trees as ſoftened the approach of gloom, and blended a chequered light with the thus lengthened ſhadows of the remaining columns." But, with all his merit, Kent had many faults and imperfections; he frequently left the houſes too naked and expoſed; having followed and imitated nature with ſo much happineſs and ſucceſs, he knew not where to ſtop, but often puſhed his reformations much further than was juſtified by correct principles and true taſte.

Theſe defects have not only been corrected and improved, but a new and maſterly finiſhing applied by the taſte and genius of ſubſequent profeſſors, among whom may be ranked the names of Price, Knight, London, &c. The ſtrenuous and ſucceſsful attempts of ſome of the earlier deſigners, with thoſe of more modern times, have indeed not merely given a ſort of currency to a variety of improvements in the art of ornamental gardening, but introduced a much more natural and picturesque ſyſtem, and greatly contributed to the expulſion of the ſtiff formal practice of the Dutch ſchool, as well as that of Brown and his followers of more recent periods, the abettors of what they term "landſcape gardening." This is beautifully ſhewn in the lines below, which were left written on a

ſeat

ſeat at Havod, the elegant reſidence of Thomas Johnes, eſq. Cardiganſhire.

"Far hence! let Repton, Brown, and Eames
Zig-zag their walks, and torture ſtreams;
But let them not my dells profane,
Or violate my Naïad train;
Nor let their arrogance invade
My meaneſt Dryad's ſecret ſhade,
And with fantaſtic knots diſgrace
The native honours of the place;
Making the vet'ran oak give way,
Some ſpruce exotic to diſplay.
Their petty labours be defy'd
Who *taſte* and *nature* would divide."

Much effect has been produced in the richneſs and variety of our rural ſcenery by the gradual introduction of foreign trees, ſhrubs, and plants by different individuals, within the laſt half century, ſuch as thoſe of the fir, pine, larch, and others of ſimilar growth, and likewiſe the great number of tall, hardy, bold, and varied-leaved vegetables, natives of different countries and climates. The beauty and diverſity of colouring afforded in this way, in ſome inſtances, are highly curious and intereſting, but conſiderable taſte and attention are requiſite to introduce them with propriety, and ſo as to produce the beſt and moſt ſtriking appearances.

The improvers of culinary gardening have not been fewer in number, or leſs diſtinguiſhed by the utility and importance of their diſcoveries and improvements, than thoſe of the ornamental claſs. The more early gardeners of this kind ſeem, however, to have been much confined by the rules and abſurd reſtrictions of the art, and to have moved in but a very narrow ſpace. They only knew the proper methods of raiſing and cultivating a very limited number of herbs, roots, and plants, and theſe often in very imperfect ſtates. In this country the Dutch practice continued to remain for a great length of time, probably nearly to the period at which gardening became reduced into a much more regular order by the exertions of Miller and thoſe who immediately ſucceeded him; ſince which time it has continued to advance with more accelerated progreſs, and received the aid of much ſcientific improvement. The number of plants, herbs, roots, and fruits, cultivated here, have been greatly increaſed, and better methods of managing them introduced. The machinery of the art has been formed on more juſt and convenient principles, and the neceſſary buildings erected with more ſcientific views. In theſe intentions the writings of Speechly, Nicol, Anderſon, Forſyth, Knight, London, &c. as well as the publications of the writers of calendars, have been of conſiderable utility. It has, however, been lately aſſerted by an able writer, "that there ſcarce exiſts a ſingle ſpecies of eſculent plant or fruit, which (relative to the uſe of man) has yet attained its utmoſt ſtate of perfection: nor any branch of practical horticulture which is not ſtill ſuſceptible of eſſential improvement."

The late eſtabliſhment of a Horticultural Society in London is a circumſtance that promiſes much advantage to the art, and neceſſarily holds out more extenſive and beneficial improvements in its different departments.

This may be more confidently looked for, ſince the efforts of ſmall provincial aſſociations have been ſo particularly ſucceſsful in this way. In Lancaſhire the culture of the gooſeberry and onion have been thus carried to ſtates of perfection that are wholly unknown to the more ſouthern diſtricts of the kingdom. And it is not improbable but that the ſame thing may have happened in other ſituations from ſimilar cauſes.

Ornamental and *Culinary Gardening* have now indeed been brought to a ſtate of improvement in this kingdom that certainly render them deſerving of no mean rank among the liberal arts, though the former takes in a much wider range, and embraces a much greater number of objects than the latter.

Principles and Materials of Ornamental Gardening.—The principles and objects of *ornamental gardening* are principally thoſe of improving and rendering the ſcenes of nature more amuſing and agreeable by the application of correct taſte, and the judicious management of the different materials that are employed, which is effected by ſelecting, arranging, combining, diſpoſing, and exhibiting them in different ways, according to the nature of the places and other circumſtances. It may, in ſome meaſure, be diſtinguiſhed into pleaſure or flower gardening, the culture of wild plants and flowers, and the management of flowering plants of the ſhrub kind.

The materials of the art may be chiefly conſidered to be thoſe of lawn, ſand, gravel, ſoil, water, ſtones, rocks, woods, trees, ſhrubs, and flowers. There are a few others alſo that may be occaſionally made uſe of in this ſort of gardening, but they require much caution in their introduction. Theſe are moſtly of the ſtatue, inſcription, and other ſimilar kinds; buildings, ſeats, archways, &c.

Where ſingle objects are diſplayed, they are generally intended to ſhow ſome of the minor beauties, ſuch as thoſe of the flower or fruit kinds, and are, conſequently, placed in the moſt conſpicuous parts, and in ſuch modes as muſt neceſſarily excite attention in thoſe who may paſs. This is, perhaps, the loweſt branch of this department of gardening, and may have a reference to the nature, mode of growth, and form of the plants, as well as to the fruits and the ſhades of the foliage: ſometimes alſo to the whole in combination.

Another principle of this ſpecies of gardening is that of exhibiting beauties in a congregated, or collective manner, which is accompliſhed either by means of *arrangement*, or what is termed *grouping*.

Mr. London, in his uſeful treatiſe on "Country Reſidences," offers numerous juſt and intereſting remarks upon theſe different methods. Arrangement, he conceives, capable of being effected either "upon the principles of botany, of culture, of general nature, or artificial borderings." The firſt of which may be as various as the different ſyſtems which have been invented by botaniſts, whether natural or artificial, and "is employed in botanic gardens, or collections either of trees or plants." The ſecond mode "refers chiefly to ſuch plants or trees as require a particular attention with regard to ſoil, climate, &c." It includes "all the bulbous-rooted flowers, tender herbaceous plants, American plants and trees, and, in ſome inſtances, exotics," eſpecially "the firſt claſs, which are always, when in a cultivated ſtate, guided by it, as in Dutch parterres, &c." But he thinks "the arrangement univerſal in nature, is what will be moſt pleaſing to general admirers." Its principles are perfectly ſimple; being nothing more than this, "that one kind of objects, beauties, or characters, always prevails in one place: and that when another ſucceeds, it is generally done in a gradual manner, the interval between them being compoſed of characters, or beauties, irregularly blended together; which is beautifully illuſtrated throughout all nature, whether animal, vegetable, or mineral." It is, however, aſſerted to be a method that "has hitherto been totally neglected, as moſt of nature's laws have been in this branch of ſcience; while in its place is ſubſtituted, by cuſtom and ignorance, a mode of arrangement totally inconſiſtent with nature or good taſte," that of "the vulgar mode of mixing

different

different ſpecies together indiſcriminately; not only without the ſmalleſt regard to connection or difference of character, but in ſtudied oppoſition to it," as is ſeen in numerous inſtances of green-houſes, flower-gardens, ſhrubberies, and general planting. This is a principle the moſt generally applicable in this ſort of gardening, Mr. London thinks, "whether we regard their general diſtribution into lawn, flowers, and ſhrubs; or the ſmaller parts, compoſed of flowers, or ſhrubs only." And it is maintained that, "even a collection of beauties, exhibited ſingly, may ſtill be contrived agreeable to this principle. Thus, in a plot of finely varied auriculas, each minute variety may be kept by itſelf, and the ſame often (though not always) in beds of tulips, hyacinths, and ranunculuſes."

Grouping, it is obſerved, is the means by which "variety, intricacy, and harmony" are effected, and is capable of being "applied either to objects of the ſame kind, in which the chief principle is contraſt of the parts, or to objects of different kinds, in which the chief principle is diſpoſition or contraſt of different objects." This mode "is applicable to all the larger ſcenes" of this ſort of gardening, "in connection with all the natural principles of arrangement, except *culture* and *bordering*, where it would cauſe much inconvenience in pulverizing the ground." And "even there it may frequently be introduced with advantage and effect; but conſiderable judgment is requiſite to decide when ornamental effect ſhould give way to convenient culture. In ſhrubberies, and ſcattered trees or ſhrubs, either alone, or ſeen in *connection* with any other of the materials" of this deſcription of gardening, it "is an indiſpenſable requiſite, and can never be omitted, without foregoing one of the greateſt beauties of nature; one that is univerſally prevalent in every variety of natural ſcenery, which is inſtantly perceived, and ſo highly faſcinating to the man of taſte, that no other beauty can compenſate for its abſence." The beauty here meant is connection, "which, according to the objects connected, may either produce order, variety, intricacy, or harmony." This beauty is, however, ſuppoſed to be little felt by gardeners from ſeveral cauſes. Yet "the principles of natural effects are univerſal in their application, even with regard to utility. Theſe principles, and alſo the imitation of the effects produced by the extremes of their operation, will ever be the true criterion of beauty in the arts of taſte, or in ornamental productions."

The principal ſubjects of this ſpecies of gardening are thoſe of parterres, which are of ſeveral different kinds; hot-houſes, or ſtoves of different ſorts, conſervatories, green-houſes, &c. See theſe ſeveral heads.

There are alſo ſome others, ſuch as "ſmall groups of ſhrubs and flowers placed upon lawns, ſhrubberies, and pleaſure-grounds." The firſt, it is remarked by the author of the treatiſe on "Country Reſidences," when made uſe of in ſuch ſituations, "ſhould always be of very irregular ſhape;" but, "when upon gravel, this muſt depend upon circumſtances. If, in a part where art is avowed and ought to prevail, then the more artificial the form ſo much the better; but if merely a group for dividing or varying a road, walk, or natural path, at a diſtance from artificial ſcenes, then it ſhould be as irregular as thoſe upon a lawn." In general, "whether theſe groups are made regular or irregular, they require to be cultivated for ſome years afterwards;" which, "according to the preſent mode of digging them, produces a harſh and diſagreeable boundary line;" which, it is ſuppoſed, ſhould be deſtroyed as much as poſſible. This is ſaid to be eaſily effected by keeping "the earth on the margin of the group of the ſame level as the lawn or paſture, and to let both blend harmoniouſly together." Groups of this nature being only dug till the growth of the ſhrubs render it unneceſſary; it is ſuggeſted, that "the paſture ſhould be allowed gradually to encroach among the ſhrubs and flowers, until at laſt it wholly covers the ſurface." After this, the group becomes rough and pictureſque; the flowers, ſtill continuing to grow among the ſhrubs, will produce exactly what we ſee in natural groups, with only the "elegant difference" of having fine ſuitable plants inſtead of coarſe weeds.

Where ſhrubs are employed in this grouping way, it is obſerved, that "the great art is to put them in irregularly; for though the outline of the ground to be cultivated muſt, even under the beſt taſte, be ſomewhat formal, yet the ſhrubs can always be planted as irregularly as if no outline or form of group exiſted. This, however, is a thing never done; for whatever be the form of the ground which is to be dug, the ſhrubs are regularly diſtributed over every part of it: even when digging is no longer attended to, ſtill none of the ſhrubs are thinned out, but the whole left a formal, unconnected clump of vegetation; an appearance, it is remarked, as different from the irregular group-thickets of nature, as a green hillock is from a rocky precipice." It is admitted that "groups, or rather maſſes of formal ſhapes, ſuch as ovals in front of ſmall villas, or baſket-work patches upon a lawn in the front of a manſion, muſt always have determinate outlines, as being devoted chiefly to tender flowers and flowering ſhrubs, they will always require to be cultivated. Their outlines may either be formed of elegant maſonry, wood, baſket-work; or flowers, as thrift, daiſy, &c., or often a broad margin of turf, when ſurrounded by gravel." And it is ſuggeſted that "the general form of theſe maſſes may be oval, circular, pentagonal, or fanciful, according to pleaſure; and their ſurface may either be kept level with the lawn, or gradually raiſed from the margin to the centre. But when raiſed in this way, it is ſuggeſted, that the ſides ought always to preſent a concave ſlope, and not a convex one, as they commonly do, and which has a very bad effect." It is concluded, however, in reſpect to groups, "that neither thoſe of irregular, or of regular ſhapes, ought ever to be placed but where they have a proper relation and union with what ſurrounds them."

In regard to ſhrubberies, or the narrow belts or ſtrips of ſhrubs and flowers which occaſionally form the main ornament of ſmall reſidences, they are ſuppoſed uſeful in their effect, when executed according to the principles of nature and good taſte, though their "tawdry inſipidity" has been reprobated by Mr. Knight. They are commonly formed for the purpoſe of getting a walk to ſome particular ſituation or place, as the kitchen-garden, farm, wood, &c. or merely through the ſhrubbery for its own ſake, and ſuch views as it may afford. On this principle three things are conſidered neceſſary in forming them; the firſt of which is, that of "the arrangement and grouping of the trees, which ought to be that of general nature." The ſecond is that of "the intermixture of glades and paſture, which in moſt caſes is an eſſential requiſite." And the third, that of "the judicious introduction of views of more diſtant ſcenery;" which is moſt frequently deſirable, unleſs in ſuch parts as, by way of contraſt, are preſerved in umbroſity. This is "naturally connected with pictureſque improvements," and depends upon the general principles of this ſort of gardening. See SHRUBBERY.

Pleaſure-grounds are deſtined to comprehend a great variety of intereſting ſcenery of different kinds, introduced for the purpoſes of ornament, convenience, and utility; which are ſuggeſted as admitting of being arranged on the general principles of convenience, connection, particular

lar expreſſion, and pictureſque effect. See PLEASURE-*Ground.*

Culinary gardening is that branch of the art which comprehends the various methods of producing all ſorts of fruits, as well as uſeful vegetables, roots, herbs and plants for the ſupport and luxury of mankind. It is a ſort of cultivation moſtly confined within rather narrow limits, and which is performed in a great meaſure by human labour.

Principles of Culinary Gardening.—Its principles chiefly depend upon a correct knowledge of the nature, general economy, habits and modes of fructification of plants, trees, &c. in combination with thoſe of the proper preparation of the ſoil, the methods of cropping, and the management which is neceſſary afterwards. It is likewiſe capable of deriving great aſſiſtance from the application of different arts and ſciences.

Preparation of the Soil.—The proper performance of this depends upon a variety of circumſtances, ſuch as the nature of the land, the kind of crop that is to be cultivated, and the ſeaſon at which it is put in. After the primary operations of clearing and draining have been executed, it is generally neceſſary to break down and reduce the earth into a fine ſtate of mould by common or trench-digging; and the expoſure of a large ſurface to the action and influence of froſt, or the effects of heat and moiſture in alternation, as in ridging and ſummer-trenching. See RIDGING and TRENCHING.

There are other modes that contribute to the production of the ſame effect, ſuch as the growth of particular ſorts of crops, as celery, and thoſe of the carrot, parſnip, beet, and others of the tap-rooted kind: and the application of ſtrong hand-hoes to the ſuperficial parts at proper periods, as when the ſoil has a diſpoſition to fall down in a powdery condition. This laſt method will likewiſe at the ſame time extirpate and deſtroy a number of weeds, but the neceſſity of this ſhould be conſtantly well guarded againſt, by ſuffering none to run to ſeed in the garden.

Conſiderable advantage may alſo be gained in the view of rendering garden ground mellow, by the proper application of ſuitable manure. In this view the manure ſhould not have advanced too far in the ſtate of decompoſition. Compoſts and very rotten manures produce but a trifling effect in this way, though highly beneficial in various other reſpects. It ſeems not improbable but that, in hot ſeaſons, where the ſoil is inclined to be heavy and of courſe lumpy, benefit might be derived from the uſe of a ſmall roller upon the ſurface.

How far advantage is capable of being derived from the *reſting* of the ſoil in this ſort of culture, is perhaps not yet fully aſcertained; but certain kinds of garden crops are commonly ſuppoſed to grow better on new land than ſuch as have been long under cultivation, as thoſe of the onion, the carrot, the turnip, and the potatoe kinds. Therefore different methods of effecting this purpoſe have been propoſed, ſuch as laying down portions of garden-ground annually with grain and graſs ſeeds, and breaking others up. This can, however, be only practiſed in large gardens, either with convenience or the proſpect of ſucceſs; and in all caſes muſt be employed with much caution.

Another mode is by trenching to different depths alternately, as three and two ſpits, ſo as to have new or freſh ſurfaces from the top, middle, and bottom, cropping each three years, and letting the future ſurfaces reſt ſix. This practice has been recommended by Mr. Walter Nicol. But it can only be had recourſe to in particular inſtances, as few gardens admit of three ſpits' depth of good ſoil. Beſides, the expence of performing it affords a conſiderable objection.

Succeſſion of Crops.—This is a matter of conſiderable importance in culinary gardening, as the growth of good and healthy vegetables, and the keeping of the ſoil in a proper ſtate of heart, in a great meaſure, depends upon it. The main principle on which it proceeds is that of never growing what are termed exhauſting crops in ſucceſſion; or letting two or three of the ſame nature or ſort follow each other. It is well known to horticulturiſts, that under ſuch circumſtances they conſtantly become deteriorated in quality, and greatly leſſened in the quantity of produce. The cloſeneſs of ſhade afforded by the plants is alſo another principle that ſhould be carefully attended to in managing this buſineſs. In this practice it has been ſuggeſted by Mr. London that "the vegetables cultivated ſhould be divided into claſſes according to their reſpective *natures*, *modes of culture*, and *duration*." It is conceived that in reſpect to *natures*, they may be divided into, 1ſt. Such as have ramoſe roots, as the cabbage, cauliflower, brocoli, &c. 2d. Such as have fuſiform roots, as the carrot, beet, parſnip, &c. 3d. Such as are ſquamoſe, as the onion, leek, eſchalot, &c. 4th. Such as are fibrous, as the lettuce, endive, &c. 5th. Such as are tuberoſe, as the potatoe, Jeruſalem artichoke, &c. They are ſuppoſed capable of further diviſion, "into ſuch as partake of two of theſe diviſions, as the fuſiform and fibrous, exemplified in the bean, pea, kidney-bean, ſpinach, &c. &c."

The writer adds that "ſome crops require to be cultivated in large quantities, as peaſe, turnips, onions; others in ſmall portions, as moſt ſallad and pot-herbs. Some require very rich ſoil, and generally manure previouſly to planting or ſowing, as celery, cauliflower, and leeks; others require a tolerably rich ſoil, but are much injured by manure immediately previous to their inſertion, as carrot, beet, and moſt eſculent roots of fuſiform ſhapes."

In regard to *modes of culture*, it is ſuggeſted that culinary vegetables may be diſtinguiſhed "into, 1ſt, ſuch as are ſown upon the ſurface broadcaſt, as onions, turnips, ſpinach, &c. 2d. Such as are ſown or planted on the ſurface but in drills, as peaſe, beans, and potatoes. 3d. Such as are placed in hollow trenches, as celery, and ſometimes artichokes. 4th. Such as are ſown or raiſed on beds or ridges, as aſparagus, ſea-kale, and frequently early crops of peaſe, &c. 5th. Some require the ſoil to be often pulverized while growing, as potatoes, peaſe, and moſt drill-crops; others admit of it but in a ſmall degree, as onions, leeks, carrots, &c. Some are occaſionally and often materially injured by it, as ſtrawberries."

In relation to *duration*, it is obſerved that ſome are ſown and removed within three months: as early crops of turnips, radiſhes, braſſica plants, for removal, &c.; others continue double that time, as onions and potatoes; others treble, as frequently brocoli and cabbages; ſome continue two ſeaſons, as parſley, fennel, &c.; others for ſeveral years, as ſtrawberries, aſparagus, artichokes, &c. By attentively conſidering theſe and other diviſions which the ſubject admits of, it is ſuppoſed much advantage may be gained by the culinary gardener, and appropriate ſucceſſions of crops formed: "thus celery, by being planted in hollow trenches, pulverizes the ſoil in a high degree; by requiring a conſiderable quantity of manure it enriches it; both which properties are neceſſary for the production of plants of large, ramoſe, or faſciculate roots, which penetrate deep into the ſoil, ſuch as artichokes, ſcorzonera, aſparagus, &c. Again, theſe crops by remaining long on the ſoil, afford, when removed, an excellent ſituation for ſuch as are

more tranſitory, as peaſe, potatoes, &c." There are various other circumſtances that are deſerving of attention on this ſubject, as may be ſeen by conſulting the articles CROPPING and COURSE *of Crops*.

After-management.—There are ſcarcely any two plants that require exactly the ſame means in the whole of their cultivation, though in many inſtances the differences are but very ſmall. In the annual and biennial kinds, the ſimilarity in many caſes is very conſiderable; but in that of the perennial ſallad and pot-herb ſorts it moſtly differs in a high degree. The neceſſary culture in each may be under the names of the particular plants. Whatever the nature of the culture that is requiſite may be, in any ſort of plant or vegetable, it ſhould always be executed in due ſeaſon, and under proper circumſtances in reſpect to the ſtate of the ground. There are ſeveral other matters in the performance of this buſineſs that require the attention of the gardener, as will be ſeen under their proper heads.

Uſeful and important alterations and changes are capable of being produced in vegetables, by diverting their natural and uſual habits of growth and production. A very plain and eaſy method of accompliſhing this, in many caſes, is by ſetting and ſowing, at unuſual periods, as between thoſe in which it is uſually performed. The ſame thing is alſo capable of being effected by making uſe of different ſorts of ſoil for the purpoſe, as ſuch as are more early or late, in conſequence of their natural qualities. As the great or final purpoſe of every individual vegetable is that of the production of its flower, fruit, and ſeed, it naturally purſues its growth till theſe ends are fully effected; which is the caſe in very different lengths of time, according to the kind of plant or tree, being ſhort in ſome, while in others it takes up a very conſiderable length of time. In this view, by cutting the annual and biennial ſorts, ſo as to prevent theſe from taking place, they may be continued for ſeveral years. And in ſome caſes perennials may be made to afford crops at unuſual ſeaſons. The ſame thing happens to ſome fruit trees and ſhrubs when denudated of their leaves and flowers in the late vernal ſeaſon.

In different fruit-trees that do not uſually afford any produce for a great length of time, as the walnut and mulberry, it has been found by Mr. A. Knight, that by grafting them by approach with the bearing branches of old trees, they may be brought into bearing in the courſe of three years; and it is ſuggeſted that this method may probably be applied with ſucceſs in various other ſimilar caſes. See GRAFTING.

The practical operations of this branch of gardening divide themſelves under a variety of different heads, as conſervatory, eſpalier, green-houſe, hot-bed, hot-houſe, hot-pit, hot wall, muſhroom-houſe, orchard, planting, pruning, ſtandard-trees, training, vermin, wall-fruit, wall-tree, watering, watering-engine, weeding, &c.

GARDENING, in *Falconry*. To *garden a hawk*, is to put her on a turf of graſs, to cheat her.

Some alſo uſe the ſame phraſe for the giving her an airing, or letting her fly at large.

GARDENSEE, in *Geography*, a town of Pruſſia, in Oberland; 25 miles N.N.E. of Culm. N. lat. 53° 35'. E. long. 18° 43'.

GARDENSK, a town of Samogitia; 25 miles S. W. of Miedniki.

GARDENSTOWN, a ſmall town of Scotland, in the county of Bamff, ſituated in a bay at the entrance into the frith of Murray, with an harbour chiefly adapted to fiſhing-boats and ſmall veſſels; ſeven miles E. of Bamff. N. lat. 57° 37'. W. long. 2° 15'.

GARDICCHI, a town on the weſt coaſt of the iſland of Corfu; ſeven miles S.W. of Corfu.

GARDIE, PONTUS DE LA, in *Biography*, who flouriſhed in the middle of the 16th century, was ſon of a gentleman of Gardie, near Carcaſſone, in France. He ſerved firſt under marſhal Briſac in Piedmont, and afterwards in the troops ſent to Scotland by king Henry II. After this he went into the Daniſh ſervice, and was taken priſoner in an action againſt the Swedes. The Swediſh general, who was himſelf a Frenchman, recommended Gardie to the king, who immediately gave him a commiſſion in his army. He was afterwards knighted and created baron of Eckholm, and was ſent by John, king of Sweden, as ambaſſador to the emperor Rodolph, and to pope Gregory XIII. In 1580 he was made general of the Swediſh army in a war againſt the Ruſſians, from whom he took ſome important places. The government of Ingria and Livonia was conferred upon him for his great ſervices, and he proceeded in a career of ſucceſs, and was honoured with other important offices. In 1585 he was unfortunately drowned at the entrance of the port of Revel. He had married a natural daughter of the king, and from this union are deſcended the counts de la Gardie, who are among the principal nobles of Sweden. Moreri.

GARDINER, STEPHEN, an Engliſh prelate and ſtateſman, who flouriſhed in the ſixteenth century, and who, by the part which he took in the reign of Mary, has had his name tranſmitted with infamy to poſterity. He was a native of St. Edmunds Bury, and born about the year 1483. He is ſuppoſed to have been the natural ſon of Dr. Lionel Woodvill, biſhop of Saliſbury, and brother to Elizabeth, queen conſort to Edward IV. He took his ſurname from his reputed father, a menial ſervant of the biſhop, who married his mother with a view of preventing the conſequences which would have reſulted, had the real ſtate of the caſe been known. Of the early years of this remarkable man we have no account; but at the proper age he was ſent to Trinity-Hall, Cambridge, where he purſued his ſtudies with uncommon diligence, and in a ſhort time obtained a high degree of reputation for the brilliancy of his talents, for correctneſs and elegance in writing and ſpeaking Latin, and for extraordinary ſkill in the Greek language. As a claſſical ſcholar he read inceſſantly the works of Cicero, and imitated his ſtyle ſo cloſely, as to draw down the ſeverity of criticiſm on that account. He applied himſelf to the ſtudy of the civil and canon law, and took his degree of doctor in the year 1520. Different ſtatements are made reſpecting his firſt patron: according to ſome, it was Thomas Howard, duke of Norfolk, though others aſcribe the notice taken of him to cardinal Wolſey. To the latter it is known that Gardiner acted as a private ſecretary, and was for ſome time one of the cardinal's family. In this ſituation an incident happened which introduced him to the knowledge of the king. Cardinal Wolſey having projected an alliance with Francis I. king of France, Gardiner was employed to draw up a plan of it. While he was engaged upon the work, the king choſe to examine the progreſs which was made by the ſecretary, and being well pleaſed with the performance, and ſtill more with his converſation, and with his fitneſs for buſineſs, he not only expreſſed his ſatisfaction of the young man's talents, but admitted him into a confidential intercourſe, and from this period ſcarcely any ſtate affair of moment was concluded without the advice of Gardiner. In the year 1527, or 1528, he was appointed, in conjunction with Edward Fox, to an embaſſy to Rome, to negociate the buſineſs of the king's divorce from queen Catherine. Although Fox would naturally rank higher than his

his coadjutor, yet Gardiner, being eſteemed the beſt civilian in England, was appointed chief of the embaſſy, and having been already admitted into the king's cabinet council for this affair, was ſtyled in the cardinal's credentials to the pope, "Primary Secretary of the moſt ſecret counſels." The cardinal calls Gardiner "the half of himſelf, than whom none was dearer to him," and he aſſured the pope he might ſay with the utmoſt ſafety to Gardiner whatever he would deliver to himſelf. At firſt the pope ſeemed to be playing a double game, but by the repreſentations and addreſs of Gardiner he at length obtained a commiſſion from his holineſs, appointing cardinals Wolſey and Campeggi to determine the buſineſs in their own way. For this important ſervice Gardiner was highly applauded by his maſter, by the king, and by Anne Bullen, who under her own hand aſſured him ſhe felt every diſpoſition to render him all the grateful returns in her power. Having ſent home his colleague Fox, the ſecretary remained at Rome, hoping to ſecure the papal crown for Wolſey, to which he had long aſpired, and which the dangerous illneſs of Clement VII. gave him ſome hopes of attaining. Gardiner acted with ſo much zeal and diſintereſtedneſs on this occaſion, that he ſecured the ſuffrages of at leaſt one-third of the whole number of cardinals. The recovery of the pope put an end for a time to the hopes of the contending parties; nevertheleſs the cardinal was aware of the great obligations he was under to Gardiner for the zeal which he had ſhewn in his behalf: nor was he leſs pleaſed with him for reconciling the pope to the endowment of his two colleges at Oxford and Ipſwich out of the revenues of the diſſolved leſſer monaſteries. Gardiner was recalled from Rome to manage the king's cauſe of divorce before the legates, and immediately on his return he was appointed to the archdeaconry of Norfolk, which was the firſt inſtance of his preferment in the church, but on account of his great uſefulneſs to the ſovereign he was raiſed to the office of ſecretary of ſtate. In this ſituation he was conſidered as having a large ſhare in the management of all important affairs, and was particularly conſulted by the king when cardinal Campeggi declared that the cauſe of the divorce muſt be ſent back to Rome, and that himſelf and his colleague could proceed no farther. Gardiner, by the aſſiſtance of archbiſhop Cranmer, found a method of extricating the king from his difficulty. (See CRANMER.) The new method of proceeding in this buſineſs contributed to haſten the ruin of Wolſey, who had ſome time been ſuſpected by the monarch of being inimical to the divorce. In his diſtreſs the cardinal had recourſe to his old ſervant, the ſecretary, from whom it is believed he met with as ſincere returns of gratitude and real friendſhip as he could deſire or expect. In the year 1530 Gardiner was employed, in conjunction with Fox, to procure from the univerſity of Cambridge a declaration in favour of the king's cauſe. He was at this time maſter of Trinity Hall, and by the influence which this office gave him they ſucceeded in their plans. For this and for his other ſervices in behalf of the king he was rewarded by very valuable eccleſiaſtical promotions, till at length, in 1531, he was conſecrated biſhop of Wincheſter. In 1533 the new prelate ſat in the court with archbiſhop Cranmer, when the latter pronounced the ſentence by which queen Catherine's marriage was declared null and void. In the ſame year he was ſent ambaſſador to France, whither he was ſoon followed by Dr. Bonner. The object of this journey was to attend an interview between the pope and the French king at Marſeilles, and to diſcover their deſigns, which Henry and his council ſuſpected to be of a hoſtile nature againſt England. They did not, on this occaſion, ſcruple to declare that Henry VIII. would appeal to a general council, if the pope ſhould pretend to proceed to judgment in his cauſe. Upon the return of biſhop Gardiner he was called upon, with the other biſhops, to acknowledge the king as ſupreme head of the church, and to take the oath appointed for that purpoſe. With this ſummons he not only complied with the utmoſt readineſs, but publiſhed a defence of the king's ſupremacy. His pen was made uſe of upon other occaſions, in vindicating the king's divorce, his ſubſequent marriage, and his emancipation of the kingdom from the tyranny of the papal ſee, upon which ſubjects his various treatiſes obtain him a high degree of reputation. Gardiner was, however, zealouſly attached to the ſuperſtitions of the Romiſh church, and oppoſed with all his ſtrength any attempts made to introduce the principles of the Proteſtant reformation. In the year 1535 he was warmly engaged with Cranmer, who had ſent him notice that he ſhould viſit his dioceſe, and who had made a propoſal in the convocation to petition the king for leave to make an Engliſh tranſlation of the bible. About this period Gardiner reſumed his embaſſy to France, where he prevailed on the French king to remove from his dominions Dr. Reginald Pole, then dean of Exeter, a circumſtance that gave riſe to the animoſity which afterwards ſubſiſted between theſe churchmen. At this period he entered a ſtrong proteſt reſpecting a project of a religious league with the Proteſtant princes of Germany. In 1538 he was ſent ambaſſador to the German diet of Ratiſbon, where he acquitted himſelf with much credit as to the objects of the commiſſion, but he there fell under a ſuſpicion of holding a ſecret correſpondence with the pope, on the ſubject of rendering popery triumphant in England. But Henry was ſtill too much attached to the doctrines of Rome to bring his prelate into any trouble on account of his zeal on this ſubject: he even took pains, notwithſtanding his hoſtility to the court of Rome, to prevent his ſubjects from departing from their old eſtabliſhed creed. In ſome caſes he had recourſe to the aid of perſecution in juſtification of the cauſe of popery. John Lambert had written a paper againſt the doctrine of the real preſence, which fell into the hands of archbiſhop Cranmer, before whom and biſhop Latimer he was ſummoned, and there admoniſhed to retract what he had written. Lambert was not to be intimidated, as he could not be convinced; he appealed to the king, who, by the advice of Gardiner, cited him to appear in Weſtminſter-hall. Here the king ſat in great ſtate, ſurrounded by the biſhops, nobility, clergy, and council: a long debate enſued, in which the honeſt man was overwhelmed by the multitude of his opponents, and reduced to ſilence. Henry then demanded of him, if he were convinced, and whether he would live or die? He replied, with great humility, that "he committed his ſoul to God, and ſubmitted his body to the king's clemency." The king ſternly told him, for clemency never entered into the compoſition of Henry VIII., if he did not recant he muſt die, for he would not be a patron of heretics. Lambert was a hero, as well as an honeſt man; he refuſed to recant, and was burnt in Smithfield with circumſtances of uncommon cruelty. This tragical ſcene was unqueſtionably the reſult of Gardiner's advice, and on that account claims to be narrated in his life, though it muſt be again referred to. See HENRY VIII.

In 1539 Gardiner diſtinguiſhed himſelf by his exertions to procure the act of the ſix articles, commonly denominated the Bloody Statute; and very ſoon after the paſſing of this act, Dr. Barnes and two others were burnt in Smithfield for hereſy, at the ſame time that three papiſts were hanged for owning the pope's ſupremacy and denying the king's, which

cauſed the remark of a foreigner, "that in England there was a ſtrange method of managing matters, for thoſe that were the pope's adherents were hanged, and thoſe who were againſt him were burnt."

Upon the fall of Cromwell, in 1540, Gardiner was elected chancellor of the univerſity of Cambridge, in which ſituation he was the conſtant opponent of whatever was propoſed to be introduced in favour of improving the plans of education: he was the advocate for old cuſtoms and practices, becauſe they were old, though at the ſame time they might be vicious and abſurd. He even charged ſir John Clarke with endeavouring to remove "an evil well placed."

In 1542 a convocation was held to examine the merits of the tranſlation of the Bible. Gardiner and the popiſh party reprobated it as a moſt unfaithful verſion of the original, and to obtain a decree againſt it they offered to produce a better, fully expecting that the time requiſite for the accompliſhment of ſo great an undertaking, might afford fair opportunities for ſuppreſſing it altogether. Cranmer, however, had the addreſs to get it referred to the examination of the two univerſities; and, to the extreme mortification of Gardiner, he made ſome further progreſs in the work of reformation, by obtaining a mitigation of ſome of the ſevere acts concerning religion. Gardiner, about this time, was one of the commiſſioners appointed to conclude a treaty of peace with Scotland, and to negociate a marriage between the prince of Wales and the young Scottiſh queen; but in all his public employments he never loſt ſight of a favourable opportunity of impeding the progreſs of freedom and inquiry in religious concerns. With this view he probably employed perſons as ſpies upon the conduct of thoſe attached to the reformed principles; and, having been informed that ſeveral ſuch were to be found at Windſor, he moved the king in council that a commiſſion might be granted for ſearching ſuſpected houſes in that town, in which ſome books were found written againſt the ſix articles. Four perſons were apprehended, tried, and condemned for hereſy, of whom three were ſentenced to be burnt. After this, Gardiner himſelf fell under the ſuſpicion of the king, and an order was made out for committing him to the Tower; but the prelate, appearing in perſon in the preſence of his ſovereign, contrived to obtain a pardon before any ſteps could be taken to prove his guilt. In the year 1545 he oppoſed and defeated a deſign which Cranmer had formed, by a reviſion and reformation of the canon laws, to adapt them to the new order of eccleſiaſtical affairs in England, and to a period of ſtill further improvement. During this ſame year Gardiner was employed in Flanders to carry on political negociations with the emperor and the French king, and while he was abſent from the kingdom Cranmer endeavoured to obtain the king's conſent for the aboliſhing of ſome of the prevailing ſuperſtitions. Gardiner was appriſed of the plan, and writing to the king to ſay that his buſineſs was in a good train, he took that opportunity of earneſtly entreating him not to ſuffer any innovation in religion, for if he did there would be no hope left of ſucceeding with the emperor. Soon after Gardiner's return from the continent he contrived to ſet on foot a perſecution againſt the proteſtants upon the ſtatute of the ſix articles. A charge was firſt brought againſt Mrs. Anne Aſcough, a lady of unblemiſhed manners, exemplary piety, ready wit, and who had enjoyed the advantages of an excellent education. By making her the object of their perſecution, they expected to extort from her confeſſions which would furniſh matter of accuſation againſt ſome of the principal nobility and other high characters in the kingdom. After ſeveral examinations, in which the tortures of the rack were reſorted to, they condemned her to the flames, in which ſhe ſuffered, with three others, for ſpeaking againſt the real preſence. Sir George Blage, one of the gentlemen of the king's privy chamber, was likewiſe condemned to be burnt, but the king interfered and ſet him at liberty.

The next attempt made by Gardiner to cruſh the favourers of the reformation, which failed in its deſign, and which irrecoverably alienated the king's mind from him, was directed againſt Catherine Parr, to whom the king had been married three years. After this, Henry never admitted the biſhop into his preſence, excepting once, when he was informed that he came to tender him a benevolence, granted him by the clergy. On that occaſion he barely ſuffered him to approach, to deliver his meſſage, and when he had received it went into another apartment. So completely was the king alienated from Gardiner, that, though he had formerly appointed him one of his executors, and of the council to prince Edward, he now ordered a new will to be drawn, in which his name was omitted.

After the death of Henry, Gardiner, though the power was taken out of his hands, objected, as violently as ever, againſt the meaſures of reform which Cranmer was deſirous of introducing, and on this account he was impriſoned in the Fleet, where he was treated with much ſeverity. In this ſtate of confinement he continued to the end of the ſeſſion of parliament, when he was liberated by the king's pardon, though he had never been formally accuſed of any particular crime. Being ſet at liberty he repaired to his dioceſe, where he conformed himſelf, outwardly at leaſt, to the orders of the council, ſo that it was impoſſible to take any advantage againſt him; but no doubt was entertained that he did all that lay in his power, privately, to oppoſe the principles of the reformation. He even preached againſt them, and exhorted his people to beware of receiving any other doctrine than that which he had taught them. Of this conduct a complaint was made againſt him, in the council, before whom he was ſummoned in the year 1548, and, having been ſeverely reprimanded, was ordered to keep his houſe till he had given ſatisfaction, which was to be by preaching before the king, according to certain directions to be given him. On the day appointed he did preach, but his diſcourſe made the breach ſtill wider, and he was committed a cloſe priſoner to the Tower. Here he was detained two years, and then brought before the council, where he was informed that they ſat by a ſpecial commiſſion to judge him, and that he was required to ſubſcribe to the articles which had been ſent to him. Gardiner was inflexible, and refuſed; and, in conſequence of it, he was in the year 1551 deprived of his biſhopric for diſobedience and contempt of the king's authority. The biſhop proteſted againſt his judges, and objected to their commiſſion; and when ſentence was about to be given againſt him he appealed from the delegates to the king, but no notice was taken of the appeal. After this he was deprived of thoſe little indulgences, which had been before allowed him in his confinement, and he was kept priſoner in the Tower during the remainder of king Edward's reign. Here he ſpent his time in compoſing a variety of Latin poems, tranſlated into Engliſh verſe ſeveral of the poetical parts of the Old Teſtament, and wrote ſome controverſial tracts. He anticipated a change of circumſtances which ſhould put him in poſſeſſion of the degree of influence and proſperity that he formerly enjoyed. In the year 1553 his hopes were realized in the acceſſion of Mary to the throne of theſe realms. On the 8th of July, he was appointed to perform the Romiſh obſequies for the late king, who was buried at Weſtminſter, with the Engliſh ſervice, by archbiſhop Cranmer: and on the following day he reſumed the poſſeſſion of Wincheſter-houſe, after an abſence of five

years,

years, and on the 23d he was declared chancellor of England, and immediately became the queen's prime miniſter, and was entruſted with the chief management of public affairs. He now determined to re-eſtabliſh the popiſh religion, and to reconcile the kingdom to the ſee of Rome. Preaching, except by the queen's ſpecial licence, was inſtantly prohibited: images were ſet up by the popiſh party, and the old rites and the Latin ſervice were very generally introduced. Though the laws of Edward VI. were ſtill unrepealed, yet theſe practices, which were highly illegal, were connived at and abetted by the council, which, being modelled after Gardiner's own mind, harraſſed with impriſonment and very ſevere uſage, ſir James Hales, one of the judges who had ventured to inſtruct the juſtices in Kent, to put in execution the laws of Edward that were ſtill in force. The new government ſoon ſhewed a determined hoſtility to the Proteſtants, who, by the authority of Gardiner, were moleſted in the religious ſervices which the people attended with unuſual ſerioufneſs, under the apprehenſion that their liberties would ſoon be reſtrained. Spies were employed in all the churches in London, who, to pleaſe their ſuperiors, laid informations againſt the preachers. Theſe had no redreſs; they were obliged to ſubmit to the preſcribed terms, or were committed to priſon. October the 1ſt was appointed for the coronation of the queen, when a general pardon to all offenders was proclaimed, with the exception of thoſe who were impriſoned in the Tower and other places, on the charge of being Proteſtants. On the 10th of the ſame month Gardiner opened the firſt parliament in Mary's reign; and one of the early acts of this aſſembly was the paſſing a ſtatute for confirming the marriage of Catherine of Arragon, the queen's mother, with Henry VIII., in the preamble of which the divorce was pronounced impious and illegal, and the whole blame of it, againſt all truth and juſtice, attributed to archbiſhop Cranmer. He next cauſed a bill to be brought into the houſe of lords, which, after a debate of ſix days in the houſe of commons, was at length carried; by this, all the laws relating to religion made in king Edward's reign were repealed, and it was enacted at the ſame time that there ſhould be no other form of divine ſervice but what had been uſed in the laſt year of king Henry VIII. This was a prelude to the moſt ſevere and tyrannical meaſures: ſeveral Proteſtant prelates were deprived of their ſees; and their places were filled by Papiſts who had been excluded in the laſt reign. The commiſſion for the deprivation of the former was directed to Gardiner, Bonner, biſhop of London, and others. The Proteſtants who had the means, ſought for ſafety by withdrawing into foreign parts, and thoſe who were left behind began to feel the effects of the biſhop's vengeance. The priſons were crowded with victims, waiting with anxiety and terror the decrees of a bloody tribunal. In the mean time Gardiner was engaged in the management of a treaty of marriage between the queen and Philip, ſon of Charles V., king of Spain. This meaſure was extremely odious to the nation in general, and though the articles of the treaty were drawn with great art and plauſibility, and apparently much in favour of England, yet when they were publiſhed they gave no ſatisfaction to the people, who expected that if it took place, not only popery would be confirmed, but a Spaniſh government and inquiſition be eſtabliſhed, and, perhaps, England at length would be reduced to the degraded ſituation of a province to Spain. The general diſcontent on this ſubject gave riſe to the inſurrection headed by ſir Thomas Wyat. This was ſoon quelled, but the inſurgents were purſued with unabating fury, and the odium of the meaſures was caſt on Gardiner, which made him univerſally hated. On the ſame occaſion, the princeſs Elizabeth was ſent to the Tower, under the pretence of being concerned in Wyat's conſpiracy, but as he publicly acquitted her of this charge, and as nothing could be produced againſt her, ſhe was releaſed from her confinement. In 1554, Gardiner was enabled to conclude the treaty of the queen's marriage, and in July the queen met the Spaniſh prince at Wincheſter, where they were married by the biſhop. He now felt himſelf ſecure and determined to avenge himſelf on the Proteſtants in retaliation for what he had ſuffered from them during the preceding reign. Cardinal Pole was now admitted as the pope's legate in England, and ſoon after his arrival he declared to the parliament the object of his miſſion, and invited them to reconcile themſelves and the kingdom to the apoſtolic ſee. To this they readily agreed, and preſented a petition to their majeſties for the purpoſe, which, being ſignified to the legate in the royal preſence by Gardiner, the cardinal abſolved them, and received the people of England once more into the boſom of the catholic church. Almoſt immediately after this an act was paſſed, by which the authority of the Roman pontiff was re-eſtabliſhed, and a bill quickly followed it, by which the old ſtatutes againſt the heretics were revived in full force. From this period Gardiner gave full ſcope to his ſanguinary diſpoſition; he glutted himſelf with the blood of the Proteſtants, and was for ſome months perſonally concerned in the moſt ſavage acts of barbarity. Finding, however, that by his activity in the bloody work he had rendered himſelf ſufficiently odious, not only to Proteſtants, but to all the moderate perſons of his own party, he withdrew from taking an open part in it. He was now appointed with others to proceed to Calais, to a kind of congreſs which was held there for the purpoſe of mediating a peace between the emperor and the king of France. During this negociation, the pope died, and upon the elevation of his ſucceſſor, Gardiner took every precaution to ſecure to himſelf the dignity of cardinal, and the ſucceſſion to the ſee of Canterbury. In the month of October 1555, the biſhop opened the ſeſſions of Parliament, and in a ſhort time afterwards he was taken ill of a diſeaſe which terminated his life about the middle of November. The cauſe, and the exact time of this prelate's death, have been variouſly related. By ſome his laſt diſeaſe is ſaid to have been the gout; but by others it is regarded as a ſuppreſſion of urine, and ſome have imputed the immediate cauſe of his death to the effect of God's judgments on him for his cruelties exerciſed towards the biſhops Ridley and Latimer. By every hiſtorian he is repreſented as having ſuffered the moſt excruciating agonies on his death-bed, and to have felt the utmoſt remorſe in the recollection of his paſt miſdeeds. Frequently did he exclaim, with the utmoſt anguiſh of mind, "Erravi cum Petro, ſed non flevi cum Petro." But the errors of the apoſtle Peter were not to be compared, and ought not to be mentioned in connection with the foul deeds of the blood-thirſty Gardiner. The denial of his maſter in one caſe was probably the reſult of timidity only: the perſecutions of the biſhop of Wincheſter were the deliberate acts of a malignant heart, ſteeled againſt every ſentiment of charity, honour, and juſtice. The perſon of the biſhop perfectly correſponded with his mind, if the account given of it by his ſucceſſor Dr. Poynet can be relied on: "This doctor," ſays he, "hath a ſwarth colour, hanging look, frowning brows, eyes an inch within his head, a noſe hooked as a buzzard, noſtrils like a horſe, ever ſnuffing in the wind, a ſparrow mouth, &c." This was, probably, in ſome degree, a caricature repreſentation, dictated by perſonal hatred; nevertheleſs it is a portrait well adapted to a perſecutor. It has, however, been remarked, that with all the deformity

of his mind, he was occaſionally an encourager of learning, when the parties diſtinguiſhed by it were of the Catholic faith. He was the patron of ſome young men who became diſtinguiſhed public characters, and in two inſtances theſe were zealous Proteſtants as well as eminent for learning. The perſons referred to were ſir Thomas Smith, who had been ſecretary to Edward VI., and Roger Aſcham; with regard to theſe, his attention to the intereſts of learning triumphed over his ſyſtematic enmity to heretics: he permitted the former to live in a ſtate of privacy unmoleſted, granting him a penſion of 100*l. per ann.* and the latter he preferred to be Latin ſecretary to queen Mary. Gardiner himſelf was an author, but his pieces are of no great moment. Several of his letters to the duke of Somerſet, lord protector, and other perſons, are extant in the firſt edition of Fox's "Acts and Monuments," and ſome to Smith and Cheke, on the pronunciation of the Greek language in Bene't college library at Cambridge. The character given of this prelate by one of his biographers is, that "he was proud and arrogant, obſtinate and vain, of unbounded ambition, and maſter of the moſt profound diſſimulation. Though poſſeſſed of much natural courage and reſolution, as a courtier he was ſervile; and he ſcrupled not to violate his conſcience, when he had objects of intereſt or ambition in view. The part that he acted againſt the Papal ſupremacy in the reign of Henry VIII., and the conceſſions which he offered to make in the reign of Edward VI., compared with his ſubſequent conduct in the reign of Mary, afford abundant evidence of the truth of the preceding remarks. They alſo ſhew that he had no fixed principles of religion, and that his perſecuting ſpirit is to be attributed to falſe and narrow views of policy, and to a cruel malignant nature. When he pleaſed he could aſſume a winning addreſs, and diſplay no inconſiderable degree of eloquence, but when he was employed in trying heretics, as well as at other times, he would frequently deſcend to the loweſt abuſe, and the groſſeſt ſcurrility, and behave in a manner very unworthy of the character either of a gentleman or a ſcholar, and ſtill more thoſe of a Chriſtian and a biſhop." Biog. Brit. Burnet's Hiſt. of the Reform.

GARDINER, in *Geography*, a poſt-town of America, in Kennebeck county and ſtate of Maine, on the weſt bank of Kennebeck river.

GARDINER'S *Bay*, a large bay on the eaſtern extremity of Long iſland, on the coaſt of America. N. lat. 41° 3'. W. long. 72 15'.

GARDING, or GARDINGEN, a town of Denmark, in the duchy of Sleſwick; 28 miles W.S.W. of Sleſwick. N. lat. 54° 24'. E. long. 8° 52'.

GARDNER, a townſhip of America, in the county of Worceſter and ſtate of Maſſachuſetts, incorporated in 1785, and containing about 14,000 acres, well watered, chiefly by Otter river, and 667 inhabitants; 58 miles N.W. of Boſton.

GARDNER'S *Canal*, an inlet on the coaſt of New Hanover, extending about 40 miles from eaſt to weſt. N, lat. of the entrance 53° 35'. E. long. 231° 17'.

GARDNER'S *Iſland*. See AMARGURA.

GARDNER'S *Iſland*, or *Iſle of Wight*, an iſland of America, lying at the eaſt end of Long iſland, in the ſtate of New York, ſheltered within Oyſter pond and Montauk points; 10 miles N.W. of the latter, and as far S.W. of Plumb iſland. It contains about 3000 acres of fertile land, and yields excellent graſs, wheat, and corn. Fine ſheep and cattle are alſo raiſed upon it. It is annexed to E. Hampton, and is 40 miles S. weſtward of Newport, Rhode iſland.

GARDON, a river of France, which riſes in the department of the Lozére, traverſes that of Gard, receiving another river in its courſe, called "Gardon d'Alais," and runs into the Rhone, 4 miles N. of Taraſcon.

GARDONE, a town of Italy, on the Mela; 15 miles E. of Breſcia.—Alſo, a town of Hindooſtan, in Dowlatabad; 36 miles S. of Amednagur.

GARDOUCH, a town of France, in the department of the Upper Garonne; 15 miles S.E. of Toulouſe.

GARDSBY, a town of Sweden, in the province of Smaland; 28 miles N. of Wexio.

GARDSTRUM, a town of Sweden, in the province of Smaland; 7 miles N. of Calmar.

GARE, in our *Old Writers*, a coarſe wool, full of ſtaring hairs, ſuch as grow about the ſhanks of ſheep. 31 Edw. III. cap. 8.

GARED, in *Geography*, a town of Africa, in the kingdom of Suz, on the river Suz, famous for its Morocco leather.

GAREEA, a town of Bengal; 24 miles N.N.W. of Moorſhedabad.

GAR-EL-MAILAH, *i. e.* the *Cave of Salt*, a ſea-port of Africa, on the eaſt coaſt of Tunis; 4 miles W. of cape Zibeeb.

GARENCIERES, THEOPHILUS, in *Biography*, a phyſician of the faculty of Caen, was a native of Paris. He received his degree before the age of twenty, and came over to England, where he abjured the Roman Catholic religion, in which he was born. He was incorporated in the univerſity of Oxford on the 10th of March, 1657, and ſettled in London, where he was appointed phyſician to the French ambaſſador: but fortune was altogether adverſe to him, and he died overwhelmed with poverty and diſtreſs. He was, however, a man of ſome ſcience, as his works evince. They conſiſt of a treatiſe, in Engliſh, on the nature and properties of the tincture of coral, printed in 1676, in 12mo.; and another in Latin, entitled "Angliæ Flagellum, ſeu, Tabes Anglica numeris omnibus abſoluta," 1647, in 18mo. Eloy. Dict. Hiſt.

GARENGEOT, R. CROISSANT DE, an eminent French ſurgeon, was born at Vitre, a ſmall town in Brittany, on the 13th of July, 1688. His father practiſed ſurgery at that place, and ſuperintended his education, inſtructing him in the elements of his own profeſſion. In order to acquire a greater extent of practical knowledge, Garengeot ſpent five years in the hoſpital of Angers, and in the great naval hoſpitals of Brittany; and afterwards made two voyages in the navy. In 1711 he went to Paris, where, from the narrowneſs of his means, he lodged with a barber-ſurgeon, but ſtudied under Winſlow, Thibaut, Meri, &c. and alſo under the expert maſters of St. Côme, the moſt celebrated of the ſurgical ſchools. In 1725 he was admitted to the freedom of the corporation of St. Côme, through the favour of M. Mareſchal, then firſt ſurgeon to the king. Soon after this, he gave a courſe of lectures on anatomy in the medical ſchools; and henceforth his reputation extended even to foreign countries; for he was elected a member of the Royal Society of London. He was alſo appointed demonſtrator royal in the ſchools of medicine. On the eſtabliſhment of the Society of Academicians, under the patronage of the king, in 1731, Garengeot was choſen "Commiſſaire pour les extraits," which office he retained until the year 1742. He then ſucceeded Terryer in the place of ſurgeon-major of the king's regiment of infantry. He died at Cologne, in conſequence of an attack of apoplexy, on the 10th of December, 1759, at the age of 71.

The firſt of the works of Garengeot, entitled "Traité des Operations de Chirurgie," was publiſhed at Paris in

1720, and tranſlated into the Engliſh and German languages.—2. "Traité des Inſtrumens de Chirurgie," printed at Paris, and the Hague, 1723, and at Paris again in 1727, in two volumes, with plates.—3. "Myotomie humaine et canine, ou la manière de diſſéquer les Muſcles de l'homme et des chiens, ſuivie d'une Myologie ou Hiſtoire abrégée des Muſcles," Paris, 1724, 1728, 1750, two volumes, 12mo. The laſt of theſe editions is much more correct than the two former.—4. "Splanchnologie, ou, Traité d'Anatomie concernant les viſcères," Paris, 1728, 1729, in 12mo.; ibid, 1742, in two volumes, 12mo. A German edition was printed at Berlin, in 8vo. in 1733, which is ſaid to contain ſome valuable matter, but chiefly belonging to Winſlow and Morgagni. At the end of this work there is a diſſertation "Sur l'origine de la Chirurgie et de la Médicine, &c." in which Garengeot diſplayed an exceſſive pride and vanity, according to Portal; attempting to trace all the moſt brilliant diſcoveries in medicine to the ſurgeons; but forgetting the obligations which he himſelf owed to Du Verney, Winſlow, and Morgagni. For inſtance, he denied that Harvey was the diſcoverer of the circulation of the blood, which he attributed to Rueff, a Swiſs ſurgeon.—5. His laſt work was entitled "L'Operation de la Taille par l'appareil latéral corrigée de tous ſes defauts," Paris, 1730, in 12mo. Eloy. Dict. Hiſt.

GARET, in *Geography*, the moſt northern province of the empire of Morocco, on the weſtern banks of the Mulluvia, which divides Morocco from the province of Tremecen. This province, about 20 or 25 leagues in length, is bounded to the north by the Mediterranean, to the ſouth by mount Atlas, and to the weſt by the province of Rif.

GAREWDUN, a town of Thibet. N. lat. 33° 18'. E. long. 80° 50'.

GAREZZO, a town of France, in the department of the Stura, on the Tanaro; 9 miles S. of Ceva.

GARFETE, a town of Portugal, in the province of Alentejo; 12 miles W. of Crato.

GAR-FISH, in *Ichthyology*. See Esox *belone*.

GAR-FISH, *Great*. See Esox *oſſeus*.

GARGANEY, in *Ornithology*, a ſpecies of duck, the Anas querquedula of naturaliſts, diſtinguiſhed by having the ſpot on the wings green, and a white line over the eyes. Donov. Br. Birds.

This bird is ſeventeen inches in length, with varied plumage; the bill lead-colour; crown duſky with oblong ſtreaks; cheeks and neck purple with white ſtreaks; breaſt light brown with ſemicircular black bars; belly white; ſcapulars long, narrow, ſtriped with white, aſh-colour, and black; tail duſky, and legs lead-colour.

Female with an obſcure white mark over the eye; plumage browniſh-aſh; wings without green ſpot.

GARGANO, in *Geography*, a town of Naples, in the province of Capitanata; 7 miles N. of mount St. Angelo.—Alſo, a mountain of Naples, near the fore-mentioned town.

GARGANUS Mons, in *Ancient Geography*, *Mount St. Angelo*, a mountain of Italy, in Apulia, towards the north. One of its branches, projecting into the Ionian ſea, formed a promontory, called "Garganum promontorium."

GARGAPHIA, a fountain ſituated in Bœotia, near Platæa, the waters of which were poiſoned by Mardonius, in order to deſtroy the Greeks who were encamped in its vicinity; but the Platæans reſtored their original ſalubrity. Pauſan. in Bœot.—Alſo, a valley of Greece, in Bœotia.

GARGARA, a town of the Troade, near mount Ida. Strabo places it on one of the higher parts of this mountain, and ſays, that the promontory, on which Gargara was ſituated, was one of thoſe which formed the gulf of Adramyttium. Gargara is now a town of Aſiatic Turkey, in the gulf of Adramytti, in Natolia; 20 miles W. of Adramytti.

GARGARENSES, a people of Aſia, in Scythia, in the vicinity of the Amazons, at the foot of mount Caucaſus, on the northern ſide of it.

GARGARIDÆ, a people of India, attached to the worſhip of Bacchus, who inhabited the country near the Hypanis, and another river called Megarſas.

GARGARISM, Gargle, in *Medicine*, a liquid form of remedy, for diſorders in the mouth, gums, throat, &c.

The word is Greek, γαργαρισμα, formed of γαργαριζειν, *colluere*, to waſh, or the Hebrew *garghera*, the throat.

Gargariſms are compoſed of honey, ſalt, ſyrups, ſpirits, vinegar, waters, and decoctions; and produce their effects, by cleanſing, lubricating, &c. the parts.

Gargles are peculiarly uſeful in fevers and ſore throats; and they have this advantage above many other medicines, that they are eaſily procured and prepared: an uſeful gargle for ſoftening and cleaning the mouth may be made with a little barley water and honey, acidulated with vinegar. Gargles bear different appellations according to the uſes to which they are applied. An *attenuating* gargle, made by mixing ſix ounces of water, with one ounce of honey and a dram and a half of nitre, or by adding an ounce of honey and half an ounce of ſpirit of ſal ammoniac to the emollient gargle, may be uſed in the inflammatory quinſey or in fevers, for cleaning the tongue and fauces. A good gargle for this purpoſe may be made with ſtrong ſage tea, ſweetened with honey and ſharpened with vinegar. The *common* gargle, made by mixing ſix ounces of roſe-water with half an ounce of ſyrup of clove-July-flowers acidulated with ſpirit of vitriol, cleanſes the tongue and fauces, and ſerves alſo for a gentle repellent. The *detergent* gargle, prepared by mixing a pint of the emollient gargle with an ounce of tincture of myrrh and two ounces of honey, ſerves to cleanſe exulcerations and to promote the excretion of tough viſcid ſaliva. The *emollient* gargle, made by boiling an ounce of marſh mallow roots, and two or three figs, in a quart of water till near one half of it be conſumed, and ſtraining out the liquor, is beneficial in fevers, when the tongue and fauces are rough and parched, to ſoften theſe parts and promote the diſcharge of the ſaliva. Sir John Pringle recommends a decoction of figs in milk and water, with the addition of ſal ammoniac, as an uſeful gargle in the inflammatory quinſey, or ſtrangulation of the fauces.

GARGATHA Inlet, in *Geography*, a narrow channel between two ſmall iſlands, on the coaſt of Virginia. N. lat. 37° 44'. W. long. 75° 32'.

GARGAZA, in *Ancient Geography*, a town placed by Diodorus Siculus near the Palus-Mæotides. Ptolemy places it in Aſiatic Sarmatia.

GARGET, a diſeaſe of cattle, conſiſting in a ſwelling and inflammation of the head, affecting in particular the eyes and lips, and, at laſt, inflaming alſo the gums and tongue. This diſeaſe is ſometimes contagious. For the cure, the animal muſt be blooded every day, till the inflammation ſubſides Immediately after the firſt bleeding, give 2½ ounces of Epſom ſalts, diſſolved in a pint of warm ale; and then the following drink, given night and morning, has been recommended; take of warm ale half a pint, ſal prunellæ, or powdered nitre, half an ounce; Venice treacle, a quarter of an ounce, mixed and given in one doſe. The animal muſt be kept clean, dry, and quiet. If bliſters appear on

the tongue, they ſhould be broken, and dreſſed with ægyptiacum, or honey and vinegar. When the inflammation is likely to be very conſiderable, local bleeding is uſeful.

GARGIL, a diſtemper in geeſe, which by ſtopping the head frequently proves mortal. Three or four cloves of garlic, beaten in a mortar, with ſweet butter, and made into little balls, and given the creature faſting, are the ordinary cure.

GARGNAGO, in *Geography*, a town of Italy, in the department of the Benaco, on the left bank of the Garda lake; 21 miles N.E. of Breſcia.

GARGONZA, a town of Etruria; 14 miles S.W. of Arezzo.

GARHA, a river of Hindooſtan, which runs into the Chumbul, three miles N.E. of Suiſſopour, in Agimere.

GARHANA, in *Ichthyology*, a name by which ſome have called a large Braſilian fiſh, of the ſhape of our carp, more uſually known among authors by its Braſilian name *Acaraaya*.

GARIA, in *Geography*, a town of Perſia, in the province of Irak; 65 miles S.E. of Hamadan.

Garia *Bay*, a bay on the ſouth coaſt of Newfoundland; 22 miles E. of cape Ray.

GARIAN, a town of Africa; 37 miles S. of Tripoli.

GARICON, in the *Materia Medica*, a name given by the Arabian writers to the drug called agaric by the ancients.

The Arabians have ſaid nothing of this drug, but what they have tranſcribed from the Greek of Dioſcorides and others; it is certain, however, from the concurrent teſtimony of all the ancients, as to the form, nature, and virtues of agaric, that their's was not the ſame ſubſtance which we call by this name.

The ancients knew two kinds of what they call agaric; they diſtinguiſhed theſe by the common terms of male and female; the male was a root reſembling the ſilphium of a cubit long, and of an inch or two in diameter; the female was the corrupted wood of certain trees, particularly of the cedar, and other odoriferous woods.

Pliny makes it indeed the decayed wood of the oak, which ſhines like fire in the dark, and calls it the fungus, but this was not the agaric of the Greeks.

The female agaric, or the decayed wood of the cedar, was what they gave as an antidote and cordial: the male, or as others called it, the black agaric, was poiſonous. Dioſcorides places it among the poiſonous roots, and Avicenna condemns it, as hard and unfit for internal uſe; the other, or female agaric, being ſoft, friable, and tender. When it was thus in a great degree, however, it was condemned by the more accurate writers; and Dioſcorides, in particular, condemns the agarics of Cilicia and Galatia as too friable, and of no value: ſo that they ſeemed to fix upon a proper ſtage in the decay, as the neceſſary qualification of good agaric.

GARIDELLA, in *Botany*, ſo called by Tournefort, after his countryman Dr. Garidel, author of a folio hiſtory in French, with many plates, of the plants growing about Aix in Provence, diſpoſed alphabetically, and who claims the firſt diſcovery of the *Garidella* in France. Linn. Gen. 227. Schreb. 306. Willd. Sp. Pl. v. 2. 731. Sm. Prod. Fl. Græc. v. 1. 307. Mart. Mill. Dict. v. 2. Juſſ. 233. Tourn. t. 430. Lamarck Illuſtr. t. 379. Gærtn. t. 118. Claſs and order, *Decandria Trigynia*. Nat. Ord. *Multiſiliquæ*, Linn. *Ranunculaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of five ſmall, ovate, acute, deciduous leaves. *Cor.* Petals none, unleſs the calyx be taken for ſuch. Nectaries five, elongated, equal, with two lips; the outer one divided into two long, linear, obtuſe, flat ſegments; the inner ſhort and ſimple. *Stam.* Filaments moſtly ten, awl-ſhaped, ſhorter than the corolla; anthers erect, obtuſe. *Piſt.* Germens three, ovate, pointed, erect, connected; ſtyles ſcarcely any; ſtigmas ſimple. *Peric.* Capſules three, connected, oblong, pointed, compreſſed, of two valves; their inner future moſt convex. *Seeds* ſeveral, ſhort.

Eſſ. Ch. Calyx of five petal-like leaves. Nectaries five, two-lipped, cloven. Capſules three, connected. Seeds numerous.

Obſ. This genus is very nearly akin to *Nigella*, and what is calyx or petals in one, ought to be deemed ſo in the other. The other parts chiefly differ with regard to number, which in *Nigella* itſelf is irregular and variable.

1. G. *Nigellaſtrum*. Linn. Sp. Pl. 608. Curt. Mag. t. 1266. Figured in Garidel, t. 39. Native of fields in the ſouthern parts of Europe. The root is annual. *Stem* one or two feet high, erect, branched. *Leaves* chiefly in the lower part, finely bipinnatifid, reſembling fennel, but flat. *Flowers* ſolitary at the end of each branch, of a greyiſh hue ſpeckled with purple, and worthy of minute examination. *Fruit* granulated. It is eaſily cultivated like other hardy annuals, but has chiefly curioſity to recommend it.

Dr. Smith ſaw in M. Le Monnier's garden at Verſailles what was conſidered as a new ſpecies of this genus, but of this we have no further knowledge. See Tour on the Continent, ed. 2. v. 1. 75.

GARIGA, ſometimes written *Sariga*, in *Ancient Geography*, a town of Aſia, in Aria. Ptolemy.

GARIGLIANO, in *Geography*, a river of Naples, which runs into the gulf of Gæta, N. lat. 41° 15′. E. long. 13° 45′.

GARINDÆI, in *Ancient Geography*, a people of Arabia Felix, towards the lower part of the Arabic gulf.

GARINISH-Point, in *Geography*, a cape on the ſouth weſtern coaſt of Ireland, in the county of Cork, being near the ſouthern entrance of Kenmare river, and forming the S. weſtern point of Cuolagh bay. W. long. 9° 58′. N. lat. 51° 37′.

GARIOPONTUS, in *Biography*, a phyſician of the Salernian ſchool, who lived in the eleventh century, according to the teſtimony of Peter Damien, who died in 1072. He is called by various names by different writers; as Warimpotus, Raimpotus, Guaripotus, Garimpotus, &c. All that is known of him is, that he was the author of a work chiefly compiled from the obſervations of his predeceſſors, and eſpecially of Theodore Priſcian; but the ſtyle is extremely obſcure, in conſequence of the intermixture of Greek, Arabic, and Latin words. The following are its different editions and titles: "De morborum cauſis, accidentibus, et curationibus, libri viii." Lugd. 1516, in 4to. Baſil 1536, 8vo. "Paſſionarius Galeni de ægritudinibus à capite ad pedes," Lugd. 1526, 4to. "Ad totius corporis ægritudines remediorum praxecs, libri v." Baſil 1531, 4to. Eloy. Dict. Hiſt.

GARIS, in *Ancient Geography*, a town of Paleſtine, in Galilee, according to Joſephus.

GARISSOLES, Anthony, in *Biography*, was born at Montauban in the year 1587. Being intended for the profeſſion of theology, he received a ſuitable education, and made a rapid progreſs in all the elementary ſtudies to which his attention was directed. About the age of twenty-four he was admitted to the exerciſe of his miniſterial functions, and

and appointed paſtor of a church. In 1627 he was nominated to the office of profeſſor of divinity at Montauban, the duties of which he diſcharged with great diligence and fidelity till his death in 1650. He was moderator in the national ſynod held at Charenton in the year 1645. His numerous works are chiefly theological; but he was diſtinguiſhed alſo as a Latin poet. His principal poem was entitled "Adolphidos, ſive de bello Germanico, quod incomparabilis heros Guſtavus Adolphus et pro Germaniæ procerum et ſtatuum libertate geſſit." This was an epic poem, in twelve books, and is highly commended for its conſtruction and variety of images, noble ſentiments, and elegant Latinity. Gariſſoles wrote alſo a Latin poem on the coronation of Chriſtina, and another in praiſe of the four proteſtant Swiſs cantons. In teſtimony of their reſpect for his character, and their eſteem of his works, they ſent him in return four ſilver gilt cups, of exquiſite workmanſhip, accompanied with a Latin letter ſigned by the four ſyndics of the four cantons. Moreri.

GARITINA, in *Geography*, a town of European Turkey, in the Morea; 32 miles W. of Argos.

GARIVAN, a town of European Turkey, in Bulgaria, near the Danube; 22 miles S.W. of Driſtra.

GARIZZIM, in *Ancient Geography*, a mountain of Paleſtine, on which ſtood the Samaritan temple, oppoſite to which was mount Ebal, or Hebal; both of which were near the city of Schechem. Theſe two were parted only by a narrow valley of about 200 paces; the former being very fertile, and the latter very barren.

GARLAND, an ornament for the head, made in manner of a crown or chaplet.

The word is formed of the French *guirlande*, and that of the barbarous Latin *garlanda*, or Italian *ghirlanda*. Menage traces its origin from *gyrus*, through *gyrulus*, to *gyrulare*, *gyrlandum*, *ghirlandum*; and at length *ghirlanda*, and *guirlande*; ſo that *guirlande*, and *garland*, are deſcended, in the ſixth and ſeventh degree, from *gyrus*. Hicks rejects this derivation, and brings the word from *gardel handa*; which, in the northern languages, ſignify a *noſegay artfully wrought with the hand*.

Garlands are a ſort of chaplets, made of flowers, feathers, or even of precious ſtones, but eſpecially of flowers; to which the word, in our language, is more immediately appropriated. Janus paſſes in antiquity for the inventor of garlands. Athen. Deipnoſ. lib. xv.

GARLANDS alſo denote ornaments of flowers, fruits, and leaves intermixed; anciently much uſed at the gates of temples, where feaſts, or ſolemn rejoicings were held; or at any other places where marks of public joy and gaiety were deſired; as at triumphal arches, tournaments, &c. Garlands, or feſtoons, were alſo put on the heads of victims, in the ancient heathen ſacrifices. St. Paulinus, in his poem on St. Felix, does not forget the garlands, and crowns of flowers placed at the door of the church, and on the tomb of that ſaint.

The Italians have a ſort of artificers called *feſtaroli*; whoſe office is, to make garlands, or feſtoons, and other decorations for feaſts.

GARLAND, in *Mining*, ſignifies a ſpiral groove, made behind or in the ſtoning or ginging of a ſhaft, for collecting the water which oozes out of different ſtrata, to ſome upper level or ſough by which it can be diſcharged, or to a ciſtern from whence it can be pumped up, without deſcending to the bottom of the ſhaft. Sometimes garlands are conſtructed behind the ſtoning or bricking of a mine ſhaft from the top to the bottom, in order to render the ſhaft dry within-ſide, which is often a matter of ſufficient importance in preſerving the gin-ropes from decay, &c. to repay amply the care and expence of making ſuch garlands.

GARLAND alſo ſignifies a broad hoop of iron, or a ſquare frame of wood, which is uſed in coal-pits, to hold on the coals which are laſt heaped on the corves or gang-waggons, employed for conveying the coals from the bark or face of the work, to the bottom of the drawing-ſhaft, and up the ſame to the pit-hills or bank where they are landed, for ſale, or to be put into gang-waggons or trams above ground, to be conveyed to ſome wharf or great town, &c.

GARLAND, in a *Ship*, denotes a collar of ropes, wound about the head of the main-maſt, to keep the ſhrouds from galling.

GARLAND is alſo a ſort of net, whoſe opening is extended by a wooden hoop of ſufficient ſize to admit a bowl or platter within it. It is uſed by the ſailors as a locker or cupboard to contain their proviſions, being hung up to the deck, within the birth, where they commonly meſs between decks.

GARLAND, *Shot*, is a piece of timber nailed horizontally along the ſhip's ſide from one gun-port to another, and uſed to contain the round ſhot ready for charging the great guns in battle. For this purpoſe it is furniſhed with ſeveral ſemi-globular cavities, correſponding to the ſize of the cannon balls contained in it.

GARLICK, in *Botany*, &c. See ALLIUM.

GARLIC, *Wild*, a name given to a ſpecies of onion.

GARLICK, *Pear*. See CRATEVA.

GARLIESTON, in *Geography*, a ſea-port town of Scotland, in the county of Wigton, ſituated in a cave of Wigton bay, called "Garlieſton bay." It is of modern date, pleaſantly built in the form of a creſcent, and eſteemed an excellent fiſhing ſtation, with ſafe anchorage; ſix miles S. of Wigton. N. lat. 54° 50'. W. long. 4° 25'.

GARLIN, a town of France, in the department of the Lower Pyrenées, and chief place of a canton in the diſtrict of Pau; 16 miles N. of Pau. The place contains 1000, and the canton 7616 inhabitants, on a territory of 172½ kiliometres, in 29 communes.

GARMOUTH, or GARMACH, a burgh of barony in the ſhire of Murray, Scotland, ſtands near the mouth of the river Spey, which here forms a harbour. In this many veſſels are built from the timber out of the contiguous foreſts of Strathſpey and Badenoch. Beſides the ſhipping, and timber trade, Garmouth employs ſeveral ſloops in conveying ſalmon to the London market. The town conſiſts of 304 houſes, and contains about 1200 inhabitants. Moſt of the buildings are conſtructed of clay.

GARN, a town of Sweden, in the province of Upland; 12 miles N.E. of Upſal.

GARNACE, in *Ancient Geography*, a town of Leſſer Armenia, in the diſtrict of Muriana. Ptolemy.

GARNENBERG, a town of Sweden, in Dalecarlia; 5 miles N.E. of Hedemora.

GARNER, a river of England, which joins the Garran, and runs with it into the Wye, 4 miles S.W. of Roſs in Herefordſhire.

GARNER, in *Rural Economy*, a term employed to ſignify, in ſome places, a granary, or repoſitory for corn. It is likewiſe applied to a corn-binn.

GARNET, THOMAS, in *Biography*, was born at Caſterton, near Kirkby-Lonſdale, Weſtmoreland, on the 21ſt of April, 1766. He received his grammar-ſchool education at a village in the neighbourhood, and was, at the age of fifteen, put apprentice to the celebrated mathematician, Mr. Dawſon of Sedbergh, who was at that time a ſurgeon and apothecary. In the year 1785 he commenced his ſtudies at

at Edinburgh, where he took the degree of M.D. in 1788. He thence repaired to London, and purſued his profeſſional ſtudies with great zeal in the chief hoſpitals. He ſettled as a phyſician at Bradford in Yorkſhire in 1790, and began to give private lectures on philoſophy and chemiſtry. Here he wrote his treatiſe on the Horley Green Spa. Bradford did not afford ſufficient ſcope for his practice, and in 1791 he removed to Knareſbrough, ſpending the ſummer at Harrowgate, and the winter at that place: and in 1791 and 92 he publiſhed an analyſis of the different waters of Harrowgate. Whilſt at Harrowgate his reputation greatly increaſed, and he reſolved to leave his reſidence for a field ſtill more calculated to forward his views; and with this opinion he determined to ſail for America. While waiting to take his paſſage at Liverpool, however, he was ſolicited to unpack his apparatus, and to deliver a courſe of lectures there; with which he complied, and gave great and general ſatisfaction, and his fame ſpread around, inſomuch that he was afterwards induced to repeat his courſe at Mancheſter, Warrington, and Lancaſter. He was alſo invited to lecture at Birmingham and Dublin, when he was informed of the vacancy at Anderſon's Inſtitution at Glaſgow, the profeſſorſhip of which was handſomely offered to him, and he began his lectures there in Nov. 1796. In 1798 he began his tour to the Highlands, an account of which he publiſhed in 1800. At the formation of the Royal Inſtitution in London, Dr. Garnet was invited by count Rumford to become the lecturer; he accepted the appointment, and the lecture-room was crowded with perſons of the firſt diſtinction and faſhion. From the time of his arrival in London, however, he turned his thoughts to the practice of his profeſſion, as likely to afford the moſt permanent means of ſupport; but his plans and proſpects were all terminated by death on the 28th of June, 1802. A poſthumous volume, entitled "Zoonomia," was publiſhed for the benefit of his orphan family. See the preface to that work.

GARNET, in *Mineralogy*, a ſpecies conſidered as ſubordinate to the ſiliceous genus of foſſils. The ſubſtances that compoſe it exhibit a remarkable ſimilarity of external form, united, however, to great diſparity in colour, and particularly in the nature and proportion of their component parts. Hence ſeveral attempts have been made at ſubdividing this aſſemblage, and ſome lately diſcovered ſubſtances, obviouſly belonging to the garnet, have been introduced under new names, and as diſtinct ſpecies. Haüy, conformably to the principles of his ſyſtem, has conſolidated under the ſpecific name of *grenat*, the various ſubſtances deſcribed as precious and common garnet, almandine, pyrope, colophonite, topazolete, ſuccinite, and melanite. Werner's diviſion of this ſpecies into the two ſub-ſpecies of *noble* and *common* garnet, though it may not draw a perfect line of demarcation between the two ſubſtances, is ſtill of practical utility, and partly founded on chemical and geological obſervation. We ſhall adopt the ſame diviſion, but add likewiſe, as ſub-ſpecies, the pyrope and melanite, both of which, from geognoſtic conſiderations, are introduced as diſtinct ſpecies into the Wernerian ſyſtem. The uniting into one maſs extenſive ſuites of ſubſtances of various appearance and compoſition, merely becauſe we diſcover the ſame type of cryſtallization in them, is often productive of great inconvenience to the ſtudent; and the ſame may be ſaid of the oppoſite practice of founding ſpecific diſtinctions on characters not ſufficiently important. With regard to the garnet, it is for repeated chemical analyſis to aſſiſt in determining what rank the ſubſtances enumerated under the following ſub-ſpecies may hereafter occupy in the ſyſtem. The chemical diſtinction afforded by the preſence of a greater proportion of lime in the common garnet and the magneſia as a conſtituent part of the pyrope-garnet, though it may aſſiſt in, is ſtill much too vague entirely to regulate, the diſtribution of the granatine ſubſtances.

Sub-ſpecies—1. *Noble Garnet.*—*Almandine*, Karſten. *Oriental garnet.*—*Grenate oriental, ſurian, ſirien, &c.* Colour cherry and blood-red, of various intenſity, paſſing on one ſide into dark crimſon and columbine red, in which the blue often conſiderably predominates; and on the other into hyacinth-red and reddiſh yellow.

It is ſometimes found maſſive and diſſeminated, but generally cryſtallized. The principal modifications of the cryſtals are,

1. The rhomboidal dodecahedron, alſo denominated the garnet-dodecahedron, and which is at the ſame time the primitive form. It is ſometimes found elongated in ſuch a manner that ſix of its planes, taking the form of oblique-angled parallelograms, conſtitute the lateral planes of a ſix-ſided priſm, while three planes at each end preſerving their rhomboidal form, may be conſidered as acuminating planes ſet on the alternate lateral edges of the priſm. (Grenat primitif alongé, Haüy.)

2. The primitive cryſtal having each edge intercepted by a ſingle plane. This modification has 36 planes, 12 of which are rhombs, and 24 hexagons. (Grenat emarginé, Haüy, pl. 46. fig. 57.) It forms the tranſition into

3. The leucite cryſtallization, or roundiſh cryſtal with twenty-four equal, trapezoidal planes; which is deſcribed alſo as a low, double, eight-ſided pyramid, with the lateral planes of the one ſet on the lateral planes of the other, and having each ſummit acuminated by four planes ſet on the alternate lateral edges. (Grenat trapezoidal, Haüy, pl. 46. fig. 56.)

What is deſcribed as leucite cryſtal, in which the angles formed by the meeting of the different trapezoidal planes are truncated, is a variety of modif. N° 2. in which the rhombs are much ſmaller than the hexagons.

4. The garnet dodecahedron having each of its edges intercepted by three planes, or modif. N° 2, increaſed by 48 planes between the rhombs and hexagons, (Grenat trié-marginé, Haüy, pl. 46. fig. 58.)

5. Modific. N° 2, augmented by 24 planes; all the edges formed by the meeting of four hexagons being intercepted each by a narrow plane. (Grenat uniternaire, Haüy, pl. 46. fig. 59.)

Theſe modifications do not excluſively belong to the noble garnet; they all occur, though more rarely, in the common garnet, and at leaſt, N°' 1 and 2, in the melanite garnet.

The cryſtals are found of all ſizes, from that of the head of a ſmall pin to that of a clenched fiſt, and upwards; the latter belonging always to this ſub-ſpecies, and generally to Mod. N° 1. and its elongated variety. They are found imbedded or looſe, not in druſes. Their ſurface is generally ſmooth, but not ſeldom furniſhed with ſtriæ or furrows indicative of the decrement of the laminæ on the rhomboidal primitive planes.

While the external luſtre of the cryſtals and grains varies according to circumſtances, that of the interior is conſtantly more or leſs ſplendent; it is between vitreous and reſinous.

Its fracture is generally perfectly conchoidal, approaching ſometimes to uneven and ſplintery; and in ſome caſes it has been obſerved to border on foliated. Fragments indeterminately angular, more or leſs ſharp-edged; but the maſſive noble garnet, eſpecially that from Norway, is generally compoſed of fine or coarſe-grained concretions, producing, in the

the tranſparent varieties, the appearance of innumerable flaws.

Its tranſparency varies from perfectly tranſparent to tranſlucent at the edges only; and a ſlight degree of cloudineſs is obſerved even in the pureſt.

It is harder than quartz, and its hardneſs appears to be in a ratio with its purity and tranſparency.

It is brittle, and eaſily frangible.

Specific gravity greater or leſs according to the varying proportion of iron it contains: 4.352, Karſten.—4.230, Werner.—4.135, Gellert.—4.085, Klaproth.—4.188, Briſſon.—3.889 (that of Greenland), Lichtenberg.

The chemical characters of the noble garnet are not eaſily ſeized. It is fuſible before the blow-pipe, but requires a high degree and long continuance of heat. In the charcoal crucible it melts into a grey turbid glaſs; and 100 grains, thus fuſed, without any addition, yielded to Klaproth a globule of iron of 23 grains.

We poſſeſs the following analyſes of the noble garnet.

Klaproth.

Silica	35·75
Alumina	27.25
Oxyd of iron	36.0
Oxyd of manganeſe	0.25
Loſs	0.75
	100

Vauquelin, according to Haüy, found 102 parts of what he terms the trapezoidal red garnet of Bohemia to contain, ſilica 36, alumine 22, lime 3, oxyd of iron 41; and the compoſition of ſmall dodecahedral red garnet cryſtals, from Eres-lids, near Barège, the ſame diſtinguiſhed chemiſt ſtates to be ſilica 52, alumine 20, oxyd of iron 17, lime 7·7, loſs 3.3.

The liſt of the localities of the noble garnet, as it is given in the ſyſtems of Mineralogy, is not to be depended upon; moſt of the writers confounding this with ſome varieties of the other ſub-ſpecies: nor is it of any avail barely to know that a mineral is found in Pegu, Ceylon, &c. if we remain ignorant reſpecting the mode in which it occurs there. The lapidaries have much contributed in this reſpect to lead the mineralogiſt into error. Their cuſtom of dignifying by the term of "oriental" every ſtone they conſider of ſuperior quality, is too well known to miſlead; and we ſuſpect that the epithet *Surian* or *Syrian*, given to the noble garnet (but which is probably derived from *Soranus*, a name applied in the middle ages to ſome red ſtone or other), has firſt cauſed Syria, and afterwards Pegu (a town of which is called Sirian) to be introduced into the liſt of the localities of this ſtone. Of the places in Europe where the noble garnet is found, the following may be mentioned: Norway; Sweden (Fahlun, Grapenberg); Greenland; Scotland (Aberdeenſhire, Roſsſhire, and the Long iſland); Siberia; Saxony (Zöblitz, Galenz); Sileſia (Querbach, &c.); Bohemia; Tyrol (Zillerthal, &c.); Stiria (Stubner Alps, &c.); Switzerland; France, &c.

This ſub-ſpecies is a production of the primitive mountains: it is found in mica ſlate, chlorite ſlate, in hornblende and ſerpentine. In gneiſs and granite it occurs but ſeldom. It is never found as the production of any particular mineral repoſitory, ſuch as veins or beds.

The noble garnet is poliſhed and cut like the more valuable precious ſtones, and uſed for ornamental purpoſes. There are alſo ſome engravings to be ſeen in it, both modern and ancient. Of the latter we mention *inſtar omnium*, the Dog-Sirius, by ΓΑΙΟC, the greateſt maſter-piece exiſting in point of deep work and finiſh, which is in the collection of the duke of Marlborough, and is ſaid to be in garnet.

Obſervations.—1. The noble garnet from Greenland, conſiſting of curved lamellar concretions, has been hitherto found only maſſive, in rolled and indeterminately angular pieces.

2. Champeaux deſcribes amorphous and rounded pieces of noble garnet, of the ſize of a pigeon's egg, forming tubercles in a white indurated talc found in the mountains of Courſon, above Traſcuaire, in the Simplon.

3. Noble garnets and pyrope garnets, that have, by decompoſition, loſt their natural colour and become friable, are ſometimes improperly called *unripe garnets*.

4. The primitive form of the garnet is exactly the ſame as that of the cells of bees: the polyhedron exhibited by theſe two bodies is that which offers moſt capacity with the leaſt ſurface. Haüy.

Sub-ſpecies 2.—Pyrope Garnet; Pyrope, Werner; *Bohemian garnet.* It has not yet been found cryſtallized, but only in ſmall and middle-ſized angular and rounded pieces. Its colour is intenſely blood-red, appearing blackiſh red in the larger pieces. Internally its luſtre is ſtrong: it is ſplendent and vitreous. Its fracture is conchoidal, more perfectly ſo than that of the noble garnet: it is completely tranſparent. Hardneſs and ſpecific gravity between thoſe of the common and noble garnet: ſp. gr. 3.941, Werner; 3.718, Klaproth.

Its chemical character is nearly that of the noble garnet; from which it differs, however, according to Klaproth's analyſis, in having magneſia for one of its component parts

Silica	40.00
Alumina	28.50
Magneſia	10.00
Lime	3.50
Oxyd of iron	16.50
Oxyd of magneſia	0.25
Loſs	1.25
	100

Klaproth's Beitr. vol. ii.

The pyrope is almoſt entirely confined to the fletz-trap formation. In the Bohemian middle-mountains (at Meronitz, Podſedlitz, Chraſtian, Terzeblitz, &c.) it is found partly immediately below the upper mould, partly in a greeniſh-grey kind of wacke, and among baſaltic boulders and *contritus* of the ſame, lying immediately under a ſtratum of marle. At Ely in Fifeſhire, Scotland, it is, according to Jameſon, found in the ſand on the ſea-ſhore, and is probably derived from the neighbouring fletz-trap rocks. At Zoblitz, in Saxony, it is ſaid to occur in ſerpentine.

The pyrope or Bohemian garnet of the lapidaries, is next in value to that variety of the noble garnet called oriental or Sirien garnet, and is, like it, cut for ring-ſtones, necklaces, bracelets, &c. It is often a matter of difficulty to diſtinguiſh this ſub-ſpecies from the preceding, when cut; and, indeed, in whatever manner mineralogiſts may diſpoſe of the pyrope in their ſyſtems, the lapidaries can ſcarcely be expected to ſeparate it from the other precious garnet.

In Bohemia, the pyrope and noble garnets conſtitute an article of commerce of the greater importance, as they procure a livelihood to an extenſive claſs of people, who have no other means of ſubſiſting than the digging for and manufacturing this article of luxury. A principal place for theſe garnets is Meronitz, at the Stifleberg; but in ſtill greater abundance they are found at Podſedlitz, Drſkowitz, and Trzeblitz, villages in the circle of Leutmeritz, to the weſt

of the road that leads from Dreſden to Prague. At Meronitz they are dug up without further preparation; but at the laſt-mentioned places a regular ſyſtem of mining is adopted for obtaining them. The firſt proceſs conſiſts in removing the upper ſtratum of mould; after which a ſhaft is ſunk through the marle, where the boulders and the contritus of baſalt appear, the latter of which, being in the form of coarſe blackiſh gravel, is ſent up in baſkets and kept for uſe. Levels or drifts are then excavated, running in ſeveral directions from the bottom of the ſhaft, and, after having yielded their contents, are again filled up with the boulders and rubbiſh.

The next proceſs is that of ſeparating the pyrope garnets from the heterogeneous matter by which they are enveloped; to effect which the baſaltic gravel is put into veſſels filled with water, and ſtirred for a conſiderable length of time; after which the lighter particles are poured off with the water. This proceſs is repeated ſeveral times, till nothing remains at the bottom of the veſſel but the heavier pieces of rubbiſh with the garnets among them, which latter are carefully picked out by women.

The garnets are next paſſed through veſſels pierced with holes of various diameter, by which means they are ſorted into ſix different ſizes: of the largeſt about 32 go to an ounce; the next are thoſe of about 40, 75, 110, 165, 265, and 400 to an ounce of Nuremberg weight; while thoſe ſtill leſs in ſize are ſold partly to the apothecaries, who uſe them for regulating their ſcales; partly to the richer poſſeſſors of gardens, for ornamenting the walks. Pieces of which 16, 20, or 24 go to the ounce, are rarely ſeen; though there are a few inſtances of pieces having been found of as much as one-fifth of an ounce in weight.

The art of cutting and boring theſe garnets occupies a great number of men. The latter of theſe operations is performed in the following manner: The garnet is properly placed and faſtened, after which the diamond, which is fitted up like a glazier's diamond, is placed on the top and rapidly turned by means of a bow. A workman can bore 150 a day.

The larger of the pyrope garnets are cut and poliſhed, which is performed with emeril on a diſk cut out of ſand ſtone. A workman generally finiſhes thirty in a day. This art, which is of very long ſtanding in Bohemia, eſpecially at Carlſbad and Turnau, has been carried to the higheſt perfection at Freiburg and Waldkirch, two towns in Suabia, the latter of which has no leſs than twenty-four mills, and 140 maſters occupied in the manufacturing of this article of commerce.

Sub-ſpecies 3.—*Common Garnet*; *Silex Granatus vulgaris*; *Roche de Grenat*, *&c.*—Its colour is chiefly green and brown of various ſhades; the former occurs as olive, leek, mountain, piſtachio, and graſs green, and alſo paſſes into greeniſh-grey; while the latter, as liver, reddiſh, and yellowiſh-brown, paſſes into browniſh and hyacinth red, and rarely into orange and iſabel, or cream yellow. Both the brown and green varieties appear ſometimes nearly black.

It generally occurs maſſive and diſſeminated, ſeldom as imbedded grains, but frequently cryſtallized. The cryſtals aſſume all the forms belonging to the noble garnet; but they are almoſt conſtantly aggregated and formed into druſes. They ſeldom ſurpaſs the middle ſize, but are uſually ſmall.

Internally the common garnet is more or leſs gliſtening; luſtre between reſinous and vitreous.

Fracture uneven, coarſe, and ſmall-grained, ſometimes approaching to ſplintery, and alſo to ſmall conchoidal. Fragments indeterminately angular, not particularly ſharp edged. When maſſive it often appears to conſiſt of coarſe or fine-grained concretions, of various degrees of coheſion, ſometimes perfectly friable.

It is ſeldom ſemi-tranſparent, generally more or leſs tranſlucent, often only at the edges, ſometimes completely opaque. Hardneſs inferior to that of the noble and pyrope-garnet; it is brittle and eaſily frangible.

Specific gravity 3.737 (green var. from the Bannat) Werner; 3.754 (green, from the Teufelſtein near Schwarzenberg) id.; 3.668 (green var. from Sweden) Karſten.

The common garnet yields much ſooner to the fire than the noble. Before the blow-pipe it loſes its colour and melts without difficulty. The green, before it melts, generally turns grey.

Conſtituent parts.—The green garnet from the Ehrenberg at Ilmenau contains, according to

	Wiegleb	and Merz,
Silica	26.46	40
Alumine	22.70	20
Lime	17.91	8
Iron	16.25	20
Loſs	16.68	12
	100	100

Voigt's Min. u. Bergm. Abh. vol. i.

The conſiderable deficit in both theſe analyſes is remarkable.

The reſult of Klaproth's analyſis of the olive-green garnet, from the river Wilui, in Siberia, is

Silica	44
Lime	33.50
Alumine	8.50
Oxyd of iron	12
—— of manganeſe (a trace only).	
Loſs	2
	100

Klapr. Beitr. vol. iv.

The pitch garnet of Karſten, deſcribed by ſome mineralogiſts under the name of *Colophonite*, but which is nothing but common garnet of a yellowiſh-brown colour, generally occurring in diſtinct granular concretions, conſiſts, according to M. Simon, of

Silica	35
Alumine	15
Lime	29
Magneſia	6.5
Iron	7.5
Manganeſe	4.75
Oxyd of Titane	0.5
Water	1
Loſs	0.75

Bulletin des Sc. Apr. 1808.

From the Daniſh Naturh. Selſkap Skrifter, vol. ii. n. 2. it appears that Prof. Becker found 200 grains of the green garnet from Norway to conſiſt of ſilex 78, iron 64½, alumine 14, lime 42; the loſs being 1½.

Wiegleb, an accurate chemiſt, who examined the green common garnet, from the Teufelſtein in Saxony, could not diſcover a veſtige of alumine in that variety.

Its principal localities are Saxony, (Schwarzenberg, Ehrenfriederſdorf, Berggieſhübel, Schneeberg, Geier, &c.); Sileſia; Bohemia (in ſeveral parts); Hungary (Dognatzka,

Orawitza, Wadarna, Saſka, Dobſchau); Saltzburg (Zillerthal, Thal-Achen, mountains of Brennthal, &c.); Tyrol (Schwatz); Norway (var. called Colophonite, and others); Sweden (Garpenberg, Fahlun, Dannemora); Siberia; Ireland; Kamtſchatka (fine bright green variety.)

The geognoſtic ſituation of the common garnet is that in beds, in the older primitive rocks, where it occurs partly maſſive, partly cryſtallized in druſes; and it is (contrary to what we know of the noble garnet) but ſeldom ſeen diſſeminated in, or mixed with, other rocks. Sometimes it forms entire beds by itſelf, for inſtance in the Saxon and Bohemian Ertzgebirge, &c. It accompanies various ores, ſuch as copper and iron pyrites, magnetic and red iron ſtone, galena, blende, &c. It occurs with epidote, with ſahlite, and other varieties of pyroxene, in the iron mines of Norway; with table-ſpar, tremolite, calcareous ſpar, &c. at Dognatzka, and in other places of the Bannat.

The uſes to which the common garnet is applied are by no means various. In ſome countries where the green variety is found in abundance, it is, on account of its eaſy fuſibility, and of the conſiderable portion of iron that enters into its compoſition, advantageouſly employed as a flux in the ſmelting of iron ores.

Obſervations.—1. The brown variety often reſembles tin ſtone, and is by ſome called tin garnet; whence, probably, the miſtaken notion ſo often repeated by authors, that tin enters into the compoſition of ſome garnets.

2. The *Hyacinthe la belle*, conſidered by ſome as a variety of the common garnet, is (if we have the right ſpecimen before us) the lighteſt reddiſh-yellow variety of the noble garnet.

Subſpecies 4.—*Melanite Garnet; Black Garnet.*—Colour deep or velvet-black when freſh; worn off it becomes greyiſh-black.

It occurs cryſtallized; cryſtals thoſe of N° 1, and particularly of N° 2, of the noble garnet; they are middle-ſized and ſmall. The rounded pieces are the ſame, only diſturbed in their developement. Externally they are more or leſs ſmooth and ſhining; internally gliſtening.

Fracture imperfectly ſmall conchoidal. Fragments indeterminately angular, ſharp-edged.

It is perfectly opaque, not particularly hard, but very brittle. Specific gravity 3.800, Werner; 3.691, Karſten.

Conſtituent parts, according to Klaproth's analyſis,

Silica	35.5
Alumine	6
Lime	32.5
Oxyd of iron	25.25
Oxyd of manganeſe	0.4
Loſs	0.35
	100

Bullet. des Sc. 1808.

The melanite has been found at Fraſcati near mount Veſuvius, imbedded, as it is ſaid, in a baſaltic maſs, which alſo includes feldſpath, Veſuvian, and hornblende; the looſe cryſtals are generally picked up in the fields of the ſame neighbourhood, as alſo about Rome. Near mount Somma it occurs imbedded in a calcareous rock, according to Breiſlak. It is likewiſe found in Bohemia in the Brenzlau-circle, and near Teplitz; for, from the deſcription given by Reuſs (in Sammlung Nat. Hiſt. Aufsätze, p. 307), the two foſſils occurring there in baſalt, the one accompanied by hornblende and augite, the other by common olivine, mica, and calcareous ſpar, appear to agree in all the eſſential characters with the Italian melanite.

Whether the black garnet of Eres-lids, analyſed by Vauquelin, belong to this ſub-ſpecies, remains ſtill to be determined. It conſiſts of ſilica 43, alumine 16, lime 20, oxyd of iron 16, and water 4.

The mineral ſubſtance from Arendal in Norway, deſcribed by Mr. Ingverſen as melanite, is, by Mr. Emmerling, ſuſpected to be nothing but augite (Pyroxène, Haüy.)

GARNET, in a *Ship*, is a tackle having a pendant coming from the head of the main-maſt, with a block ſtrongly ſeized to the main-ſtay, juſt over the hatch-way; in which block is reeved the runner, which hath a block at one end, in which are hitched the ſlings; and at the other end is a double block, in which the fall of the runner is reeved; ſo that by its means any goods, or caſks, that are not over heavy, may be haled and hoiſed into, or out of the ſhip: when this garnet is not uſed, it is faſtened along by the ſtay at the bottom of it.

GARNET, *Clew.* See CLEW-*garnet*.

GARNIER, ROBERT, in *Biography*, was born in 1545 at La Fertè Bernard, in Maine. He was educated for the profeſſion of the law, and attained to conſiderable rank in that line, but in his advanced years Henry IV. created him a counſellor in his grand council. He died at Mans in the year 1601. He was attached to poetry in his youth, and while ſtudying at Toulouſe obtained a prize in the Floral games of that city. He was afterwards known as a writer of tragedies, and is conſidered as one of the creators of the French theatre. Moreri.

GARNISH, in ſome ancient writings and ſtatutes. To garniſh the heir ſignifies to warn the heir. 27 Eliz. cap. 3.

GARNISHEE, in *Law*, the party in whoſe hands money is attached within the liberties of the cities of London; ſo called in the ſheriff's court, becauſe he has had garniſhment, or warning, not to pay the money, but to appear and anſwer to the plaintiff-creditor's ſuit.

GARNISHING is popularly uſed for the furniture, aſſemblage, or fortment, neceſſary for the uſing or adorning any thing.

The word is French, formed of the verb *garner*, to furniſh, or fit out.

The garniſhing of a diſh conſiſts of certain things which accompany it, either as a part and ingredient thereof; in which ſenſe pickles, muſhrooms, oyſters, &c. are garniſhing: or as a circumſtance, or ornament; as when leaves, flowers, roots, &c. are laid about a ſervice to amuſe the eye.

The ſame word is uſed for the finer herbs, fruits, &c. laid about a ſallad: garniſhings are of lemon, piſtachios, pomegranate, yolks of hard eggs, artichoke-bottoms, capers, truffles, ſweet-bread, &c.

GARNISHMENT, in *Law*, denotes a warning given any one to appear, for the better furniſhing of the cauſe, and court. Thus, if one be ſued for the detinue of certain charters; and ſays, they were delivered to him, not only by the plaintiff, but by J. S. alſo; and therefore prays, that J. S. may be warned to plead with the plaintiff, whether the conditions are performed or not. In this petition he is ſaid to pray garniſhment; which may be interpreted, a warning to J. S. to provide himſelf for a defence; or elſe a furniſhing the court with all parties to the action, whereby it may thoroughly determine the cauſe.

GARONNE, in *Geography*, a river of France, which riſes in the Pyrenées, and joining with the Dordogne, about 12 miles below Bourdeaux, changes its name to Gironde.

GARONNE,

GARONNE, *Upper*, one of the departments of France, in the S.W. or Garonne region, formerly Upper Languedoc, in 43° 20′ N. lat. is bounded on the N. by the department of the Lot, on the N.E. by the department of the Tarn, on the S.E. by the departments of the Aude and the Arriege, on the S. by Spain, and on the W. by the departments of the Upper Pyrenées and the Gers. It takes its name from the river Garonne, which paſſes through it. Its capital is Toulouſe. Its extent is 8,077½ kiliometres, or 408 ſquare leagues, and it contains 432,263 inhabitants, in five diſtricts *viz.*: Caſtel-Sarrazin, including 66,397 inhabitants, on 1,220 kiliometres, and 86 communes; Toulouſe, having 126,140 inhabitants, on 1,695 kiliometres, and 142 communes; Villefranche, containing 53,356 inhabitants, 955 kiliometres, and 99 communes; Muret, including 78,905 inhabitants, 1,800 kiliometres, and 130 communes, and St. Gaudens, having 107,465 inhabitants, 2,407½ kiliometres, and 234 communes. Its contributions amount to 4,554,341 francs, and the expences charged upon it for adminiſtration, juſtice, and public inſtruction, amount to 432,316 fr. 66 cent. This department, lying between Lot and the frontier of Spain, conſiſts of hills, and tolerably fertile plains; producing grain, fruits, wine of an indifferent quality, paſtures, and conſiderable foreſts, with quarries of marble, and mineral ſprings.

GARONNE and *Lot*. See LOT and *Garonne*.

GAROSMUS, in *Botany*, from γαρον, *garum*, the liquor of pickled fiſh, and οσμη, *a ſmell*. Dodoen. Pempt. 616. A name very well applied by Valerius Cordus to the *Chenopodium olidum*, Fl. Brit. 277. Engl. Bot. t. 1034, whoſe intolerable fetor, when the plant is touched, reſembles corrupted ſalt-fiſh. Lobel relates a ſtory of its being peculiarly attractive to dogs.

GAROUAI, or GAROVAY, in *Geography*, a town of Africa, on the Grain coaſt, on the river St. Clement.

GARRA, LANA, or *Neratte*, in *Ancient Geography*, a town of Mauritania Cæſarienſis, mentioned by Ptolemy; it was ſituated towards the N.E. of Victoria, and had been epiſcopal.

GARRACHICA, in *Geography*, a town of the iſland of Teneriffe, which had formerly been a ſea-port; but the harbour being deſtroyed by an earthquake and eruption of the volcano on the peak in 1704, the houſes are now built where the ſhips lay at anchor.

GARRACOURY, a town of Hindooſtan, in Marawar; 20 miles S.S.E. of Trumian.

GARRAF, town of Spain, in Catalonia, near the ſea-coaſt; 10 miles S.W. of Barcelona.

GARRAN, a river of England. See GARNER.

GARRARD, a county of Kentucky, in America, S.E. of Madiſon county, on the ſouth ſide of Kentucky river.

GARRAWAY, a town of Africa, on the Slave coaſt. N. lat. 4° 10′. W. long. 8°.

GARREFIO, a town of France, in the department of the Stura; 9 miles S.W. of Ceva.

GARRETS, the uppermoſt rooms of a houſe in whole or in part in the roof. When the roof comes very low in the garrets, the angles are cut off by aſhlering, ſo as to have a conſiderable upright on the ſides.

GARRET-DENNIS, in *Geography*, an iſland in the eaſtern Pacific ocean, about 42 miles in circumference, inhabited by blacks, who are armed with lances, bows, and arrows; ſituated to the north of New Ireland. S. lat. 2° 30′. E. long. 151° 25′.

GARRIA, in *Ancient Geography*, an epiſcopal town of Africa, in the Byzacene territory.

GARRICK, DAVID, in *Biography*, was born in Hereford in the year 1716. He was deſcended from a French family, who fled to England on the revocation of the edict of Nantes. His father was a captain in the army, and uſually reſided at Litchfield, but at the time of David's birth he was, in the duties of his profeſſion, at Hereford. The youth was educated partly at the grammar-ſchool at Litchfield, and partly under the celebrated Dr. Johnſon. He was in very early life diſtinguiſhed by his ſprightlineſs, and by a great paſſion for the drama. When he was but eleven years of age, he engaged his young companions to aſſiſt in getting up and acting the Recruiting Officer, in which he took the part of ſerjeant Kite. It was not till he was about nineteen years old, and after he had made a trial in buſineſs, that he was placed under Dr. Johnſon to improve in polite literature. At this period the love of the ſtage had taken ſuch firm poſſeſſion of the mind of young Garrick, that it left little room for claſſical ſtudies, and he was writing ſcenes in comedies, of his own invention, when he ought to have been compoſing ſcholaſtic exerciſes. Whatever might have been his youthful failings, he had the addreſs to ingratiate himſelf with his tutor, and they travelled together to the metropolis about the year 1737. Garrick was at firſt ſent to reſide with Mr. Colſon, an eminent mathematician at Rocheſter, with the intention of obtaining ſome general knowledge previouſly to entering at the Temple. After this, by a change of circumſtances in his family, he entered into partnerſhip with his brother in the wine trade, which he ſoon relinquiſhed with a determination of following his favourite plan of becoming an actor by profeſſion. In 1741 he began a ſummer's campaign at Ipſwich, and played a variety of parts with uniform ſucceſs. From Ipſwich he came to London, and in October of the ſame year he made his appearance at the theatre in Goodman's Fields. He choſe for his firſt part the character of Richard III. as one that would not require a dignity of perſon which he did not poſſeſs; while it would give ſcope to all thoſe ſtrong marks and changes of paſſion in which his principal excellence ever conſiſted. His natural mode of recitation, though a novelty in tragedy to a London audience, produced its intended effect, and never was an audience betrayed into more hearty and unfeigned applauſe. The part was repeated for ſeveral ſucceſſive nights, and was followed by others both in tragedy and comedy; "and ſuch," ſays a critic, "was the blaze of fame attending the new actor, that the eſtabliſhed theatres were deſerted, and ſtrings of carriages from the polite part of the town thronged the ſtreets of the city." While he was at Goodman's Fields he appeared as a dramatic writer in two pieces, entitled "The Lying Valet" and "Lethe," which were well received, and which are ſtill occaſionally acted. In 1742 he was drawn over to the theatre at Drury Lane, and at the cloſe of the ſeaſon he went to Dublin, where he was received with an admiration bordering upon extravagance. Here the theatre was ſo crowded that an epidemic diſeaſe, which broke out in that capital, was called the Garrick fever. Upon his return to London he took up ſome new parts, and among others that of Abel Drugger, in which he excited great ſurprize, by baniſhing from one of the moſt lively and expreſſive countenances every veſtige of ſenſe, and putting on the ſtare of ſtupidity. By this theatrical degradation he is ſaid to have wrought an unlucky cure in a young lady of fortune who had fallen in love with him in the characters of Chamont and Lothario. No actor, it is ſuppoſed, ever more thoroughly adopted, for the time, the characters which he ſuſtained; and his attention to propriety was uniformly

uniformly ſupported by every look and geſture while he continued in ſight of the audience, whether ſpeaking or ſilent. In the ſpring of 1747 he commenced his career as a theatrical manager. He was admitted as an equal partner, and on moderate terms, with Lacy the patentee. The two managers wiſely took different provinces: that of Lacy was the care of the ſcenes, and the domeſtic economy, while Garrick ſuperintended the choice of plays, the diſtribution of parts, and the treaties with authors and actors. The theatre was opened in September 1747, with a prologue by Mr. Johnſon. This was the prelude of a better era of dramatic exhibitions; in particular it uſhered in the revival of a number of Shakſpeare's plays, freed from the taſteleſs and incongruous additions which had been made to them by the writers of the paſt century. Garrick was the living commentator of the great dramatiſt, and by the force of his action he called forth all the latent beauties of the author, and excited in the audience ideas which might otherwiſe for ever have eſcaped their notice.

In 1749 Garrick entered into the marriage life with Mademoiſelle Violetti, who had been a dancer on the ſtage, but who had borne a moſt irreproachable character. The union was a ſource of mutual felicity till it was diſſolved by death. In his character of manager he was frequently engaged in unpleaſant controverſies with authors, though it is admitted on all hands that his treatment of dramatic writers was more liberal than that of former managers. He, however, ſometimes paſſed a judgment upon works which the event proved to be erroneous, nor was he diſpoſed to revoke a ſentence once given. But in general he kept on good terms with the moſt reſpectable writers, and received from many of them that praiſe, to attain which ſeemed almoſt the chief object of his life. By the public, Garrick was ſometimes cenſured as parſimonious, with reſpect to the providing of thoſe ornamental decorations and ſplendid exhibitions, which are as neceſſary to pleaſe the eye, as the more rational part of the entertainment is to ſatisfy the judgment.

In 1763 our author and actor reſolved to relax from his great cares and fatigues in a tour to the continent. Accompanied by his wife, from whom he was inſeparable, he viſited ſeveral parts of Italy and France, and met with flattering notice from many perſons of diſtinction. At this time Mademoiſelle Dumeſnil was the favourite actreſs in Paris, but Garrick, without heſitation, ventured to foretel that Clairon would excel all her competitors, and the reſult verified his predictions. Garrick returned after an abſence of 18 months, and was welcomed with raptures. The prologue ſpoken by him on his firſt night was one of the happieſt efforts of the kind, and he was obliged to repeat it 10 ſucceſſive nights. He was thought to be even improved in his ſtyle of acting, and likewiſe in his general knowledge of drama; and in 1766 he brought out the comedy of "The Clandeſtine Marriage," the joint production of himſelf and Colman. An important event in the life of Garrick was the celebration of the Shakſpeare jubilee. A mulberry-tree, planted at his native town, Stratford-upon-Avon, by the immortal bard, being cut down, the wood of it was converted into a number of toys and implements, which were eagerly purchaſed. The corporation of the town preſented to Garrick the freedom of the place in a box made from the wood of the tree, as a proper compliment to one who had done the poet ſo much honour. This incident ſuggeſted to him the idea of a feſtival in commemoration of Shakſpeare, upon the very ſpot where he was born, and the idea was put into execution in the autumn of 1769. Temporary buildings were raiſed for the occaſion, and various entertainments were planned to ſuit a variety of taſtes. Company of almoſt all ranks, and from diſtant parts of the kingdom, aſſembled to celebrate the memory of the poet. The jubilee laſted three days, but the weather was exceedingly unfavourable, and the pleaſure enjoyed was by no means equal to that which the enthuſiaſtic admirers of Shakſpeare had anticipated. Nevertheleſs Garrick, who was the ſoul of the feſtival, exerted all his talents to gratify both the eye and the underſtanding. He compoſed ſeveral ſongs for muſic, and an ode of conſiderable length to the honour of his hero. Here he expended a conſiderable ſum of money, and in the winter he took a method of reimburſing himſelf. "The jubilee was made a theatrical exhibition, which became ſo popular that it was repreſented, night after night, for more than half the ſeaſon, to crowded audiences."

In 1773 the death of Mr. Lacy threw the ſole management of the theatre on Mr. Garrick, but his health was on the decline, and the period of his life ill adapted to additional labours. He continued, however, in the diſcharge of his profeſſional duties ſome time longer, and rendered an eſſential ſervice to the profeſſion, which he had dignified, by perfecting the plan of an inſtitution for the relief of decayed actors, and he contributed to its fund with much liberality. At length he determined on his retreat, and in January 1776 he parted with a moiety of the Drury-lane patent for the ſum of 35,000*l*. The laſt character in which he appeared was Don Felix in the "Wonder," for the benefit of the theatrical fund. At the concluſion of the play he made a brief farewel addreſs to the audience, which the genuine feelings of regret on both ſides rendered truly pathetic; and few perſons ever quitted a public ſtation with more deſerved plaudits. About Chriſtmas, 1778, being upon a viſit at the ſeat of earl Spencer, he was ſeized with ſome alarming ſymptoms, which induced him to haſten to London. He died on January 20, 1779, and his remains were interred with great pomp in Weſtminſter-abbey, attended by many perſons of the firſt diſtinction in rank and talents. The whole life of Garrick was active, and full of occurrences, which cannot in this ſketch be given with any degree of preciſion. He continued, however, in the unmoleſted enjoyment of his fame and unrivalled excellence to the moment of his retirement. He never had a competitor. Tragedy, comedy, and farce, the lover and the hero, the jealous huſband who ſuſpects his wife without cauſe, and the thoughtleſs lively rake who attacks without deſign, were all alike his own. Rage and ridicule, doubt and deſpair, tranſport and tenderneſs, compaſſion and contempt; love, jealouſy, fear, fury, and ſimplicity, all took, in turn, poſſeſſion of his features, while each of them appeared, on the proper occaſion, to be the ſole poſſeſſor of his heart. In ſhort, Nature, the miſtreſs from whom alone this great performer borrowed all his leſſons, being in herſelf inexhauſtible, this her darling ſon appeared as her trueſt repreſentative, and found an unlimited ſcope for change and diverſity in his manner of copying from her various productions. There is one part of his theatrical conduct which ought to be recorded to Garrick's honour, ſince the cauſe of virtue and morality, and the formation of public manners, are conſiderably dependent upon it; and that is, the zeal with which he aimed to baniſh from the ſtage all thoſe plays which carry with them an immoral tendency, and to prune from thoſe which do not abſolutely, on the whole, promote the intereſts of vice, ſuch ſcenes of licentiouſneſs and liberty as a redundancy of wit and too great livelineſs of imagination have induced ſome of our comic writers to indulge themſelves in, and to which the ſympathetic diſpoſition of the age has given ſanction.

Garrick was in character a man of the world, whoſe vivacity and apparent volatility did not interfere with the ſteady purſuit

purſuit of fame and fortune. In this he was guided by great good ſenſe and diſcretion, and a ſpirit of order and economy. He has been reproached with the imputation of avarice; but his mode of living was hoſpitable and generous, and his bounty frequently flowed in a large ſtream of munificence. His principal foible was vanity, which made him inordinately fond of adulation, as he was impatient of cenſure and ridicule. This propenſity rendered him culpably jealous of rivals, and he is charged with endeavouring to keep down thoſe riſing talents from which he feared competition. In his commerce with the great he was attentive and reſpectful, yet with freedom enough to make him an excellent companion. As an actor, it ſeems to be allowed that none ever ſurpaſſed him in the truth and nature with which he identified himſelf with the fictitious object of his repreſentation, ſo that he ſeemed to have darted his ſoul ſucceſſively into all the forms which he aſſumed. This faculty he diſplayed equally in the moſt comic and the moſt tragic parts, and it has ſcarcely yet been decided in which of the two his chief excellence lay. His voice and his eye were calculated for every poſſible expreſſion of mental feeling. Expreſſion, indeed, was his great ſtrength, and the parts in which he beſt ſucceeded were thoſe in which paſſion moſt predominated. In the enunciation of calm ſentiments, decorated by poetical language, he had ſuperiors. His literary talents were reſpectable; he compoſed ſome ſmart epigrams, many pleaſant and well adapted prologues, entertaining and dramatic pieces, and lively poems of the humorous and familiar claſs.—Davies' Life of Garrick.

GARRIDER, in *Geography*, a town of Hindooſtan, in Guzerat; 60 miles W.S.W. of Gogo.

GARRISON, in the *Art of War*, a body of forces diſpoſed in a fortreſs, to defend it againſt the enemy, or to keep the inhabitants in ſubjection, or even to be ſubſiſted during the winter ſeaſon.

Du-Cange derives the word from the corrupt Latin *garniſio:* which the later writers uſed to ſignify all manner of munition, arms, victuals, &c. neceſſary for the defence of a place, and the ſuſtaining of a ſiege.

Garriſon, and winter quarters, are ſometimes uſed indifferently for the ſame thing; and ſometimes they denote different things. In the latter caſe, a garriſon is a place wherein forces are maintained to ſecure it, and where they keep regular guards; as, a frontier town, a citadel, caſtle, tower, &c. The garriſon ſhould always be ſtronger than the townſmen.

Winter quarters ſignify a place where a number of forces are laid up in the winter ſeaſon, without keeping the regular guard. The ſoldiers, therefore, like better to be in winter quarters than in garriſon.

GARRISON *Carriages* are thoſe on which all ſorts of garriſon pieces are mounted. See CARRIAGE.

GARRISON *Guns*. See CANNON.

GARRISON *Town*, denotes generally a ſtrong place in which troops are quartered, and do duty, for its ſecurity; keeping ſtrong guards at each poſt, and a main guard in, or near the market-place.

GARROWS, in *Geography*, a country of Aſia, ſituated between Bengal and Aſſam.

GARRULUS, in *Ornithology*, a ſpecies of AMPELIS, which ſee. This bird is alſo denominated *garrulus Bohemicus*, the Bohemian magpie, or chatterer. It has a ſharp-pointed creſt on the head reclining backwards, and horny appendages from the tips of ſeven of the ſecondary feathers, of the colour and gloſs of the beſt red-wax; the bill, throat, legs, and tail, are black. The native country of theſe birds is Bohemia, from whence they wander over Europe, feeding on grapes where vineyards are cultivated; and they are eſteemed delicious food. Pennant ſays they appear but by accident in South Britain; about Edinburgh in February, which they viſit annually, feeding on the berries of the mountain-aſh, and as far ſouth as Northumberland, making the berries of the white thorn their food.

GARRULUS is a name given by Briſſon to ſeveral ſpecies of the *Corvus*, which ſee.

GARRULUS *Argentoratenſis*, a name given by Ray to the CORACIAS *Garrula*, which ſee.

GARRY, in *Geography*, a river of Scotland, which runs into the Tay, ſix miles N. of Dunkeld.

GARSCHAW, a town of Pruſſian Pomerelia; 16 miles S. of Dantzic.

GARSDEN, a town of Samogitia; 30 miles W. of Miedniki.

GARSTADT, a town of the principality of Wurzburg; three miles S.S.W. of Schweinfurt.

GARSTANG, a market, corporate town, and pariſh in the hundred of Amounderneſs, and county of Lancaſter, England, contains only 62 houſes and 731 inhabitants. It is ſeated on the weſtern bank of the river Wyre, and on the great road between Lancaſter and Preſton, about eleven miles diſtant from each of thoſe places. This town was incorporated by king Charles II., and is governed by a bailiff and ſeven capital burgeſſes, who are inveſted with authority to try all miſdemeanors committed within their liberty. It has a weekly market on Thurſday, with three annual fairs; and the Lancaſter canal, which now paſſes by it, will be of eſſential advantage in a commercial view, and tend to ſurmount thoſe obſtacles which have operated againſt the eſtabliſhment of any conſiderable manufactory in the town. The pariſh church, which is about a mile to the ſouth, at a place called Garſtang-church-town, having been weakened and undermined by an inundation of the river Wyre, was taken down and rebuilt in the year 1746, at the expence of 1910*l*. It was formerly impropriated to the abbey of Cockerſand, and has chapels at Market-Garſtang and Pilling.

A large printing cotton and calico manufactory has been long eſtabliſhed at Catteral, about two miles ſouth of the town; and at Seorton, three miles; Dolphinholm, five miles; and Catſtraw, ſeven miles, all to the north-eaſt, are various ſpinning manufactories; and another about three miles to the ſouth-eaſt.

Within a mile north-eaſt of Garſtang are the ruins of Greenhaugh caſtle, of which only one tower remains, and that in a very ſhattered ſtate; but it ſeems to have conſiſted originally of ſeven or eight towers of great height and ſtrength. Some writers have dated its foundation in the times of the Saxon heptarchy; but others attribute it to Thomas Stanley, the firſt earl of Derby, in the reign of Henry VII., as a place of protection from the nobles, whoſe eſtates he had obtained on their being proſcribed as traitors.

In the vicinity of the town are Kirkland-hall, the ſeat of Alexander Butler, eſq.; Myerſcough-houſe, an ancient manſion, the ſeat of Charles Gibſon, eſq.; and Claughton-hall, the ſeat of William Fitzherbert Brockholes, eſq. who has greatly improved a large moraſs on his eſtate by means of draining, &c. The Brockholes' family appear to have reſided here from the time of Henry VII.

About three miles W. of Garſtang, is the eaſt-ſide of Pilling-Moſs, the ſcene of a phenomenon, of which an account, to the following effect, was given in the Philoſophical Tranſactions, No. 475. "On Saturday, the 26th of January, 1744-5, a part of Pilling-Moſs, lying between Heſcomb-houſes and Wild Bear, was obſerved to riſe to a ſurpriſing height.

height. After a ſhort time it ſhrunk as much below the level, and moved ſlowly towards the ſouth ſide; and in half an hour it covered twenty acres of land. The improved land adjoining to that part of the moſs, which moves in a concave circle, containing near 100 acres, is nearly filled up with moſs and water, and in ſome parts is thought to be five yards deep. One family is driven out of their houſe, which is quite ſurrounded, and the fabric is tumbling down. The part of the moſs, which is ſunk like the bed of a river, runs north and ſouth, and is above a mile in length, and half a mile in breadth. When the moſs began to move, a man was paſſing over it from the weſt, who perceived, to his great aſtoniſhment, that the ground moved ſouthward. By a ſpeedy return, he had the good fortune to eſcape being ſwallowed up."

GARTACH, a town of Wurtemberg, on a ſmall river which runs into the Necker; 5 miles N.W. of Heilbrunn.

GARTAU, or GARTO, a town of Germany, in the principality of Luneburg-Zell; 48 miles E.S.E. of Luneburg.

GARTEMPE, a river of France, which runs into the Creuſe, near Roche-Poſay, in the department of the Indre and Loire.

GARTER, περιοχελι, a ligature to keep up the ſtockings; it is alſo particularly uſed for the badge or cognizance of a noble order of knights, hence denominated the

GARTER, *Order of the*, a military order, next in dignity after the nobility, inſtituted by king Edward III. in 1344, under the title of the "ſovereign and knights-companions of the moſt noble order of the Garter."

This order conſiſts of twenty-ſix knights, or companions, generally peers or princes; whereof the king of England is the ſovereign, or chief.

The habits and enſigns of this order, moſt of which have been occaſionally varied, with regard to their form, materials, or colour &c. conſiſt of the garter, mantle, ſurcoat, hood, George, and collar.

The *garter* gives denomination to the order, and is deemed ſo honourable, that the bare inveſtiture with it makes the perſon, who receives that honour, a companion of the moſt noble military order ever known. The garter uſed in the ceremony of election, and which each knight wears on the left leg a little below the knee, is of blue velvet, edged with gold; with this motto; "honi ſoit qui mal y penſe," *q. d. ſhame to him that thinks evil hereof*, which is wrought on the garter in ſolid gold; and they bear this motto ſurrounding their arms. The buckle and pendant are richly chaſed and engraved. The meaning of the motto is ſaid to be, that king Edward, having laid claim to the kingdom of France, retorted ſhame and defiance upon him that ſhould dare to think amiſs of the juſt enterpriſe he had undertaken for recovering his lawful right to that crown; and that the bravery of thoſe knights whom he had elected into this order was ſuch as would enable him to maintain the quarrel againſt thoſe who thought ill of it.

They are a college or corporation, having a great and little ſeal; their officers are a prelate, chancellor, regiſter, garter king at arms, and the uſher, or black rod.

Beſides which, they have a dean and twelve canons, with petty canons, vergers, and twenty-ſix penſioners, or poor knights.

The prelate is the head; and the office is veſted in the biſhop of Wincheſter; next to him is the chancellor, which office is veſted in the biſhop of Saliſbury, who keeps the ſeals. The office of regiſter is annexed to the deanery of Windſor. All theſe officers, except the prelate, have fees and penſions.

The order is under the patronage and protection of St. George of Cappadocia, the tutelar ſaint of this kingdom. Their college is held at the caſtle of Windſor, within the chapel of St. George, and the chapter-houſe, erected by the founder for that purpoſe. Their robes, &c. are the garter, decked with gold and gems, and a buckle of gold, to be worn daily; and at feaſts and ſolemnities, a mantle, ſurcoat, high velvet cap, collar of SS's, compoſed of roſes enamelled, &c.

The mantle is the chief of thoſe veſtments made uſe of on ſolemn occaſions. It is of blue velvet lined with white taffeta; and to its collar is faſtened a pair of long ſtrings, with large taſſels, called "cordons," made of blue ſilk intermixed with gold. On the left breaſt of this mantle are placed the arms of the order within the garter, richly embroidered. The mantle worn by the ſovereign is diſtinguiſhed by having a longer train than that of the knights. The mantle, worn by the founder at the firſt feaſt of the order, was of fine woollen cloth, as the mantles then made for the knights undoubtedly were: mantles made of velvet firſt occur about the beginning of the reign of king Henry VI. The colour of theſe mantles is, by the founder's ſtatute, appointed to be blue; and it ſo continued till the reign of queen Elizabeth, when it was changed to purple, and this was retained till about the 12th year of king Charles I., when he reſtored the colour of the mantle to its original inſtitution. In the reign of king Henry VI., it ſeems to have been the mode to ornament the mantle with three or four welts drawn down the ſides and round the bottom.

The *ſurcoat*, or *kirtle*, as well as the mantle, was originally compoſed of woollen cloth, and ſo continued, at leaſt till the reign of Edward IV., about which time it was made of velvet. Anciently, the colour of this veſture changed every year, commonly into blue, ſcarlet, ſanguine in grain, or white; it is now made of crimſon velvet, lined with white taffeta.

The *hood* was formerly worn on the head at all public ceremonies, and made of the ſame materials as the mantle, and ſometimes was trimmed or ſet off with a ſmall proportion of garters; but it is not now uſed in the ſame manner as formerly, but remains fixed to the mantle as part of the habit; and, inſtead of the hood, the ſovereign and knights now wear on their heads a cap of black velvet, deep in the crown, lined with taffeta, and adorned with a large plume of oſtrich feathers, in the centre of which is a tuft or aigrette of heron's feathers; theſe feathers are uſually fixed to the cap by a band of diamonds. The cuſtom of wearing theſe caps and feathers, at the great ſolemnities of the order, had ſometimes been omitted, in and before the reign of James I., and therefore, in a chapter held on the 13th of April, in his 10th year, the cuſtom of wearing the cap and feathers was eſtabliſhed.

The *collar* of the order is of gold, weighing 30 ounces Troy; it is compoſed of 26 pieces, in the form of the garter enamelled blue, with the motto of the order in gold; in the centre of each garter is a roſe, enamelled red, ſeeded gold, and leaved green: theſe 26 garters are faſtened together with as many knots of gold. At the middle of it, pendent to one of the garters, is the *badge* of the order, being the figure of St. George armed, ſitting on horſeback, and with a ſpear, encountering a dragon, which lies on his back under the horſe's feet.

The ſovereign and each knight wear in common the above badge, a figure of St. George within the garter, all of gold, (called the Leſſer George) appendant to a broad deep blue ribbon, which ties on their left ſhoulder, and paſſes thence down

down to their right hip. They are not to appear abroad without the garter, on penalty of 6*s.* 8*d.* paid to the regiſter. On the left breaſt of their coats, cloaks, riding habit, or upper garment, they alſo wear a ſtar of eight points, embroidered with ſilver, having in the centre of it the arms of the order, *viz.* argent, a croſs gules, within a garter.

The manner of electing a knight-companion into this moſt noble order, and the ceremonies of inveſtiture, are as follow. When the ſovereign deſigns to elect a companion of the garter, the chancellor of the order draws up the letters, which, paſſing both under the ſovereign's ſign manual, and ſignet of the order, are ſent to the perſon by Garter principal king at arms; and are to this effect: "We, with the companions of our moſt noble order of the garter, aſſembled in chapter, holden this preſent day at our caſtle at Windſor, conſidering the virtuous fidelity you have ſhewn, and the honourable exploits you have done in our ſervice, by vindicating and maintaining our rights, &c. have elected and choſen you one of the companions of our order. Therefore, we require you to make your ſpeedy repair unto us, to receive the enſigns thereof, and be ready for your inſtallation upon the day of this preſent month, &c." The garter, which is of blue velvet, bordered with fine gold wire, having commonly the letters of the motto of the ſame, is, at the time of election, buckled on the left leg by two of the ſenior companions, who receive it from the ſovereign, to whom it was preſented on a velvet cuſhion by Garter king at arms, with the uſual reverence, whilſt the chancellor reads the following admonition enjoined by the ſtatutes: "To the honour of God omnipotent, and in memorial of the bleſſed martyr St. George, tie about thy leg, for thy renown, this noble garter; wear it as the ſymbol of the moſt illuſtrious order, never to be forgotten or laid aſide; that thereby thou mayeſt be admoniſhed to be courageous, and having undertaken a juſt war in which thou ſhalt be engaged, thou mayeſt ſtand firm, valiantly fight, and ſucceſſively conquer." The princely garter being thus buckled on, and the words of its ſignification pronounced, the knight elect is brought before the ſovereign, who puts about his neck, kneeling, a ſky-coloured ribbon, to which is appendant, wrought in gold within the garter, the image of St. George on horſeback, with his ſword drawn, encountering with the dragon. In the mean time the chancellor reads the following admonition: "Wear this ribbon about thy neck, adorned with the image of the bleſſed martyr and ſoldier of Chriſt St. George, by whoſe imitation provoked, thou mayeſt ſo overpaſs both proſperous and adverſe adventures, that having ſtoutly vanquiſhed thine enemies both of body and ſoul, thou mayeſt not only receive the praiſe of this tranſient combat, but be crowned with the palm of eternal glory." Then the knight elected kiſſes his ſovereign's hand, thanks his majeſty for the great honour done him, riſes up and ſalutes all the companions ſeverally, who return their congratulations.

The order of the Garter appears to be the moſt ancient and noble lay-order in the world. It is prior to the French order of St. Michael, by 50 years; to that of the golden Fleece, by 80 years; to that of St. Andrew, by 190 years; and to that of the Elephant, by 209 years.

Since its inſtitution, there have been eight emperors and twenty-ſeven or twenty-eight foreign kings, beſide numerous ſovereign princes, enrolled as companions thereof.

Its origin is ſomewhat differently related: the common account is, that it was erected in honour of a garter of Joan, counteſs of Saliſbury, which ſhe dropped in dancing, and which king Edward picked up, whereupon ſome of his nobles ſmiling, as at an amorous action, he turned it off with a reply in French, "Honi ſoit qui mal y penſe;" adding, that ſhortly after they ſhould ſee that garter advanced to ſo high an honour, that they would account themſelves happy to wear it; but our beſt antiquaries ſet this aſide as fabulous.

Camden, Fern, &c. take it to have been inſtituted on occaſion of the victory obtained over the French at the battle of Creſſy: that prince, ſay ſome hiſtorians, ordered his garter to be diſplayed as a ſignal of battle; in commemoration of which, he made a garter the principal ornament of the order erected in memory of this ſignal victory, and a ſymbol of the indiſſoluble union of the knights.

Fa. Papebroche, in his analecta on St. George, in the third tome of the "Acta Sanctorum," publiſhed by the Bollandiſts, has a diſſertation on the Order of the Garter. This order, he obſerves, is no leſs known under the name of St. George than under that of Garter, and that, though it was only inſtituted by king Edward III. yet it had been projected before him by king Richard I. in his expedition to the Holy-Land, if we may credit an author who wrote under Henry VIII. Papebroche adds, however, that he does not ſee on what that author grounds his opinion; and that, though the generality of writers fix the epocha of this inſtitution to the year 1350, he rather chuſes, with Froiſſard, to refer it to the year 1344, which agrees better with the hiſtory of that prince, where we read, that he called an extraordinary aſſembly of knights that year.

It appears from Raſtel's Chronicle, lib. vi. quoted by Granger in the Supplement to his Biographical Hiſtory, that this order was deviſed by Richard I. at the ſiege of the city of Acre, when he cauſed twenty-ſix knights, who firmly ſtood by him, to wear thongs of blue leather about their legs, and that it was perfected in the nineteenth year of Edward III. If Edward III. eſtabliſhed this order, he might be induced to do it partly with a view to a reward appropriate to military actions, and partly from a ceremonious reſpect for the ladies.

In 1551, Edward VI. made ſome alterations in the ritual of this order: that prince compoſed it in Latin, the original whereof is ſtill extant in his own hand-writing. He there ordained, that the order ſhould no longer be called the order of St. George, but that of the Garter: and, inſtead of the George, hung at the collar, he ſubſtituted a cavalier, bearing a book on the point of his ſword, with the word *protectio* graven on the ſword, and *verbum Dei* on the book; with a buckle in the left-hand and the word *fides* thereon. Larrey.

For a farther account of the order of the Garter, ſee Camden, Aſhmole, Dawſon, Leland, Polydore Virgil, Heylin, Legar, Glover, and Fauyn.

Erhard, Cellius, and the prince of Orange, adds Papebroche, have given deſcriptions of the ceremonies uſed at the inſtalment of knights. A Ciſtercian monk, named Mendocius Belvaletus, has a treatiſe, intitled La Garretiere, or Speculum Anglicanum, ſince printed under the title of the Catechiſm of the Order of the Garter; wherein he explains all the allegories, real or pretended, of thoſe ceremonies, with the moral ſignifications thereof.

GARTER *principal king at arms*. This office was inſtituted by Henry V.; ſir William Bruges, who, in the year 1417, was Guyenne king of arms, being the perſon who firſt enjoyed the office of garter. Mr. Anſtis has clearly proved, that Bruges muſt have been ſo advanced on the feſtival of St. George, which was held after the 22d of May, and before the 3d of September in the year 1417.

Garter, and *principal king at arms*, are two diſtinct offices united in one perſon: Garter's employment is to attend the ſervice of the order of the garter; for which he is allowed a

mantle

mantle and a badge, a houſe in Windſor caſtle, and penſions both from the ſovereign and knights, and, laſtly, fees. He alſo carries the rod and ſceptre at every feaſt of St. George, when the ſovereign is preſent, and notifies the election of ſuch as are newly choſen; attends the ſolemnity of their inſtallations, and takes care of placing their arms over their ſeats; and carries the garter to foreign kings and princes, for which ſervice it has been uſual to join him in commiſſion with ſome peer, or other perſon of diſtinction.

Garter's oath relates only to ſervices being performed within the order, and is taken in chapter before the ſovereign and knights. His oath, as king at arms, is taken before the earl marſhal. The ſucceſſive garter kings of arms have been conſtituted, for ſome ages paſt, by their reſpective patents "in principalem regem Armorum Anglicorum, et præcipuum officiarium armorum inclyti ordinis Garteri;" with the name, ſtile, and title of Garter. We have the following account of the office by Stephen Martin Leake, eſq. who himſelf filled the ſaid office; "Garter was inſtituted by king Henry A.D. 1417, for the ſervice of the moſt noble order of the Garter, and was made ſovereign, within the office of arms, over all other officers, ſubject to the crown of England, by the name of "Garter King of Arms of England." In his patent he is ſtiled principal king of Engliſh arms, and principal officer of arms of the moſt noble order of the Garter, and has power to execute the ſaid office by himſelf, or deputy, being an Herald. By the conſtitution of his office, he muſt be a native of England, and a gentleman bearing arms. To him belongs the correction of arms, and all enſigns of honour, uſurped or borne unjuſtly; and alſo to grant arms to deſerving perſons, and ſupporters to the nobility and knights of the Bath; to go next before the ſword in ſolemn proceedings, none interpoſing except the Conſtable and Marſhal; to adminiſter the oath to all the officers of arms; to have a habit like that of the Regiſter of the order; Baron's ſervice in the court; lodgings in Windſor caſtle; to bear his white rod, with a banner of the enſigns of the order thereon, before the ſovereign; alſo, when any lord ſhall enter the parliament chamber, to aſſign him his place, according to his dignity and degree; to carry the enſigns of the order to foreign princes; and to do, or procure to be done, what the ſovereign ſhall enjoin, relating to the order; with other duties incident to his office of Principal King of Arms; for the execution whereof he hath a ſalary of 100*l.* a year, payable at the Exchequer, and 100*l.* more out of the revenue of the order, beſides fees."

Garter is alſo a term in *Heraldry*, ſignifying the moiety, or half of a bend.

GARTH, *Sir* Samuel, in *Biography*, an excellent poet and phyſician, was born of a good family in Yorkſhire, and educated at Peter-houſe college in Cambridge, where he took the degree of doctor of phyſic on the 7th of July 1691. His taſte for polite literature induced him to continue his reſidence in college until the period of his graduation; ſoon after which he ſettled in London with a view to practiſe his profeſſion, and was admitted a fellow of the College of Phyſicians on the 26th of June, 1692. At this time the college was embroiled in a diſpute, in conſequence of a charitable inſtitution which they had reſolved to eſtabliſh, for the purpoſe of giving gratuitous advice to the poor, and of furniſhing them with medicines at prime coſt. But this project was oppoſed by the apothecaries, who found means to raiſe a party in the college itſelf againſt it. Dr. Garth, diſapproving the behaviour of the apothecaries, as well as ſome members of the faculty, in this affair, reſolved to expoſe them in a ſatire; which he accordingly executed, with peculiar ſpirit and vivacity, in his admirable poem entitled "The Diſpenſary." The firſt edition of this poem was publiſhed in 1694, and it went through three impreſſions in a few months, in conſequence of which ſucceſs he afterwards made many additions and corrections; and in 1706 he publiſhed a ſixth edition, with ſeveral deſcriptions and epiſodes not before printed. In 1697 he ſpoke the annual ſpeech in Latin, called the Harveian oration, before the college, which was ſoon after publiſhed, and led to a diſcuſſion, whether he was moſt entitled to admiration as a poet or as an orator. In this oration he ridiculed the multifarious claſſes of the quacks with a juſt ſpirit and inimitable humour.

So much literary merit gained him a high reputation as a polite ſcholar, and introduced him to the ſociety and friendſhip of the moſt diſtinguiſhed characters. He was one of the firſt members of the famous Kit-kat club, which conſiſted of above thirty noblemen and gentlemen of diſtinguiſhed talents, and was inſtituted in 1703; with the deſign of ſupporting a warm zeal for the proteſtant ſucceſſion in the houſe of Hanover. On the acceſſion of king George I. to the throne, Dr. Garth had the honour of being knighted with the duke of Marlborough's ſword, and was appointed the king's phyſician in ordinary, and phyſician general to the army. He is ſaid to have had a very extenſive practice, which has rarely fallen to the lot of phyſicians who have commenced their career by the cultivation of poetry. In his practice he conducted himſelf with great moderation as to his views of pecuniary reward, and with a ſtrict regard to the honour and intereſt of the faculty, never ſtooping to proſtitute the dignity of his profeſſion, through mean and ſordid views of ſelf intereſt, to any, even the moſt popular and wealthy apothecaries. In a ſteady adherence to this principle, he concurred with the celebrated Dr. Radcliffe, with whom he was often joined in medical conſultation.

The diſeaſe which ſeized him, and terminated with his life, in January, 1719, occaſioned a general concern, and was particularly lamented by lord Lanſdown, a brother poet, though of a different party, in ſome excellent verſes, as well as by Mr. Pope, in one of his letters. He was buried in the church of Harrow-on-the-Hill, on the 22d of January. See Biograph. Dict. Eloy. Dict. Hiſt.

Garth is uſed in ſome parts of England for a little backſide or cloſe. It is an ancient Britiſh word. *Gardd*, in that language, ſignifies garden, and is pronounced and written garth.

Garth, a term ſometimes employed to denote a ſmall garden, yard, or croft. It is alſo applied to a dam, or wear.

Garth-*men* is uſed in our ſtatutes for thoſe who catch fiſh by means of fiſh-garths or wears.

By ſtatute it is ordained, that no fiſher nor garthman ſhall uſe any nets or engines to deſtroy the fry of fiſh, &c. 17 Ric. II. cap. 9. The word is ſuppoſed by ſome to be derived from the Scotch word *gart*, which ſignifies *forced* or *compelled*; becauſe fiſh are forced by the wear to paſs in a loop, where they are taken.

GARTZ, or Garz, in *Geography*, a town of Pomerania, in the iſland of Rugen, built on the ſcite of an ancient city, called "Carenz," which was deſtroyed by the duke of Pomerania, in the 12th century.—Alſo, a town of Anterior Pomerania, on the Oder, ſurrounded with walls in 1258; 15 miles S. of Old Stettin. N. lat. 53° 16'. E. long. 14° 28'.

GARU, a town of Sweden, in the province of Upland; 20 miles N.N.E. of Stockholm.

GARVAGH, a poſt town of the county of Londonderry, Ireland, near the river Agivey, over which it has two bridges. It is alſo a market and fair town, but is a very ſmall place. It is 100½ miles N. from Dublin, and eight miles S. from Coleraine.

GARVAO, a town of Portugal, in Alentejo, on the Tagus; 12 miles E. of Abrantes.—Alſo, a town of Portugal, in Alentejo, ſix miles W. of Ourique.

GARVELACH, a ſmall iſland near the weſt coaſt of Scotland, in the county of Argyle; eight miles S.E. of Mull iſland. N. lat. 56° 14′. W. long. 5° 44′.

GARVILANS, a ſmall iſland on the north coaſt of Ireland, in the county of Donegal; about two miles E.S.E. from Malin head.

GARUM, a word in very common uſe among the old writers on medicine, who expreſſed by it a pickle, in which fiſh had been preſerved. The principal kind of fiſh they preſerved in this manner was the mackarel.

The garum principally conſiſted of the juices of the fiſh and ſalt; but we find the old writers ſpeaking of ſeveral kinds of it: one they call Spaniſh garum, from the place whence they had it; another kind from its colour was termed the black garum: this laſt kind ſeems to have been that called *fæcoſum* by the Latin poets, as if the fæces and remains of the fiſh were left among it; and by others *garum ſanguineum*, from its being ſometimes tinged with their blood to a reddiſh colour. The Romans ſometimes called the Spaniſh kind, which was eſteemed the beſt, *garum ſociorum*; and Galen ſays that the black garum was called *oxyporum*, but he only means by this, that it was uſed in the preparations called oxypora. It ſerved to dilute them, and thence took the name of them to itſelf, by way of diſtinction from the Spaniſh, and other kinds, not uſed to this purpoſe. Pliny tells us, that garum was compoſed of all the offals of fiſh, of every kind, macerated in ſalt; it had its name, he ſays, from its being originally made of a fiſh, called by the Greeks *garos*, but in his time the beſt ſeems to have been made with the mackarel; but that there were ſeveral other kinds uſed both in food and medicine, ſome of which muſt have been made from ſcarce fiſh, for they were of great price. They were uſed in glyſters, and externally applied in ſeveral kinds of cutaneous eruptions: the ancients had a great opinion of them in glyſters, for removing the pain in the ſciatica, and other like caſes; and the coarſer ſorts were their common medicine for curing cattle of the ſcab, by making inciſions in the ſkin, and laying over the part cloths wetted with them. See Strabo, lib. iii. 109. Plin. lib. xxxi. cap. 8.

The true way in which the ancients prepared their garum, which they ſo much valued as a delicacy at their tables, is unknown to us; but it appears that ſome kinds of garum had no fiſhy matter in them, from Aetius, who gives the following preſcription of a liquor, which he calls by this name: take of common water thirty-one pints, of ſea-ſalt two pints, and of dried figs fifty; let theſe all macerate together, and afterwards be ſtrained clear for uſe. All the garums were eſteemed hot and drying by the ancients, and were ſometimes given as laxatives before food. The modern writers underſtand the word garum in a much more limited ſenſe, meaning no more by it than the brine or pickle in which herrings or anchovies are preſerved.

GARUMNA, in *Ancient Geography*, a river of Gaul, which, as Cæſar informs us, divided the Gauls from the Aquitans; now the *Garonne*, which ſee.

GARWOLIN, in *Geography*, a town of Poland, in the palatinate of Maſovia; 12 miles E. of Czerſk.

GARY, a town of Hindooſtan, in Guzerat; 57 miles E. of Janagur.

GARYENUM, in *Ancient Geography*, a river of Britain, mentioned by Ptolemy, and ſuppoſed to be the river Yare, the mouth of which is at Yarmouth.

GARZETTA, Egret, in *Ornithology*, a ſpecies of *Ardea*, with a creſted head, white body, black bill, and the ſpace about the eyes and the legs greeniſh. The feathers of the creſt are very ſoft and white, and are much valued. It is eaten in Venice and Italy, and common in the markets there. It is the Ardea alba minor, or the ſmall white heron; and it is alſo called *Gaza giovane*. See Heron.

GARZIL, a term ſometimes applied provincially to hedging-wood.

GARZIS, in *Geography*, a town of Africa, in the kingdom of Fez, ſurrounded with walls, and with houſes built of black ſtone, ſituated in a fertile country on the Mulu; 56 miles S. of Melilla.

GARZO, a river of Italy, which paſſes by Breſcia, and joins the Mela, near Manerbio.

GARZONI, Tomaso, in *Biography*, born in 1549 at Bagnacavallo, near Ferrara; he was a regular canon lateran, died in his own country 1589, at 40 years of age. He was author of ſeveral moral works, printed at Venice, 1617, in 4to. But the principal production of this active writer and general reader is entitled "La Piazza univerſale di tutti le profeſſioni del mondo," a work of infinite labour and conſiderable uſe at the time it was written, as the author had almoſt all the materials to ſeek, there being no direct model on ſo extenſive a ſcale then extant. Among innumerable ſubjects included in his plan, his 42d Chap. is appropriated to muſic and muſicians, as well vocal as inſtrumental, to the time when his work was publiſhed. This *diſcorſo* may well be called an epitome of the hiſtory of muſic, ancient and modern, with a liſt of its moſt renowned profeſſors. Whatever muſical hiſtorian had been ſo fortunate as to ſee this work when collecting and ſelecting materials, he would have been ſaved infinite trouble in his reſearches, by finding where muſic had been treated incidentally as well as *ex profeſſo*. This author had chiefly educated himſelf, and learned, without a maſter, Hebrew and Spaniſh. His "Piazza Univerſale" ſeems firſt to have been publiſhed at Venice, the year in which he died, and afterwards went through innumerable editions. Superficial knowledge only is to be found in his book; but it points out where more and better information may be found. It has been truly ſaid by Father Niceron, that the works of Garzoni prove him to have dipt into all the ſciences, and ſufficiently manifeſt the extent of his knowledge, and of what he would have been capable with a regular education and a longer life. His reflections, when he allows himſelf time to make them, and room in his book for their inſertion, are excellent. But the taſk he had ſet himſelf was too great for a ſingle mind, or the bodily labour of an individual.

It is extremely difficult to render the title of this book in Engliſh; the word Piazza has twelve or fourteen different meanings and ſhades of meaning in the Cruſca: it implies a ſquare or market-place appropriated to commerce. Perhaps "the univerſal commerce of all the arts and profeſſions in the world" may nearly expreſs the author's meaning.

It is ſingular that this work is unnoticed in the Bibl. Ital. of Fontanine.

GAS, a generic name given by Van Helmont to elaſtic fluids, and now generally adopted. The term *air* was made generic

generic by Prieſtley; but this ſeems rather to imply that elaſtic fluids are only modifications of common or atmoſpheric air, the contrary to which is now known to be true. The term gas is therefore properly preferred.

Though the obſervations of Van Helmont, Boyle, Hales, Black, and Cavendiſh, ſeemed to leave no doubt that there exiſted three or four kinds of air or fluids agreeing in the property of elaſticity, yet no very diſtinct notion was formed on the ſubject, till the diſcoveries of Prieſtley and thoſe of Lavoiſier illuminated the ſphere of chemical ſcience. Since then moſt chemical enquiries have been connected with the knowledge of gaſeous bodies, and great addition has been made to the number of gaſes and to the knowledge of their diſtinctive properties. Elaſtic fluids have in fact been divided into two genera, *gaſes* and *vapours*; the former ſignify ſuch elaſtic fluids as retain their elaſticity in all known temperatures; the latter ſignify thoſe elaſtic fluids which loſe their elaſticity by cold, and become liquids, &c. This diſtinction may have its uſe; but there is great reaſon to believe the difference is not in kind but in degree only; and that all the gaſes would loſe their elaſticity provided the temperature could be ſufficiently reduced.

The mechanical properties of the gaſes, or thoſe relating to their elaſticity and gravitating energy being, as far as is known, the ſame as thoſe of the atmoſphere, will be ſtated under the head of PNEUMATICS. The other general properties, which fall rather under a chemical than mechanical head, will be pointed out and explained in what follows; and a more detailed account of each gas will be found under its ſpecific name.

Gaſes may be conſidered as *ſimple* or *compound*. The ſimple gaſes, according to our preſent knowledge, are three; namely,

1. Hydrogen.
2. Oxygen.
3. Azote or nitrogen.

The compound gaſes and vapours which have been clearly diſcriminated from each other are,

4. Nitrous gas, from azote and oxygen.
5. Nitrous oxyd, from azote and oxygen.
6. Carbonic oxyd, from carbon and oxygen.
7. Carbonic acid, from carbon and oxygen.
8. Carburetted hydrogen, from carbon and hydrogen.
9. Olefiant gas, from carbon and hydrogen.
10. Sulphuretted hydrogen, from ſulphur and hydrogen.
11. Sulphurous acid, from ſulphur and oxygen.
12. Fluoric acid, from hydrogen and oxygen?
13. Muriatic acid, from hydrogen and oxygen?
14. Oxymuriatic acid, from muriatic acid and oxygen.
15. Ammoniacal gas, from azote and hydrogen.
16. Phoſphuretted hydrogen, from phoſphorus and hydrogen.
17. Arſeniuretted hydrogen, from arſenic and hydrogen.
18. Nitric acid, from azote and oxygen.
19. Nitrous acid, from azote and oxygen.
20. Aqueous vapour or ſteam, from oxygen and hydrogen.
21. Alkoholic vapour, from carbon and hydrogen.
22. Ethereal vapour, from carbon and hydrogen.

It is particularly remarkable that in all the above liſt of compound gaſes no one has been proved to contain more than two elements. Though Berthollet and ſome others conceive certain gaſes to contain *three* elements; namely, carbon, hydrogen, and oxygen, and hence denominate them *oxy-carburetted* hydrogen; yet they have given no deciſive proof of the exiſtence of ſuch gaſes. Indeed it is almoſt obvious that all the gaſes which have been adduced of this triple character are nothing but mere mixtures of hydrogen, carbonic oxyd, and carburetted hydrogen from ſtagnant water. We may well heſitate to admit ſuch diſtinction till ſome one can point out a method of obtaining a gas uniformly the ſame, and which cannot be procured by mixing the above three or any others in any proportion. The conſtitution of the fluoric and muriatic acid gaſes is not yet fully known; but there is great reaſon to ſuſpect, from the recent diſcoveries of Davy, that oxygen and hydrogen are the chief, if not the only elements. Poſſibly it may be found that *three* elements cannot unitedly conſtitute an elaſtic fluid.

We ſhall now conſider, 1ſt. The nature of ſimple gaſes; 2d. The nature of compound gaſes; 3d. The nature of gaſeous mixtures; and, 4th. We ſhall exhibit tables ſhewing the more remarkable properties of the gaſes in one point of view, with obſervations, &c.

1. *The Nature of ſimple Gaſes.*—The conſtitution of an elaſtic fluid was firſt pointed out and demonſtrated by Newton in the 23d prop. of the ſecond book of the Principia; namely, that it conſiſts of particles which repel one another by a force which varies in the ſimple inverſe ratio of the central diſtances. At leaſt a fluid ſo conſtituted would exhibit the ſame mechanical properties as atmoſpheric air. On the nature of this repulſive power there have been ſeveral ſpeculations; ſome have imagined it to be magnetical; others electrical; and others, with more ſeeming probability, have aſcribed it to heat. Indeed, when it is conſidered that the elaſticity increaſes and diminiſhes with the temperature to the moſt diſtant points we can attain, heat muſt be a principal if not the ſole cauſe of aerial repulſion. On this idea a particle of an elaſtic fluid may be ſuppoſed an indefinitely ſmall, hard, and indiviſible body, ſurrounded by an infinitely fine and ſubtile fluid, heat, forming a kind of atmoſphere around it of comparatively great extent, but variable according to preſſure, &c. This atmoſphere will be of greateſt denſity at the ſurface of the particle, and of leſs denſity in ſome proportion to the diſtance.

Mr. Dalton has developed and extended this notion, of heat being the cauſe of repulſion, in his New Syſtem of Chemical Philoſophy. He deduces a very curious concluſion, and very important one, if it be true, that all elaſtic fluids contain the ſame quantity of heat attached to their ultimate particles, whether ſimple or compound, in like circumſtances; and that a greater or leſs attraction of the particles for heat will have no influence in this reſpect, but only to condenſe a greater number of them into the ſame ſpace. If this concluſion be correct, the capacities of elaſtic fluids for heat will be proportional to the number of their particles in a given volume. Aſſuming *data*, the accuracy of which he promiſes to demonſtrate, namely, the relative weights of the ultimate particles of certain gaſes, as in the following table, he derives the ſpecific heats agreeable to the above hypotheſis, as follows.

	Relative Weights of ultimate Particles.	Specific Heat of equal Weights.
Hydrogen	1	9.382
Azote	5	1.866
Oxygen	7	1.333
Atmoſpheric air	0	1.759
Nitrous gas	12	.777
Nitrous oxyd	17	.549
Carbonic acid	19	.491
Ammoniacal gas	6	1.555
Carburetted hydrogen	7	1.333
Olefiant		

	Relative Weights of ultimate Particles.	Specific Heat of equal Weights.
Oleſiant gas	6	1.555
Nitric acid	19	.491
Carbonic oxyd	12	.777
Sulphuretted hydrogen	16	.583
Muriatic acid	22	.424
Aqueous vapour	8	1.166
Ethereal vapour	11	.848
Alkoholic vapour	16	.586
Water	0	1.000

2. *The Nature of compound Gaſes.*—By a compound gas we mean an elaſtic fluid which ariſes from the chemical union of the elements of two or more elaſtic fluids, or of one elaſtic fluid and another inelaſtic body; thus, a certain quantity of carbonic oxyd gas and oxygen gas may be combined ſo as to make carbonic acid gas, which is different from either of the ingredients in volume, and in other eſſential properties. Alſo, from oxygenous gas and ſulphur may be formed ſulphurous acid gas. Theſe compound gaſes are chiefly modern diſcoveries, and their nature has never yet been very ſatisfactorily explained. They are obſerved to agree with the ſimple gaſes in their mechanical relations. From this fact it would ſeem that by applying the Newtonian doctrine they muſt be conſtituted of particles repulſive of each other, like the ſimple gaſes. Theſe particles muſt be compounded, and in all probability of the elementary particles of the ſimple gaſes; that is, a particle of a ſimple gas, A, muſt be united to one, or more, particles of another body B; and the new compound may be ſurrounded with an atmoſphere of heat, and form a particle of a compound gas C. In this way, if we may ſuppoſe all ultimate particles of the ſame kind to be exactly alike, compounds of various, but ſimple relations in quantity, ſuch as thoſe of 1, 2, 3, may be formed; and many of the phenomena indicate ſuch relations. For inſtance, the above-mentioned carbonic acid gas contains, according to the beſt experiments, juſt *twice* as much oxygen as the carbonic oxyd contains from which it is produced, indicating that if a particle of the latter gas contains *one* of oxygen, a particle of the former muſt contain *two* particles of oxygen.

3. *The Nature of gaſeous Mixtures.*—Dr. Prieſtley, in the courſe of his intereſting enquiries in pneumatic chemiſtry, could ſcarcely fail to notice a remarkable fact which ſubſequently has occaſioned much diſcuſſion; namely, that gaſes of different ſpecific gravities intermix in oppoſition to their gravitating tendencies, and when once completely diffuſed through each other, remain ſo notwithſtanding their reſt. Yet it does not appear that any chemical affinity is exerciſed; or, if it were, would it account for the phenomena. He has given us a ſection on this very ſubject, wherein he eſtabliſhes the fact by experiments; but he does not ſatisfy himſelf by any explanation. The fact has ſince been corroborated by a ſeries of experiments directed towards this point by Dalton, in the Mancheſter Memoirs, vol. i. new ſeries, and by Berthollet, in the ſecond volume of the Memoires d'Arcueil. The latter of theſe philoſophers, however, finds a conſiderable difference in the *times* which the different gaſes take to become uniformly diffuſed through each other. Thus, hydrogen is diffuſed more quickly, and carbonic acid more ſlowly than the reſt. The atmoſphere is an example of two gaſes of different ſpecific gravities, which permanently continue to be diffuſed through each other. Many modern philoſophers reſt ſatisfied with the explanation which aſcribes the effect to a ſlight chemical affinity; but though this might perhaps be admitted, were it only required to account for gaſes remaining in a ſtate of diffuſion, yet it does not provide for a heavy gas, as carbonic acid, being drawn up to the top of a receiver to the diſtance of a foot or more from its natural ſituation. Mr. Dalton, ſome time ago, ſuggeſted an hypotheſis which effectually explained the whole phenomena, but the hypotheſis on other accounts was deemed too improbable. It conſiſted in the ſuppoſition that the particles of different gaſes were neither attractive nor repulſive of each other, but neutral; ſo that any gas was impelled by its own repulſion to fill any ſpace in which it might be found, juſt as if it were the only gas preſent. This hypotheſis the author himſelf has abandoned, and now, in conſequence of further elucidation which time and reflection have produced, he aſcribes the effects in queſtion to the different ſizes of the ultimate elaſtic particles of different gaſes. He attempts to eſtabliſh the poſition "that every ſpecies of pure elaſtic fluid has its particles globular and all of a ſize, (meaning the ſolid central atom, together with its atmoſphere of heat,) but that no two ſpecies agree in the ſize of their particles," the preſſure of temperature being the ſame. Alſo that heat is the cauſe of repulſion. From theſe conſiderations he concludes that no one elaſtic fluid can reſt permanently on another, unleſs they happen to have ultimate particles of exactly the ſame ſize, which probably does not take place in any two gaſes. This explanation deſerves attention; time will ſhew how far it is ſatisfactory. See New Syſtem of Chemical Philoſophy, page 188.

Some gaſes, when mixed, combine with each other; others are merely diffuſed through the whole ſpace. Of ſome of theſe mixtures it may be proper to take a little notice.

1. Hydrogen mixes with azote, nitrous gas, carbonic oxyd and acid, carburetted, ſulphuretted, and phoſphuretted hydrogen, ammoniacal gas, &c. without undergoing any change.

2. Hydrogen mixes with oxygen and nitrous oxyd without any change; but an electric ſpark unites the oxygen to the hydrogen, and forms water, and in the latter caſe azotic gas likewiſe.

3. Hydrogen mixes with oxy-muriatic acid without any change in the firſt inſtance; but an electric ſpark converts the mixture into muriatic acid and water. This effect may alſo be produced by expoſing the mixture of gaſes to the ſun's rays, when after a few moments an exploſion takes place.

4. Oxygen and nitrous gas inſtantly combine and form nitric or nitrous acid; oxygen mixes with moſt or all other gaſes without any change; but an electric ſpark unites it to ſome element, when mixed with carbonic oxyd, oleſiant gas, carburetted, ſulphuretted, and phoſphuretted hydrogen, and ammoniacal gas.

5. Azotic gas mixes with all other gaſes without any change.

6. Oxymuriatic acid gas converts nitrous gas into nitric acid. When mixed with hydrogen, and expoſed to light, water and muriatic acid are formed; if expoſed to the direct rays of the ſun, when above 30° of altitude, an exploſion enſues, as has lately been diſcovered by Gay Luſſac, and Thenard in France, and by Dalton in England. When mixed with with carburetted hydrogen, carbonic oxyd, or oleſiant gas, and expoſed to the ſun, over water, a pretty rapid combuſtion enſues. Moſt of theſe mixtures too explode with an electric ſpark, that with carbonic oxyd excepted. This gas acts upon ſulphuretted and phoſphuretted hydrogen gaſes in mixture; and converts ſulphurous acid gas into ſulphuric acid.

7. Ammoniacal gas combines with the ſeveral acid gaſes and forms with them ſalts.

4. *Tables exhibiting the weights, ſpecific gravities, conſtituent principles, &c. of the principal gaſes.*

1.—TABLE

Of the weights, ſpecific gravities, and volume of the gaſes abſorbed by water

N. B. The weights, &c. are at a mean temperature and preſſure; and water is ſuppoſed 820 times the weight of common air.

Kind of Gas.	Weight of 100 cubic Inches in Grains.	Specific Gravity.	Volume of Gas abſorbed by a given Volume of Water.
Atmoſpheric air	31	1.00	$\frac{1}{50}$
Hydrogen	2.5	0.08	$\frac{1}{64}$
Oxygen	34	1.10	$\frac{1}{27}$
Azote or nitrogene	30.2	0.97	$\frac{1}{64}$
Nitrous gas	32.2	1.04	$\frac{1}{27}$
Nitrous oxyd	50	1.60	1 nearly
Carbonic oxyd	29	0.94	$\frac{1}{27}$
Carbonic acid	47	1.52	1
Carburetted hyd. from ſtagnant water	18.6	0.6	$\frac{1}{27}$
Olefiant gas	29.5	0.95	$\frac{1}{8}$
Sulphuretted hydrogen	36	1.16	1
Sulphurous acid	71	2.30	20
Fluoric acid (ſilicated)	130	4.20	400
Muriatic acid	39.5	1.24	400
Oxymuriatic acid	76	2.46	2
Ammoniacal gas	18.6	0.60	400
Phoſphuretted hydrogen	26	0.84	$\frac{1}{27}$
Nitric acid	76	2.4	—
Aqueous vapour	21	0.7	—
Alkoholic vapour	65	2.1	—
Ethereal vapour	70	2.25	—

The weights and ſpecific gravities in the above table are taken from the moſt reſpectable authorities. Indeed the reſults have been obtained ſo nearly the ſame by different authors, that there can be no doubt of their being good approximations to truth. A ſtill greater degree of accuracy is however both deſirable and attainable. Some of the above tabular numbers muſt be conſidered as more doubtful than others; becauſe few experiments have been made, and thoſe liable to objections. This obſervation applies more directly to fluoric, oxymuriatic, and nitric acid gaſes, and to phoſphuretted hydrogen, and to the vapours.

In regard to the quantity of any gas abſorbed by water when duly agitated together, it is obſervable that water takes juſt its own volume of ſome of the gaſes; in other inſtances, it takes ſome fractional part of its volume, which fraction has always for its numerator unity, and for its denominator the cube of ſome one of the ſeries 1, 2, 3, &c. thereby indicating that the diſtance of the particles of air in the water is always 1, 2, 3, &c. times their diſtance out of the water. There is an apparent exception in atmoſpheric air; but this is in reality a confirmation of the rule; for the atmoſphere is compoſed of 4 parts of azotic gas, and 1 of oxygen; and $\frac{4}{5}$ of $\frac{1}{64} + \frac{1}{5}$ of $\frac{1}{27} = \frac{1}{50}$ nearly. Whether the elaſticity of the gaſes in this their connection with water is impaired or deſtroyed are objects of enquiry. According to Dr. Henry's experiments, the quantity of any gas abſorbed (not exceeding unity) is in direct proportion to the preſſure of the gas of its own kind; and that preſſure being removed, the internal or abſorbed gas is conſtantly making its eſcape. It muſt therefore retain its elaſticity. The obſervation will apply even to thoſe gaſes that are ſo largely abſorbed by water; their elaſticity muſt indeed be amazingly impaired by the action of the water, but it is not deſtroyed; for the gaſes are conſtantly making their eſcape from the water, unleſs reſtrained by an incumbent atmoſphere of their own kind. It ſhould ſeem then, that the connection of theſe gaſes with water, which have not their elaſticity impaired, is purely of a mechanical nature; whilſt that of the very abſorbable gaſes is partly of a mechanical and partly of a chemical nature.

The following table exhibits the volumes of certain elaſtic fluids which combine, and the correſponding volume of the new compound, when elaſtic; alſo the proportional weights of the ſimple elements in a given weight of the compound.

2.—TABLE

Of the Proportions of the conſtituent Principles of compound Gaſes.

Compound Gaſes, &c.	Conſtituent Principles in Meaſures.			Conſtituent Principles in Weights.			
	Meaſures.	Meaſures.	Meaſures.	Weight.	Weight.	Weight.	
Ammoniacal gas	100	= 52 azote	+ 133 hydrogen	83 azote	+ 17 hydrogen	= 100	
Water	—	= 100 oxyg.	+ 200 hydrogen	87½ oxyg.	+ 12½ hydrogen	—	
Nitrous gas	100	= 47 azote	+ 55 oxygen	42 azote	+ 58 oxyg.	—	
Nitrous oxyd	100	= 99 azote	+ 58 oxygen	59 azote	+ 41 oxyg.	—	
Nitric acid	—	= 180 nitrous gas	+ 100 oxygen	27 azote	+ 73 oxyg.	—	
Nitrous acid	—	= 360 nitrous gas	+ 100 oxygen	33 azote	+ 67 oxyg.	—	
Oxymuriatic acid	100	= 150 mur. acid	+ 50 oxygen	76 mur. acid	+ 24 oxyg.	—	
Sulphurous acid	100	= 100 oxygen	+ ſulphur	52 oxyg.	+ 48 ſulphur	—	
Sulphuric acid	—	= 100 ſulphurous acid	+ 50 oxygen	79½ ſulphurous acid	+ 20½ oxygen	—	
Carbonic oxyd	100	= 47 oxygen	+ charcoal	55 oxygen	+ 45 charcoal	—	
Carbonic acid	100	= 100 oxygen	+ charcoal	72 oxygen	+ 28 charcoal	—	
Carburetted hydrogen	100	= 200 hydrogen	+ 1 part charcoal	27 hydrog.	+ 73 charcoal	—	
Olefiant gas	100	= 200 hydrogen	+ 2 parts charcoal	15 hydrog.	+ 85 charcoal	—	
Sulphuretted hydrogen	100	= 100 hydrogen	+ ſulphur	7 hydrog.	+ 93 ſulphur	—	
Phoſphuretted hydrogen	100	= 100 hydrogen	+ phoſphorus	10 hydrog.	+ 90 phoſphorus	—	
Muriate of ammonia	—	= 100 mur. acid	+ 100 ammon. gas	65 mur. acid	+ 35 ammon. gas	—	
Carbonate of ammonia	—	= 100 carb. acid	+ 80 ammon. gas	76 carb. acid	+ 24 ammon. gas	—	
Sub-carbonate of ammonia	—	= 100 carb. acid	+ 160 ammon. gas	61 carb. acid	+ 39 ammon. gas	—	

In the 2d vol. of the Memoires d'Arcueil, Gay Luſſac has two ingenious eſſays, the one on the combination of gaſeous ſubſtances one with another, and the other on nitrous vapour and nitrous gas, in which he advances an hypotheſis that gaſeous ſubſtances always combine with each other, either in equal volumes, or in volumes which are ſmall ſimple multiples one of the other. For inſtance, he argues that 100 meaſures of oxygenous gas united with 200 meaſures of nitrous gas, conſtitute nitric acid, and with 300 meaſures of nitrous gas, nitrous acid. Now every one, who has had experience on this ſubject, knows that 100 meaſures of oxygen are convertible into an acid vapour by 180 of nitrous gas or leſs, if properly mixed. What then is this acid? It cannot, according to Gay Luſſac, be either the nitric or nitrous. Again, by proper treatment, 100 meaſures of oxygen may be made to unite with 320, 340, or 360 nitrous gas, by preſenting two thin ſtrata of the gaſes to each other over water in a wide veſſel. And as all intermediate proportions between 140 and 360 meaſures of nitrous gas may eaſily be united with the oxygen, there is not any apparent reaſon for ſelecting 200 and 300 meaſures of nitrous gas as forming the only definite compounds. Gay Luſſac has given a table analogous to the above, founded on his hypotheſis, but our proportions differ very materially from thoſe of his table, and we have no doubt as to their ſuperior accuracy in general, as they are the reſults of experience.

We ſhall conclude this article with the following table of the proportions of certain combuſtible gaſes and oxygen, which unite by the electric ſpark in Volta's eudiometer, and the products formed.

3.—TABLE

Of the Combination of combuſtible Gaſes with Oxygen, and the Products.

Meaſures of pure Gas.	Meaſures oxygen.	Meaſures carbonic acid.
100 Carbonic oxyd, unite to	47	products 94
100 Carburetted hydrogen	200	—— 100 + water
100 Olefiant gas	285	—— 190 + water
100 Sulphuretted hydrogen	150	—— 100 ſulphurous acid + water
100 Phoſphuretted hydrogen	150	—— phoſphoric acid + water
100 Ammoniacal gas	67	—— 52 azote + water

GAS, in *Agriculture* and *Vegetable Economy*, an aëriform fluid material, which is ſuppoſed to be taken up as the food of plants. There are ſeveral kinds that are believed to be uſeful in this way, as the ammoniacal, the carbonic acid gas, &c. See FOOD *of Plants*, and VEGETATION.

GAS *Light, Apparatus for producing*. The light and heat procured by the combuſtion of carburetted hydrogen gas, is one of thoſe recent inventions which promiſes to be of the moſt general utility, though it may be ſaid to be at preſent in its infancy; the inflammability of the gas, produced from the diſtillation of pit coal, has long been a fact familiar to chemiſts, though it is only within theſe few years that experiments have been made, with a view to determine the beſt form of an apparatus for producing the gas, at the leaſt expence of fuel for the diſtillation, and at the ſame time to ſeparate from it the tar and ammoniacal fluid which are thrown out from the coals with it; and would, if ſuffered to remain with the gas, cauſe many inconveniences from their intolerably offenſive ſmell, but may, when ſeparated, be applied to uſeful purpoſes.

Mr. Murdoch was probably the firſt perſon who put in practice gas lights on an extenſive ſcale; he commenced his experiments on this ſubject in the year 1792, and in 1798 he applied it for the lighting part of the very extenſive manufactory of Meſſrs. Boulton, Watt, and Co. at Soho near Birmingham, and in 1802, at the time of the Peace, the illumination of the Soho works was made by gas. Since this period, the method has been adopted in many places by different individuals, who, proceeding from their own ideas, naturally introduced various forms of the apparatus, the moſt perfect of which we propoſe to deſcribe with drawings, in ſuch a manner as to enable mechanics to conſtruct them, this being the moſt probable means of their being farther improved, and their advantages more fully eſtabliſhed. The carburetted hydrogen gas is produced in the following manner: A quantity of pit coal is introduced, and cloſed up in an iron retort, diſpoſed in a proper furnace, by which it can be heated ſo as to throw out the volatile portions of the coals; theſe are conducted by a pipe into a refrigeratory, where the tar and ammoniacal fluid are depoſited: the gas then enters into a gazometer, being in its way paſſed through water to waſh and take from it any remaining tar or other impurities which may cauſe an unpleaſant ſmell. The gazometer is fitted up in the ſame manner as for other chemical experiments, riſing and falling freely in water to regulate the admiſſion of the gas, which is conveyed by pipes from it to the burners or lamps where it is conſumed. Theſe are formed in various ways, either a tube ending with a ſimple orifice, at which the gas iſſues in a ſtream; and if once lighted will continue to burn with the moſt ſteady and regular light imaginable, as long as the gas is ſupplied. At other times a number of very minute holes are made in the end of a pipe, which form as many *jets de feu*, and have a very brilliant appearance. This may ſometimes be placed in the focus of a parabolic reflector. In caſes where the light is required to be thrown to a diſtance, other burners are conſtructed upon the ſame principle as the Argand lamp, forming a cylinder of flame, and admitting a current of air both to the inſide and outſide.

Fig. 1. of *Plate* XVII. *Miſcellany*, is a ſection of an apparatus for producing the gas adopted by Mr. Samuel Clegg of Mancheſter, and communicated to the Society of Arts in 1808, when they voted Mr. C. a ſilver medal for the communication. A repreſents a caſt iron retort, in which are put the coals, to be decompoſed by the heat of a fire applied beneath it. The retort is ſituated in a chamber repreſented by the dark ſpace, in which the flame from the coals placed upon the grate B circulates all round the retort, and eſcapes by the chimney D; E is the aſh-pit beneath the grate; the double thickneſs of metal beneath the retort denotes a ſaddle or half cylinder of caſt iron, which preſerves that part of the retort which is moſt expoſed, and cauſes it to be heated more uniformly; F is the mouth where the coals are introduced, it has a flaunch and a cover ground together, air tight, and faſtened by a ſcrew in the centre, or by one at each ſide; *a* is an iron pipe conducting from the retort to a veſſel G, ſituated

G, ſituated beneath the gazometer: in this veſſel the tar and other condenſible products are ſeparated from the gas, which aſcends the pipe *b*. The upper end of this is covered in the manner of a hood by a cylindric veſſel *d*, open at bottom, but partially immerſed beneath the ſurface of the water contained in the ciſtern of the gazometer, and perforated round, near the lower edge, with a number of ſmall holes. The gas diſplaces the water from the receiver *d*, and eſcapes through the ſmall holes riſing in bubbles through the water, ſo as to expoſe a large ſurface to its action, that it may be waſhed and purified from any ſmell. After riſing through the water, the gas enters the gazometer H H, which is ſuſpended to move up and down by the chains and pulley *e e*, and balance weights *f*, *f*. In the centre of the gazometer a tube *g* is fixed, having ſome ſmall holes at its upper end, by which it communicates with the interior of the gazometer. This tube includes another, *h*, fixed perpendicular from the bottom of the ciſtern, and communicating with others *k*, which convey the gas to the burners. The fixed pipe *h* forms a guide to keep the gazometer always perpendicular; and the pipe in the centre of the gazometer prevents any gas paſſing away except it has aſcended to the top of that veſſel, and is tranſparent and fit for uſe. The gazometer is made of iron plate rivetted together, and ſuſtained by a ſtrong hoop at top and another at bottom. Each hoop has radial bars which ſupport the tube *g* in the centre, and at the ſame time they ſtrengthen the whole. The gazometer muſt be painted within and without to preſerve it from ruſting. Mr. Clegg ſays, a veſſel of this kind, to contain 700 cubic feet of gas, will weigh about 20 cwt.

When the operation commences, the gazometer is ſunk down nearly to a level with the ſurface of the water in the ciſtern L L; but as the gas enters, it riſes up to receive it. It is to be noted, that the balance weights *f*, *f*, ſhould not be quite ſo heavy as the gazometer, in order that ſome preſſure may be exerted, to force the gas out of the burners with a proper jet. The gas which iſſues from the retort enters the receiver G, aſcends the pipe *b*, into the veſſel *d*, from which it diſplaces the water, and paſſes out at the ſmall holes as before deſcribed, riſing through the water into the gazometer, and raiſing it up: the gas then paſſes away to the burners. In this manner the proceſs proceeds, until the whole of the volatile products of the coals in the retort is evaporated. The uſe of the gazometer is, to equalize the emiſſion of the gas which comes from the retort more quickly at ſome time than others. When this happens, the veſſel riſes up to receive it, and when the ſtream from the retort diminiſhes, the weight of the gazometer expels its contents. When the proceſs is finiſhed, the retort is ſuffered to cool, and its lid is then removed to repleniſh it with coal. The caput mortuum, which is found in the retort, is the moſt excellent coak, and in value returns a conſiderable portion of the whole expence of fuel when the retort cools. The veſſel *d* contains a ſufficient quantity of gas to ſupply any abſorption which takes place without raiſing the water into the retort.

In Mr. Clegg's original apparatus the chains for the balance weight are attached to the top of the gazometer; and the ciſtern L, for containing the water of the gazometer, is repreſented as a well ſunk in the ground. This method is cheap and ſimple, though at the ſame time it is liable to have leaks, which are not eaſily diſcovered or acceſſible to be ſtopped; and it requires conſiderable length of pipes to draw off the matter from the receiver G; whereas in the conſtruction repreſented in the plate, they are drawn off by the cock at *x*. Of theſe products we ſhall ſpeak more in another place.

Figs. 2 and 3 repreſent one of the gas lamps on the principle of Argand; the ſpace between the two concentric tubes *a*, *b*, is ſupplied with gas by a pipe, *c*, in which is a cock, *d*, to regulate or occaſionally intercept the gas. The ſpace between the two tubes is covered at top with a circular ring, ſhewn in *fig.* 2, pierced with a number of ſmall holes, at which the gas iſſues, forming a cylinder of flame, to which a current of air is brought through the internal tube *d*. The air has alſo paſſage beneath the glaſs chimney, *f*, to ſupply the outſide of the flame, which is rendered the moſt ſteady and regular imaginable, by the draught cauſed by the chimney: *g* is a ſmall button affixed to a ſtem, which ſlides up and down in the interior tube with ſufficient friction to retain its poſition. The button conveys the current of air riſing through the tube in an expanded cone to the inſide of the flame, and aſſiſts the combuſtion in a great degree.

The next apparatus for gas lights which we ſhall deſcribe is by Dr. Stancliffe, as ſhewn in *fig.* 4. A is a veſſel of caſt-iron, forming the retort, and is ſet in brick-work in any proper furnace; E is a rim caſt in the ſame piece, incloſing the top of the former, ſo as to make a deep groove all round in the top of the veſſel. In this groove the head, F, of the veſſel is received; and to make the fitting air-tight, a quantity of fuſible alloy is placed in the groove. This melts by the heat of fire, and forms a fluid luting, which prevents the eſcape of the gas. G is a tube leading from the head to the refrigeratory E F; the joining of this tube with this veſſel is formed by a joint, on a ſimilar principle to the joining of the head with the retort: *a* is a tube paſſing through the lid of the veſſel, and another, *b*, is fixed concentric to and ſurrounding the former at a ſmall diſtance. The ſpace between theſe is filled with water, and the tube, G, which connects with the head, is immerſed in the water which forms the joint round the pipe, and by this means the tube, G G, and the head, F, of the retort, can be removed together to take out the coak and introduce freſh coals. The refrigeratory is made in two diviſions E and F, one above the other; the tube G goes down nearly to the bottom of the loweſt diviſion, and the gas bubbles up from the end of it through the water, with which the lower partition is partly filled: it then paſſes out at the pipe, *d*, to the burners. Theſe muſt not be of ſuch a number as to conſume the gas as faſt as the retort produced it; by this means it will be under a conſiderable preſſure in the veſſel, which is found conducive to the ſeparation of the tar, &c. When the gas comes over quickly from the retort, it preſſes upon the ſurface of the water, and cauſes it to aſcend through the pipe, *e*, in the partition into the upper chamber, where its weight conſtantly acts to cauſe a preſſure, and expel the gas at the pipe, *d*, whenever the ſupply of the retort diminiſhes; *f* is another pipe through the partition to allow the eſcape of the gas, if it forces out the water ſo low as the bottom of the pipe: the gas which then riſes into the upper diviſion gets away by the pipe *g* into the chimney of the funnel. Dr. Stancliffe has recently taken out a patent for the method of luting of the head and joint at G, as applied to the diſtillation of any other matter.

Fig. 5. is an apparatus by Mr. B. Cooke of Birmingham, recently communicated by him to the Society of Arts, and rewarded by them with a ſilver medal. The pipe A leads the gas from the pot or retort, and is fitted, in a manner ſimilar to Dr. Stancliffe's, to a veſſel B B, called the purifier. This is filled half full of water, and has five partitions, *a*, *a*, *a*, *a*, *a*, ſoldered to the lid, and extending beneath the ſurface of the water; at the lower edge a number of holes are pierced in the plates through which the gas iſſues, and riſes in bubbles through the water on the oppoſite ſide. In this manner it proceeds through all the plates, and is by that means waſhed and purified moſt perfectly, the cold water condenſing and depoſiting in the bottom of the veſſel the tar and ammoniacal liquor, which can be drawn off by the

cock *b*; M is the pipe which conveys the gas away from the end of the purifier, and leads it to the bottom of the tube, L L, of the gazometer, which is omitted in the drawing, as it is the ſame as in Mr. Clegg's apparatus, and furniſhed with balance weights in the ſame manner: N is the pipe to take the gas away to the burners. Mr. Cooke has placed his connecting pipes, M and N, inclined, and at the loweſt point a ſhort pipe *n*, which is immerſed in the water contained in a veſſel *m*, ſo as to prevent the eſcape of any gas, but at the ſame time to allow any tar, &c. to drain down the pipe and depoſit itſelf in the water. By this means the tar, which will unavoidably reſt in theſe pipes, is diſpoſed of without danger of clogging or ſtopping the paſſage, as might happen in courſe of years, though the quantity was ever ſo minute. Mr. Cooke recommends for dwelling-houſes, where the gas is required to be particularly free from ſmell, that it ſhould be paſſed through a ſecond purifier containing lime water, which will render it perfectly pure.

In any of theſe apparatuſes, it is eſſential that the water uſed for waſhing and purifying the gas ſhould be changed for freſh as ſoon as it becomes dirty; and unleſs this is done the gas will not be perfectly purified by waſhing, but retain an unpleaſant ſmell after it. The tar which depoſits itſelf at the bottom of the veſſel, in the conſiſtence of treacle or thick oil, is firſt drawn off by the cock: for that purpoſe this ſubſtance is found very uſeful, and in many points forms a ſubſtitute for the vegetable tar. By boiling it, the volatile parts are evaporated, and it becomes pitch. If the evaporation is performed in a retort, the matter which comes over is a ſpirit, which, according to Mr. Cooke, may be uſed inſtead of that kind of turpentine, known by the term tar ſpirit, in painting and japanning: and he gives particular directions for the manner of performing this diſtillation in the 28th vol. of the Tranſactions of the Society of Arts. The reſiduum left in the retort is pitch; or, if further boiled, makes aſphaltum, or a ſubſtance which is equally applicable, for the various arts in which it is employed.

It is proper that we ſhould here notice Mr. Winſor's proceſs for procuring gas, coak, and many other products, from pit-coal: but as this proceſs has not been wholly made public, our notice muſt be ſhort. A company has been eſtabliſhed for the purpoſe of carrying into execution his invention, and has applied to parliament for powers to act as a corporate body. Thoſe who form this body, propoſe to erect apparatuſes, in convenient ſituations, and convey the gas by pipes along the ſtreets of a town, for the purpoſe of lighting them, as well as the houſes. Experiments were made of this plan by lighting one ſide of Pall Mall, in London, which appeared to anſwer well; and the company's houſe has been conſtantly lighted and heated by gas ſince the firſt eſtabliſhment.

Mr. Winſor, at the opening of the buſineſs, gave lectures and experiments on the gas, though the manner of procuring and purifying it he kept a ſecret: he exhibited the mode of conducting it through the houſe, and a number of elegant devices for chandeliers, &c. by which it was conſumed. Among theſe he propoſed long flexible tubes ſuſpended from the ceiling of the room, and at the end communicating with a burner, which was deſigned with much taſte, being a cupid holding a torch in one hand, and graſping the tube, in the ſame manner, as a rope in the other. This figure was to be ſuſpended by hooks in any convenient part of the room where light was required, and might be carried into any cloſet or other place within the limits of the length of the tube. He ſhewed alſo by experiments, that the flame of the gas was not liable to be extinguiſhed by wind or rain, that it produced no ſmoke, and was not ſo dangerous as the light of lamps or candles, as it could not produce ſparks.

A pamphlet has been recently publiſhed by Mr. Van Voorſt, ſtating the evidence taken before the committee of the houſe of commons appointed upon the bill, for the incorporation of the Gas Light Company. This gentleman ſtates the products of a London chaldron of coals, treated in Mr. Winſor's proceſs, to be, 1ſt, light by the combuſtion of the gas equal to 2,100 pariſh lamps burning 11 hours: 2d, $1\frac{1}{2}$ chaldron of coak by admeaſurement: 3d, 60lbs. of pitch: 4th, three gallons of eſſential oil: and, 5th, 18 gallons of ammoniacal liquor; and he enters into a calculation of the pecuniary profits; but this we forbear to detail, as being entirely dependent upon the local ſituation and value of the coals and their products. This ſtatement is collected chiefly from the evidence of Mr. Accum. The bill was rejected by parliament; but we underſtand, by the above pamphlet, that the company intend to proſecute their undertaking without a charter of incorporation.

Mr. Murdoch made a communication in 1808 to the Royal Society on the ſubject of gas light, and was complimented with count Rumford's medal for the ſame. He gives the reſults of the proceſs as conducted in the cotton mills of Meſſrs. Phillips and Lee, at Mancheſter, who have a very large apparatus conſtructed by Mr. M. at the Soho works. The gas lights are equal to 2500 mould candles of ſix in the pound, each candle conſuming 175 grains of tallow per hour. The number of burners are 271 Argands, and 633 cockſpurs, ſo called from having three jets diverging from each other. Theſe require an hourly ſupply of 1250 cubic feet of gas to produce, which requires ſeven cwt. of cannel coal in the retort, and about one third of that quantity of good common coal to heat the retort. The cannel coal in the retort produces nearly $4\frac{1}{2}$ cwt. of good coak, and $4\frac{1}{4}$ ale gallons of tar. The ammoniacal liquor was not regarded, as it has not yet been applied to any manufacture, ſo as to be demanded in large quantities; though a paper by Mr. Wm. Cox will be found in Mr. Van Voorſt's pamphlet, ſhewing the advantages of the ammonia as applied for manure, and ſome other experiments on its uſe in dyeing. See FLAME.

GASBORN, in *Geography*, a town of Sweden, in the province of Warmeland; 43 miles N. of Carliſtadt.

GASCOIGN, or *Bezoardic Powder*, in *Medicine*, is formed of the compound powder of crab's claws one pound, of oriental bezoar prepared one ounce: this powder is made up into balls, called Gaſcoign balls, from the name of their inventor. This is omitted in the modern Pharmacopœias, as having no advantage over the prepared oyſter-ſhells.

GASCOIGNE, *Sir* WILLIAM, in *Biography*, who flouriſhed in the reign of Henry IV., was nobly deſcended of an ancient family in Yorkſhire. He was born at Gawthorp, near Leeds, about the year 1350; was a ſtudent in the law in the Inner Temple, and became a member of that ſociety. About the year 1398 he had attained to ſuch eminence in his profeſſion, that he was made one of the king's ſerjeants. From this period he was diſtinguiſhed for his ſound legal knowledge, and fidelity, in the tranſaction of the moſt intricate and important affairs, as well relating to his own rights as thoſe of the kingdom at large. How much he was employed on all great queſtions appears from the parliament rolls and other ancient records. From the firſt year of Henry IV., who began his reign in September 1399, to the latter end of it, we meet with the abſtracts of Gaſcoigne's opinions, arguments, diſtinctions, and deciſions, as well before he was chief juſtice as after, very frequently recited, among thoſe of other ſages of the law, in our old books of Reports, many of which are diſtinguiſhed and recommended, by the remarks of the editor, as worthy of obſervation, and may give good lights in our old law caſes. It appears,

pears that he was made lord chief juſtice of the king's bench ſo early as the year 1401. And in 1405 he was appointed with others, by the king, to treat with thoſe who had acted in rebellion againſt the exiſting government; and ſoon after, when archbiſhop Scrope and others were taken with arms in their hands againſt the king, his majeſty would have had his chief juſtice pronounce upon them ſentence of death without waiting the forms of trial, but Gaſcoigne maintained the law with ſo much integrity, that he refuſed to conform himſelf to the king's wiſhes, though by this refuſal he incurred his ſovereign's diſpleaſure. The anger of the king was but of ſhort duration, for we find that he preſented his judge with the honour of knighthood that ſame year. It was towards the latter end of this reign that the judge teſtified his regard to the law of the land, which ſhould bow to none, however high in rank, and in the prince and heir to the crown, Gaſcoigne gave an example which has been applauded by all writers from that time to the preſent. A riotous companion of the prince's had been indicted before the chief juſtice for ſome diſorders which had been committed, probably, either in the company of the prince or at his inſtigation. The young man appeared at the bar with the criminal, to give him countenance and protection, or to avert the due courſe of law. Finding that his preſence had not overawed the ſtern magiſtrate, he proceeded to inſult him in the diſcharge of his duty, but Gaſcoigne, regardleſs of every conſideration except that which the law of the land required, and recollecting that he was placed in that high ſtation to adminiſter juſtice, committed the prince himſelf to cuſtody, for his rude behaviour, there to wait his father's pleaſure; "but in ſuch venerable, ſuch coercive expreſſions; wherein the paternal authority of the king was ſo enforced by the awful gravity of the judge, that the prince's calm ſubmiſſion to the puniſhment was no leſs ſudden and ſurpriſing, than the outrageous offence had been which drew it upon him." An attempt was made by ſome of the courtiers to alienate the king's affections from the judge on account of his inflexible behaviour towards the heir apparent; but the monarch exclaimed, that he thanked his Maker, who had given him both a judge who could miniſter, and a ſon who could obey juſtice. The judge perſevered to the end of his life in the honeſt diſcharge of his official duties. He died in the year 1413, and a funeral was granted him proportionable to his eminent dignity and high fame. Upon his monument were his effigies at length. He is repreſented in his judge's robes, with his hood on, a large purſe faſtened to his girdle on his left ſide, and a long dagger on the right. Biog. Brit. Hume's Hiſt.

GASCONADE, a boaſt or vaunt of ſomething very improbable.

The term has its riſe from the Gaſcons, or people of Gaſcony, in France, who, it ſeems, have been diſtinguiſhed for bragging and rhodomontado.

Gasconade *River*, in *Geography*, a river of Louiſiana, which runs into the Miſſouri. N. lat. 38° 30'. W. long. 92° 20'.

GASCONY, Vasconia, in *Geography*, a province of France before the revolution, comprehending the ſouth diviſion of the government of Guienne, was bounded on the north by Guienne, on the eaſt by Languedoc, on the ſouth by the Pyrenées, and on the weſt by the ocean, and lay between 42° 35' and 44° 30' N. lat., and between 1° 40' W. long. and 1° 20' E. long., being 50 leagues from weſt to eaſt, and from 20 to 30 in breadth. This province derives its name from the Gaſcons, or Vaſcones, a tribe in Spain that deſcended from the Pyrenean mountains towards the concluſion of the ſixth century, and took poſſeſſion of Novempopulani. After their reduction by Theodebert, in 602, they revolted ſeveral times, but were finally ſubjected by Charlemagne. Theſe Gaſcons poſſeſſed a conſiderable degree of ſpirit; but they were ſo apt to exaggerate in deſcribing their exploits, as to render the term "Gaſconade" proverbial. Gaſcony is compoſed of the following diſtricts, *viz.* Armagnac in the centre; Bigorre, Soulz, and Labour on the ſouth; Chaloſſe and Landes on the weſt; Coudomois and Lomagne on the north; and on the ſouth Comminges and Couſerans. The principal rivers are the Adour, the Save, Gimone, Arrats, Gers, Baize, Loſſe, Neſte, and Gave.

GASCUENA, a town of Spain, in the province of New Caſtile; 30 miles N.W. of Cuença.

GASH, or Gaw, in *Mining*, is one of the numerous appellations for a fault or break of the ſtrata. See Fault.

GASHOLMA, in *Geography*, a ſmall iſland on the W. ſide of the gulf of Bothnia. N. lat. 61° 1'. E. long. 17° 5'.

Gasholma, *Oſter*, a ſmall iſland on the W. ſide of the gulf of Bothnia. N. lat. 61° 57'. E. long. 17° 20'.

Gasholma, *Weſter*, a ſmall iſland on the W. ſide of the gulf of Bothnia. N. lat. 61° 57'. E. long. 17° 17'.

GASIMA, a town of Japan, near the eaſt coaſt of Niphon; 45 miles N.E. of Jeddo.

GASKETS, on *Ship-board*, the ſmall cord uſed to faſten the ſails to the yards when furled up.

GASMAN, Floriano, in *Biography*, a German muſical compoſer of the Vienna ſchool, born in Bohemia, 1729. He diſtinguiſhed himſelf, not only in his own country, but in Italy, where he compoſed four ſerious operas and three comic, which had conſiderable ſucceſs; but no one ſo much as the comic opera, "L'Amore Artigiano," compoſed for Vienna, which, in 1770, when the Baglioni family from Bologna, conſiſting of ſix ſiſters, all ſingers, and Garibalde, were at Milan, had a very extraordinary run in that city, and afterwards was in very high favour all over Italy and throughout Europe, wherever there was an Italian lyric theatre.

In 1772 Gaſman was at Vienna, and had been appointed not only maeſtro di cappella to the emperor Joſeph II., but inſpector of the Imperial muſical library; honours to which his worth, genius, and talents well entitled him. This ingenious compoſer was ſometimes accuſed of want of fire in his theatrical compoſitions; but the gravity of his ſtyle is eaſily accounted for, by the time and pains he muſt have beſtowed on church muſic. To aim at equal perfection in both, is trying to ſerve God and Mammon; and thoſe excellent compoſers for the church, whoſe works have ſurvived them, ſuch as Paleſtrina, Tallis, Birde, Allegri, Benevoli, Colonna, Caldara, Marcello, Lotti, Perti, and Fux, have chiefly confined themſelves to the church ſtyle. Aleſſandro Scarlatti, Handel, Pergoleſi, and Jomelli, are exceptions. But, in general, thoſe ſucceed beſt in writing for the church, ſtage, or chamber, who accuſtom themſelves to that particular ſpecies of compoſition only.

We do not call every modern oratorio, maſs, or motet, church muſic; as the ſame compoſitions to different words would do equally well, indeed often better, for the ſtage. But by muſica di chieſa, properly ſo called, we mean grave and ſcientific compoſitions for voices only, of which the excellence conſiſts more in good harmony, learned modulation, and fugues upon ingenious and ſober ſubjects, than in light airs and turbulent accompaniments.

This author's works were very voluminous for a compoſer to whom longevity was not granted; for he died at Vienna in 1775, at only 45 years of age, after compoſing for the ſerious opera, in Italy, Merope, Iſſipile, Catone in Utica, Ezio, twice, and

Achille in Sciro: at Vienna, Olimpiade, Amore di Pſiche, and Il Trionfo d'Amore. For the comic opera, at Venice, l'Uccilatore, twice: il Filoſofo inamorato, un Pazzo ne fa Cento, and il Mondo nella Luna. At Vienna, i Viaggiatori ridicoli, l'Amore Artigiano, la Notte Critica, l'opera Seria, la Conteſſina, il Filoſofo inamorato a ſecond time, la Peſcatrice, and i Rovinati; beſides a great number of curious quartets, for various inſtruments, which we believe were never printed; but, having been favoured with MS. copies of them by the author himſelf, it is but juſtice to ſay, that, upon trial, we found them excellent: there are pleaſing melodies, free from caprice and affectation; ſound harmony, ingenious contrivances, and imitations, without the leaſt confuſion. The ſtyle is ſober and ſedate, without dulneſs, and maſterly without pedantry.

Theſe quartets, having been compoſed more than 30 years ago, are not ſo highly ſeaſoned as thoſe of Haydn and Mozart; but for thoſe who have not kept pace with the times, and are fond of plain food, they would perhaps be the more palatable.

GASMARK, in *Geography*, a town of Sweden, in the province of Warmeland; 30 miles E. of Philipſtal.

GASNITZ, a town of Bohemia, in the circle of Saatz; ſix miles E. of Eger.

GASPAR, in *Biography*, is the name of one of the moſt ancient contrapuntiſts of whoſe works any remains can be found. He is frequently mentioned by Franchinus among the moſt delightful compoſers of his time. He was contemporary with Juſquin; and among the maſſes and motets that were found printed under a patent granted by Leo X., preſerved in the Britiſh Muſeum, there is a maſs by Gaſpar, probably a native of France or Flanders. The compoſition of this maſs, which is upon the ſubject of an old ſong, *N'as tu Pas*, is excellent with reſpect to harmony; and the points of imitation are ſuch as would not diſgrace Paleſtrina, or even a much more modern author, as to melody, though printed in 1508, and probably compoſed in the preceding century. Though the names of Orpheus, Amphion, and Linus, have long ſurvived their works, we ſhall only record the names of muſicians, of whoſe abilities ſome ſpecimens are ſtill to be found.

GASPAR *Iſland*, or *Glaſſa*, in *Geography*, a ſmall iſland in the Eaſtern ſea, which gives name to a channel between the iſlands of Banca and Billiton, called "Gaſpar Straits." S. lat. 1° 55'. E. long. 107° 5'.

GASPARINI, FRANCESCO, in *Biography*, a native of Lucca, director of the Conſervatorio of La Pieta at Venice, Filarmonico at Bologna, and one of the greateſt maſters of his time.

His firſt publication was a book of twelve chamber cantatas, for a ſingle voice, ſmall 4to. Lucca, 1697. They are graceful, elegant, natural, and often pathetic; leſs learned and uncommon than thoſe of Aleſ. Scarlatti; but, for that reaſon, more generally pleaſing and open to the imitation and pillage of compoſers gifted with little invention.

In 1703, his uſeful little work, intitled "L'Armonico Pratico al Cembalo," firſt appeared at Venice, conſiſting of only 86 pages 4to. But by regular ſtudy and long experience, he knew what young muſical ſtudents chiefly wanted, and has ſupplied it in the ſhorteſt and cleareſt manner poſſible, in ſo ſmall a compaſs. He confines himſelf to accompaniment on keyed-inſtruments, a ſubject which had not been excluſively treated before in Italy, nor do we know of any elementary work that has appeared there ſince, of equal utility. It is divided into the following twelve chapters:

I. Names and poſition of the keys.
II. Method of forming harmony by concords.
III. Accidental characters.
IV. Method of accompanying the hexachord, in a gradual aſcent, and by leaps.
V. Method of accompanying the hexachord in a gradual deſcent, and in wider intervals.
VI. The harmony of all kinds of cadences.
VII. Of diſcords, their preparation and reſolution, and of binding notes and ſyncopation.
VIII. Method of acquiring the art of accompaniment in all keys, and modulating out of one key into another.
IX. Of licences in the harmony of recitatives. See ACCIACATURA.
X. Of breaking chords into groups, and of ornamenting and embelliſhing the harmony.
XI. Of dividing and flouriſhing the chords.
XII. Method of tranſpoſition, into every key, by means of imaginary clefs.

This little work, in 1764, had gone through five editions. But on the 4th edit. in 1754, M. Laborde (Eſſais ſur la Muſ. tom. iii. p. 544.) obſerves, that "it proves harmony to have made a very ſlow progreſs in Italy, &c. Gaſparini not being arrived at the règle de l'octave." But did the French themſelves, or any other people, follow that rule, or the fundamental baſe, when Gaſparini's book was publiſhed? And does the counterpoint of Durante, Jomelli, Galuppi, Piccini, or Sacchini, manifeſt a want of rules or knowledge of harmony?

In 1702, this elegant compoſer ſet the opera of "Tiberio" for Venice; and between that period, and 1723, he produced 25 operas for that city only, beſides a great number for Rome and other places.

He ſeems to have been the firſt opera compoſer who aimed at grace in his melodies, and who ſteered between the extremes of ſimplicity and pedantry.

When Quantz went to Rome in 1724, he found Gaſparini ſtill living, took leſſons of him in counterpoint, and his good nature and probity ſeem to have made as deep an impreſſion upon Quantz, as his muſical abilities.

He was at this time 72 years of age; and ſeems to have continued writing till he was near fourſcore: the laſt opera in Quadrio's liſt of his muſical dramas bearing date 1730.

He was the maſter of Domenico Scarlatti, and of Benedetto Marcello. A letter of his writing is printed in Marcello's Pſalms, in anſwer to one from his noble and illuſtrious pupil; and in the works of Metaſtaſio, there is a ſonnet by that exquiſite lyric poet on Gaſparini. When his "Merope" was performed at Rome in 1721, there was in it a ſcene of recitative which has been ſaid to draw tears from the whole audience.

During the reſidence of Aleſſandro Scarlatti at Naples, he had ſo high an opinion of Franceſco Gaſparini, then a compoſer and a harpſichord maſter of great eminence at Rome, that he placed his ſon Domenico, while a youth, to ſtudy under him in that city. This teſtimony of confidence in his probity and abilities gave birth to a ſingular correſpondence between theſe two great muſicians. Gaſparini compoſed a cantata in a curious and artful ſtyle, worthy the notice of ſuch a maſter, and ſent it as a preſent to Scarlatti: "Cantata inviata dal Signor Franceſco Gaſparini al Signor Aleſ. Scarlatti."

To this muſical epiſtle Scarlatti not only added an air, by way of poſtſcript, but replied by another cantata of a ſtill more ſubtile and artificial kind, making uſe of the ſame words: "Cantata in reſpoſta al Signor Gaſparini, del Sig. Aleſ. Scarlatti, Eumana." This reply produced a rejoinder from Gaſparini,

Gaſparini, who ſent Scarlatti another cantata, in which the modulation of the recitative is very learned and abſtruſe.

Scarlatti, ſeemingly determined to have the laſt word in this cantata correſpondence, ſent him a ſecond compoſition to the ſame words, in which the modulation is the moſt extraneous, and the notation the moſt equivocal and perplexing, perhaps that were ever committed to paper. This is entitled "Seconda Cantata del Signor Aleſ. Scarlatti in Idea Eumana, ma in regolo Cromatico, ed è per ogni profeſſore."

Franceſco Gaſparini's twelve cantatas, of which the ſecond edition was printed at Lucca 1697, were the firſt productions that he publiſhed. There is a movement in his ſecond cantata which would remind all who are acquainted with Dr. Pepuſch's celebrated cantata "Alexis," of the air "Charming ſounds that ſweetly languiſh."

GASPARINI, MICHAEL-ANGELO, a native likewiſe of Lucca, ſtudied under Lotti, was an eminent theatrical ſinger with a counter-tenor voice, and afterwards an excellent compoſer. His ſtyle of ſinging and good taſte acquired him great reputation.

He had many ſcholars as a ſinging-maſter, who became illuſtrious; among the reſt the celebrated Fauſtina. Having for a long time ſung the muſic of others, he, in turn, made others ſing his muſic, and compoſed many operas which pleaſed.

GASPARINO, BARZIZA, an Italian poet, was born, towards the cloſe of the 14th century, at Barziza, a place in the Bergamaſque, whence he derived his ſurname. He acquired, at an early period, a taſte for the good authors of antiquity, and taught others what he had learnt himſelf. He became a profeſſor of belles lettres at the univerſity of Pavia about the beginning of the 15th century, from whence he paſſed to Venice, and undertook the profeſſorſhip of moral philoſophy at Padua. About this period, by the death of his elder brother, in very ſtraightened circumſtances, he took upon himſelf the heavy charge of maintaining his eight children, which reduced him to ſuch a ſtate of indigence, that he was compelled to ſell his books. In 1418, he opened a public ſchool at Milan, by the order, and under the patronage of the duke, and his leiſure hours he employed in giving private inſtructions to young perſons, and in copying and correcting the MSS. of ancient authors. He died about the year 1431, leaving behind him ſeveral ſhort treatiſes on grammar and rhetoric; orations compoſed upon various occaſions; letters to his friends, which paſſed through ſeveral editions; and other epiſtles written by way of exerciſe as models to his pupils. His death was univerſally lamented by the city of Milan, and his merits and great learning were highly extolled by contemporary writers. Moreri.

GASPE BAY, in *Geography*, a bay on the eaſt coaſt of Lower Canada, and weſt ſide of the gulf of St. Lawrence.

GASPE, *Cape*, a cape on the coaſt of Canada, in the gulf of St. Lawrence, a little S. of Gaſpe bay; near which is an Indian ſettlement.

GASPEE, a diſtrict and county of Lower Canada, comprehending the point of land, bounded by the river and gulf of St. Lawrence on the north and eaſt, and the bay of Chaleur S. and S.W.

GASPEE, or *Namquil Point*, a point ſeven miles S. of Providence, Rhode iſland, projecting from the weſtern ſhore of Providence river; ſo called from the name of the Britiſh ſchooner Gaſpee, which was burnt June 10, 1772, by about 60 men from Providence, painted like Narraganſet Indians.

GASPESIA, a tract of country on the S. ſide of the mouth of St. Lawrence river, and on the N. ſide of Chaleur bay, in Lower Canada. Its eaſtern extremity is cape Roſiers. It is inhabited by Indians, called Gaſpeſians.

GASSAGO, a town of Italy, in the department of the Mela; 3 miles N.W. of Breſcia.

GASSEN, a town of Lower Luſatia; 15 miles S.E. of Guben.

GASSENDI, PETER, in *Biography*, a French philoſopher of diſtinguiſhed eminence, was born in 1592 at Chanterſier, near Digne, in Provence. At the early age of four years he manifeſted that pious diſpoſition and thoſe extraordinary talents, by the cultivation and exerciſe of which he acquired future celebrity. It was in this period of his infancy that he began to direct his attention to the heavens, and to avail himſelf by retirement of every favourable opportunity that occurred for contemplating them with ſatisfaction and advantage. His parents obſerved theſe dawnings of genius with delight, and though their circumſtances were moderate, they determined to give him the beſt education in their power. With this view, he was firſt placed under the inſtruction of an excellent maſter at Digne, where, by his proficiency in the Latin language, and in rhetorical exerciſes, he laid the foundation of the high degree of reputation to which he attained in early life. From Digne he was removed to Aix, where, for two years, he devoted himſelf to the ſtudy of philoſophy under an eminent profeſſor. At the age of 16 years he was appointed teacher of rhetoric at Digne; and at 19, profeſſor of philoſophy in the univerſity of Aix. Whilſt he neglected no opportunity that occurred of proſecuting his ſtudies in the learned languages, and alſo in mathematics and aſtronomy, he diligently examined the ancient ſyſtems of philoſophy, and adopted that of Epicurus, which he preferred to every other, and of which he approved himſelf afterwards a very ingenious and zealous advocate. Although the authority of Ariſtotle was acknowledged in all public ſchools, Gaſſendi, during the exerciſe of his profeſſorſhip at Aix, ventured publicly to expoſe the defects of his ſyſtem. The lectures which contained his cenſures of the Ariſtotelian philoſophy, delivered in the indirect form of paradoxical problems, were publiſhed under the title of "Exercitationes paradoxicæ adverſus Ariſtotelem." This work, which gave great offence to the partizans of Ariſtotle, was held in high eſtimation by ſeveral learned men, particularly by Nicolas Peireſc, the preſident of the univerſity of Aix; and induced him to uſe his intereſt for admitting the author to the degree of doctor of divinity, and to a canonry in the church of Digne. Having obtained theſe preferments, he reſigned his profeſſorſhip in Aix, and in his retirement at Digne purſued his philoſophical and aſtronomical reſearches. A ſecond volume was afterwards publiſhed, the object of which was to expoſe the futility of the Ariſtotelian logic. The author was diſcouraged from proſecuting the plan he had propoſed, and induced to deſiſt from all direct attacks upon the philoſophy of Ariſtotle, by the oppoſition of his bigotted and intolerant advocates; nevertheleſs he avowed his attachment to the ſyſtem of Epicurus, and then defended it with great ability and learning. Accordingly he undertook to frame from Lucretius, Laertius, and other ancient writers, a conſiſtent ſcheme of Epicurean doctrine, in which the phenomena of nature are immediately derived from primary atoms. But, aware of the fundamental defect of this ſyſtem, he added to it the doctrine of a ſuperintending deity, who firſt moved and ſubſequently arranged thoſe atoms, and whom he regarded as the wiſe governor of the world. The atomic doctrine was ſtrenuouſly maintained by Gaſſendi, in oppoſition to the fictions of the Carteſian philoſophy, which were then gaining ground; and he

he particularly aſſerted and vindicated the doctrine of a vacuum. On the ſubject of morals, Gaſſendi explained the permanent pleaſure or indolence of Epicurus, in a manner perfectly conſiſtent with the pureſt precepts of virtue.

In order to extend his acquaintance with learned perſons, Gaſſendi, in the year 1628, viſited Holland, where his philoſophical and literary merit was acknowledged and reſpected by many admirers and friends. During his abode in this country, he formed an intimacy with the learned Merſennus, and wrote an elegant and judicious apology for him in reply to the cenſures of Robert Fludd, on the ſubject of the Moſaic philoſophy. Upon his return to France, he renewed his application to aſtronomy, and proſecuted a ſeries of celeſtial obſervations, with a view of completing his ſyſtem of the heavens. At Paris he recommended himſelf, by his agreeable manners, as well as by his acknowledged reputation for literature and ſcience, to perſons moſt diſtinguiſhed for learning, and alſo for high rank, in that capital. By the intereſt of the cardinal of Lyons, the brother of cardinal Richelieu, he was appointed, in the year 1645, regius profeſſor of mathematics at Paris; an office, the primary duties of which he diſcharged by reading lectures on aſtronomy, which were attended by crowded auditories, and which, fully anſwering the high expectations that had been previouſly entertained, contributed to eſtabliſh and maintain his popularity. The fatigues of his public labours, added to his intenſe application in the proſecution of his private ſtudies, exhauſted the ſtrength of his conſtitution; and having caught a cold, which occaſioned an inflammation of his lungs, he was obliged, in the year 1647, to leave Paris, and to return to Digne, for the benefit of his native air. Having obtained ſome temporary relief by an intermiſſion of his ſtudies, he returned to Paris in the year 1653. Here he publiſhed the lives of Tycho Brahe, Copernicus, Purbach, and Regiomontanus; but reſuming his aſtronomical labours with his accuſtomed ardour, his diſorder returned, and he ſunk under it, in the year 1655, in the 63d year of his age. Juſt before he expired, he laid his hand upon his heart, and remarking the feeble ſtate of its pulſation, he ſaid to his attendant, "See, how frail is the life of man!"

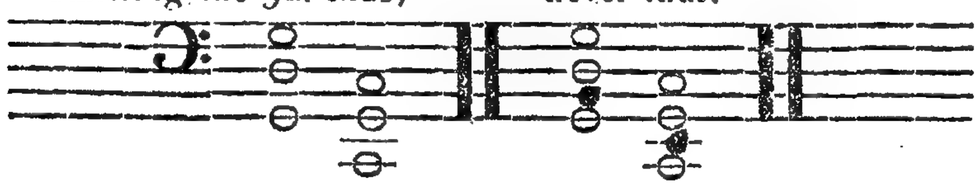
Gaſſendi was eminently diſtinguiſhed among his contemporaries by the ſoundneſs of his judgment, the extent of his reading, the capaciouſneſs of his memory, and the intenſeneſs of his application; and thus diſtinguiſhed, he attained to pre-eminence among the philoſophers of the period in which he lived. Our learned Barrow ranks him among the moſt eminent mathematicians of the age, and mentions him in connection with Galileo, Gilbert, and Des Cartes. His commentary upon the 10th book of Diogenes Laertius exhibits him to ſingular advantage, with regard to profound erudition and ſkill in the languages. By his oppoſition to the philoſophy of Des Cartes, already noticed, he formed a reſpectable party among the philoſophers of his time, denominated Gaſſendiſts, in contradiſtinction to the other prevalent party, known by the appellation of Carteſians. The latter were much more numerous than the former; for Gaſſendi had few diſciples in his own country; but among the Engliſh, who in his time were remarkable for their application to ſtudies of a phyſical and mathematical kind, a conſiderable number adopted his philoſophical ſyſtem. It is remarkable, that even thoſe eminent philoſophers and divines, ſuch as Whichot, Gale, Cudworth, and More, who entered the liſts with Hobbes, (whoſe doctrine came nearer to the principles of Gaſſendi than to the ſyſtem of Des Cartes), and revived ancient Platoniſm, in order to cruſh under its weight the philoſopher of Malmſbury, placed Gaſſendi and Plato in the ſame claſs, and explained the ſentiments of the latter in ſuch a manner, as to appear quite agreeable to the principles of the former. To this period many trace the origin of the two philoſophical ſects, called the *mathematical* and *metaphyſical*, which ſee. The controverſy between Gaſſendi and Des Cartes led to ſeveral mutual cenſures and reproaches on the part of their reſpective advocates. Whilſt Des Cartes and his metaphyſical followers were accuſed of ſtriking at the foundations of all religion, Gaſſendi is charged by Arnauld with overturning the doctrine of the ſoul's immortality in his controverſy with Des Cartes, and by Leibnitz with heſitating and wavering too much concerning the nature of the ſoul, and the principles of natural religion. The literary conteſt between theſe two philoſophers had betrayed them both into the uſe of ſome irritating expreſſions, which had produced a miſunderſtanding and coolneſs, that were much lamented by their friends; and attempts were made for effecting a reconciliation between them. The abbé d'Eſtrees, afterwards cardinal, took the lead in this laudable undertaking, and convened them, and ſeveral of their friends, among whom were father Merſenne, Roberval, the abbé de Marolles, and others, to a public dinner; Gaſſendi was prevented by illneſs from attending; but ſo intent was the abbé d'Eſtrees upon accompliſhing his purpoſe of reconciliation, that he took his gueſts with him to Gaſſendi's apartments; where they had the pleaſure of hearing theſe two philoſophers making mutual apologies for improper irritability, and declaring to each other, that whatever difference of opinion might after this interview ſubſiſt between them, it ſhould produce no interruption of their friendſhip. The firſt tranſit of mercury over the ſun, which had been predicted by Kepler to take place on the 7th of November, 1631, was obſerved by Gaſſendi. From his letters it appears, that he was on terms of intimacy with Kepler, Longomontanus, Snellius, Hevelius, Galileo, Kircher, Bullialdus, and other celebrated aſtronomers of that age, and that he was often conſulted by them; and his labours entitle him to a high rank among the founders of the reformed philoſophy. His large and valuable library, together with his aſtronomical and philoſophical apparatus, was purchaſed by the emperor Ferdinand III., and afterwards depoſited, with other choice collections, in the Imperial library at Vienna. The MSS. which he left behind him, and the treatiſes publiſhed by himſelf, were collected after his death, and, accompanied with the author's life, publiſhed by Sorbiere, in ſix volumes folio, in 1658. They conſiſt of the philoſophy and life of Epicurus; the author's own philoſophy; his aſtronomical works; the lives of Peireſc, Copernicus, Tycho Brahe, Purbach, Regiomontanus, John Muller, &c.; a refutation of the Meditations of Des Cartes; Epiſtles; and other treatiſes. Bernier, a celebrated French phyſician, has given an accurate view of the philoſophy of Gaſſendi in his abridgment of it, publiſhed in French at Lyons, in the year 1684, in eight volumes 12mo. This abridgment will give the reader a clearer account of this philoſophy than even the works of Gaſſendi himſelf, in which his meaning is often expreſſed in an ambiguous manner, and which are alſo loaded with ſuperfluous erudition. The life of Gaſſendi, accurately written by Bougerelle, a prieſt of the oratory, was publiſhed at Paris in 1737. Nouv. Dict. Hiſt. Brucker's Hiſt. of Philoſ. by Enfield, vol. ii. p. 464, &c. Moſheim Eccl. Hiſt. vol. v.

In the 5th vol. of his works, printed at Lyons in 1658, we find a tract on the theory of muſic: "Manuductio ad Theoriam Muſices." But this is confined merely to harmonics. He there demonſtrates, with Des Cartes and Père Merſenne, why the 4th, as a perfect concord, is more pleaſing in the acute than the grave. All theſe philoſophers, with

with the ancients, allow the 4th to be a concord, though, in counterpoint, the leaſt pleaſing of all. Des Cartes, the moſt ſevere of the ſcientific triumvirate, ſays, (Compend. Muſi. pag. 19. de Quarta) "Hæc infæliciſſima eſt conſonantiarum omnium, nec unquam in cantilenis attribuetur, niſi per accidens, et cum alterius adjumento, nec quidem quod magis imperfecta ſit quam tertia minor, aut ſexta, ſed quia tam vicina eſt quintæ, ut coram hujus ſuavitate tota illius gratia evaneſcat."

Organiſts have long obſerved that cloſe intervals in the baſe, though conſonant, are diſagreeable, and never, in full playing, give the 3d in a common chord with the left hand in the baſe.

omitting the 3d. thus, never thus.



GASSION, John de, a marſhal of France, was born in 1609 at Pau, where his father was preſident of the parliament. Being intended for the army, he, at the age of 16, entered into the gendarmes of the prince of Piedmont; and in 1627 he ſerved under the duke de Rohan in the civil wars with the Calviniſt party, to whom he was always attached. He next joined himſelf to Guſtavus, and was made captain of his body guard, and ſhortly after raiſed to the rank of a field officer in the cavalry, in which poſt he performed eſſential ſervices in ſeveral actions, eſpecially at the battle of Leipſic. Guſtavus was ſo highly pleaſed with his valour in the field and his fidelity in council, that he determined to diſtinguiſh him by ſome ſignal recompence; but the death of that great man at Lutzen prevented the execution of his well meant intention. (See Gustavus.) Gaſſion now returned to France with his regiment, and entered under the marſhal de la Force in Lorrain, where he performed many remarkable exploits, and where he became a terror of the enemy. At the ſiege of Thionville he received a dangerous wound, for which he was recompenſed in 1643 with a marſhal's ſtaff, and in the following year he was appointed lieutenant-general of the army in Flanders. He now performed the moſt brilliant actions, and was entruſted with highly important poſts, but when he had apparently attained to the height of his reputation, he received a mortal wound at the ſiege of Lens in 1647, and was buried in the pariſh church at Charenton. His hiſtory has been publiſhed by the abbè de Pure, in four volumes 12mo. He has been characteriſed as a military man by a daring courage and ſpirit of enterpriſe, which ſet at defiance all common obſtacles. "Theory," he ſaid, "was good in the cloſet, but boldneſs and action are the requiſites in the field." At another time he exclaimed, "I have that in my head and at my ſide which will overcome pretended impoſſibilities." Cardinal Richelieu had ſo full a confidence in him, that when urged by uncommon difficulties he uſed to ſay, "They will be readily removed by Gaſſion." Moreri.

GASSO, in *Geography*, a town of France, in the department of the Po; five miles S. of Chivaſſo.

GAST Hound. See *Gaze* Hound.

GASTALDUS, or Castaldus, an officer anciently entertained in the courts of divers princes.

The word is alſo written *gaſtaldius*, *gaſtaldio*, *gaſtaldatus*, *guaſtaldus*, &c. Macri derives it from the Arabic *chaſendar*, purveyor of a houſe; others from the German *gaſt*, and *halten*, to retain travellers.

The gaſtaldus was what in Italy and Spain is now called *major domo, viz.* the maſter and ſteward of a houſehold. The gaſtaldus was a comes, or count; which ſhews his office to have been very conſiderable.

In the laws of Italy, we ſometimes alſo meet with gaſtaldus in the ſenſe of a courtier, and ſometimes as an eccleſiaſtical officer; ſo that it is ſomewhere expreſſed to be ſimony to buy the function of gaſtaldus.

GASTALDY, John Baptist, in *Biography*, a doctor of the faculty of medicine at Avignon, and phyſician in ordinary to the king of France, was born at Siſteron, in 1674. He went while very young to Avignon, and finding that this city would afford him ample means of gratifying his taſte for ſtudy, he took up a permanent reſidence. He was an honour to the faculty, and filled the firſt chair of medicine for upwards of forty years; poſſeſſing the rare talent of uniting the uſeful with the agreeable, and, by this charm, attaching the ſtudent to his art. He devoted much of his time to practice, more particularly in the hoſpitals, and his value was acknowledged by the citizens of Avignon during the plague, which ravaged that place in the year 1720. Gaſtaldy died at Avignon in 1747. His principal work is the following; "Inſtitutiones Medicinæ Phyſico-Anatomicæ," 1713. Several Queſtions in Phyſic were publiſhed by him at different times reſpecting intereſting topics in phyſiology and medicine. Eloy. Dict. Hiſt.

GASTAUD, Francis, who flouriſhed in the beginning of the eighteenth century, was deſcended from a family of diſtinction, and born at Aix in Provence. Having received an education adapted to the purpoſe, he was at an early age admitted into orders, and officiated for ſome years as prieſt in the pariſh church of St. Paul. He was greatly admired as a preacher, and publiſhed ſeveral theological pieces, among which was "A Collection of Homilies on the Epiſtles to the Romans," in two volumes, 12mo. To this work is prefixed an excellent delineation of the character of St. Paul. On the death of his elder brother, a celebrated advocate in the parliament of Provence, he determined to embrace the ſame profeſſion. With this deſign he retired into the country, and applied moſt diligently to the ſtudy of the law. He then took his degrees, was admitted an advocate, and practiſed with uncommon ſucceſs. The intereſts of the poor he advocated without hope of reward; and in 1717 he gained a famous cauſe againſt the Jeſuits, of whom he was an active opponent. Not contented with pleading profeſſionally againſt them, he attacked them by means of the preſs, and wrote a bitter piece, entitled "The Jeſuits unmaſked." He publiſhed ſome treatiſes againſt the biſhop of Marſeilles, which occaſioned him to feel the ſevere vengeance of that prelate, at whoſe inſtance he was exiled twice to Viviers, where he died in the year 1731, and on account of his reputed hereſy he was denied the rights of Chriſtian burial. Moreri.

GASTE, St., in *Geography*, a town of the county of Tyrol; 20 miles S.W. of Bolzano.

GASTEIN, a town of the archbiſhopric of Salzburg, celebrated for its warm baths and mines of lead, iron, and gold; 36 miles S. of Salzburg.

GASTEL, a river of Wales, which runs into the Conway, in the county of Carnarvon.

GASTER, in *Anatomy*, (from the Greek γαστηρ), the *ſtomach*. In the ancient writers on medicine, the word is ſometimes applied to the abdomen in general, or to the uterus.

Gaster, in *Geography*, a bailiwick of Switzerland, belonging to the canton of Schweitz and Glaris, to which it was ſold by the houſe of Auſtria in 1438.

GASTE-

GASTEROSTEUS.

GASTEROSTEUS, in *Ichthyology*, a genus of the thoracic order, diſtinguiſhed by the following eſſential character; the head oblong and ſmooth; jaws armed with minute teeth; tongue ſhort and obtuſe; palate ſmooth; eyes moderate, ſlightly prominent, and lateral; gill-membrane with from three to ſeven rays; gill-cover of two pieces, rounded and ſtriated; body carinated each ſide, and covered with bony plates; dorſal fin ſingle, with diſtinct ſpines between it and the head; lateral line ſtraight; ventral fins behind the pectoral, and above the ſternum.

This is the Gmelinian character of the gaſteroſteus genus, and which, according to Lacepede, may be with propriety reduced to the following eſſential particulars; one dorſal fin with an armament of diſtinct dorſal ſpines placed before it; a longitudinal keel on each ſide the tail; one, two, or more rays in each thoracic fin, which are always ſpinous. The fiſhes of this genus are in general of a diminutive ſize, and, with the exception of four ſpecies, are peculiar to the ſeas and rivers of extra-European climates.

Species.

ACULEATUS. Three ſpines on the back. Linn. *Stickling*, *Stachelfiſch*, Wulff. *Three-ſpined ſtickleback*, Donov. Brit. Fiſhes.

The length of this ſpecies rarely exceeds three inches; the head is rather compreſſed, and the eyes remarkably prominent; the ſides covered with a ſeries of hard bony plates as in the other ſpecies of the ſame genus; near the tail the body is ſquare, and beneath the vent is a ſhort ſpine. The colour of the back green; ſides, and beneath ſilvery; and the chin, with the breaſt, and fore part of the abdomen of the female, of a fine red colour when in full roe. It inhabits freſh waters in dykes, ditches, and little rivulets, and occurs in ſuch vaſt abundance in many parts of Europe, that, notwithſtanding the diminutiveneſs of the ſize, it is employed very often as an article of manure. Gmelin relates that the ſtickleback is frequently uſed to fatten ducks and pigs; and it is well known that in the neighbourhood of Dantzic a kind of oil is expreſſed from it, which is in frequent uſe for burning in lamps and other ſimilar purpoſes.

DUCTOR. Dorſal ſpines four; gill-membrane with ſeven rays. Gmel.

Inhabits the ocean, and always preceedes, or appears in company, with the ſhark. The dorſal fin contains twenty-ſeven rays; pectoral eighteen; ventral ſix; anal ſixteen; and tail nineteen.

JAPONICUS. Dorſal ſpines four; gill-membrane with five rays. Gmel.

Length five inches, and of a yellow colour; the head obtuſe; jaws rough, without teeth; gill-covers not ſcaly, toothed behind; dorſal ſpines moveable, thick, ſtrong, unequal, and placed in a cavity; ventral fins connected by a thick rigid ſpine, an inch and a half in length; and the body covered with large rhombic ſcales, ending in ſpines turned backwards; the anterior part ciliated with ſpines, and the edge brown. Inhabits Japan.

In the dorſal fin are ten rays; pectoral twelve; anal nine, and tail twenty-two.

LYFAN. Dorſal ſpines ſeven; anal two; gill-membrane eight-rayed. Gmel.

An Arabian ſpecies; the body above blueiſh-brown, beneath white, and of an oblong lanceolate form. The lateral line undulated on the anterior part. The dorſal fin includes one ſpinous, and twenty-one ſoft rays; pectoral, ſeventeen rays; ventral, one ſpinous and ſix ſoft rays, and the anal, one ſpinous and nineteen ſoft rays.

OCCIDENTALIS. Dorſal ſpines ſeven; and two before the anal fin. Gmel.

Native of America; colour ſilvery; tail longitudinally ſtriated.

OVATUS. Dorſal ſpines ſeven, the firſt recumbent; anal two. Gmel.

A ſpecies of ambiguous character, allied in ſhape, according to Gmelin, to the genus Chætodon, and in other reſpects not ſufficiently diſtinguiſhed from the Labrus or the Scomber, with the firſt of which it accords, in being deſtitute of the thoracic plate, and with the other in its recumbent dorſal ſpine. The jaws and lips are rough; the dorſal ſpines directed alternately to the ſides, the firſt very ſmall, the next rather longer. This fiſh inhabits Aſia.

CAROLINUS. Dorſal ſpines eight; anal three. Gmel.

Native of the ſeas of Carolina, and greatly allied to the genus Scomber; the body is of an oval form, inclining to oblong; lateral line ſub-carinated at the tail; dorſal and anal fins falcated; and tail nearly bilobate.

CANADUS. Dorſal ſpines eight; anal none; gill-membrane ſeven-rayed. Gmel.

Body oblong; poſterior and anal fin falcate; tail nearly bilobate. Inhabits Carolina.

SALTATRIX. Dorſal ſpines eight, connected by a membrane; gill-membrane with ſeven rays. Gmel.

Native of the ſeas of Carolina, where, from its ſkipping frequently out of the water, it is known by the name of Skip-jack. The lower jaw has a ſingle row of teeth, the upper two; the dorſal ſpines are weak, and placed in a cavity; the tail forked.

PUNGITIUS. Dorſal ſpines about ten; and the ſides deſtitute of plates. *Spinis dorſalibus ſub-decem, lateribus abſque ſcutis*, Donov. *Gaſteroſteus pungitius; ſpinis dorſalibus decem*, Linn. *Centriſcus ſpinis decem, &c.* Klein. *Spinarella puſillus*, Bell. *La petite épinoche de mer*, Bloch. *Leſſer ſtickleback*, Will. *Ten-ſpined ſtickleback*, Penn.

The leſſer or ten-ſpined ſtickleback is the moſt diminutive of the fiſh tribe known, very rarely exceeding, when full grown, an inch and a half in length, and is even ſeldom found of that ſize.

This ſpecies is of a rather more ſlender ſhape than the common kind, and the jaws a little longer in proportion; the colour on the back olive; ſides yellowiſh, and parts beneath ſilvery. The number of the dorſal ſpines, which Linnæus and Gmelin admit as the principal diſtinction of the ſeveral ſpecies in this genus, we may venture to aſſert, ſo far as relates to the preſent ſpecies, at leaſt is not always conſtant. We have ſeen it with ten dorſal ſpines, as thoſe authors deſcribe; we have alſo ſeen it with only nine, and one example with no more than eight. Theſe circumſtances ſeem ſufficient to juſtify the ſlight amendment in the ſpecific character above propoſed, to which may be added, that the abſence of the lateral plates is very characteriſtic, and at once removes this from the other Britiſh ſpecies. The pectoral fin uſually contains about ten rays; the anal fin nine; and the tail twelve.

SPINACHIA. Dorſal ſpines fifteen. Linn. *Gaſteroſteus pentagonus*, Klein. *Aculeatus vel pungitius marinus longus*, Ray. *Grand épinoche*, Bloch. *Fifteen-ſpined ſtickleback*, Donov. Brit. Fiſhes.

Length from ſix to eight inches. The head of a remarkable tubular form; the body ſlender; back armed with fifteen ſharp ſpines, and the lateral line compoſed of ſmall, ſomewhat prominent, and pointed ſcales. General colour above olive, variable, and tinged with gold, beneath white. The dorſal fin contains about ſeven rays; pectoral fin ten rays; ventral an acute bony proceſs; in the anal fin are eight rays,

rays, the firſt of which is ſhort and ſpinous; and the tail contains twelve rays.

Inhabits the ſeas of Europe, and is rarely, if ever, found in freſh waters. The food of this ſpecies conſiſts of the fry of fiſhes and worms. It is taken in great plenty in ſome parts of Europe, not as an article of food, for it is ſeldom eaten; but, like the common freſh-water ſtickleback, for the purpoſe of manure, and alſo for the ſake of the oil, which it yields in abundance.

SPINARELLA. Spines on the poſterior part of the head four, ſomewhat ſerrated; the lateral ones as long as the belly. Gmel.

A native of India.

ACANTHIAS. Four ſmall rays before the dorſal fin; gill-membrane three-rayed. Gmel.

Inhabits the ſeas of Denmark.

GASTOLDI, ſometimes called *Gaſtaldi*, in *Biography*, a voluminous muſical Italian compoſer, born at Caravaggio, was author of thirty different works; the titles and dates of which may be ſeen in Draudius and Walther. Of theſe we have only ſeen his ballads, printed at Antwerp, 1596, under the following title: "Balletti a 5. co i verſi per cantare, ſonare, e ballare; con una Maſcherata de Cacciatori à 6. e un Concerto de' Paſtori, à 8." This puts the derivation of our word ballad out of all doubt, which originally meant a ſong that was ſung and danced at the ſame time. The tunes of Gaſtoldi are all very lively, and more graceful than any we have ſeen before the cultivation of melody for the ſtage. The firſt edition of theſe ballads was publiſhed at Venice, 1591; many of them are called *Fa las*, under which title our Morley, four years after, publiſhed ſhort airs, in five parts: ſo that it ſeems as if the name of *Fa la*, ſilly as it is, was not originally Engliſh.

GASTON DE FOIX, duke of Nemours, and nephew of Lewis XII. king of France, was born in 1488. The monarch took delight in the education of the youth, and at a proper period beſtowed upon him the government of Milan, and made him general of his army in Italy. The youthful hero was equally deſirous of ſhewing proofs of his valour, and ſignalized himſelf in various actions, the laſt of which was the battle of Ravenna, fought on Eaſter Sunday, 1512. Not contented with a ſignal victory he reſolved to follow the retreating army, and making a furious charge he was thrown from his horſe, and killed by an enemy's pike. His death, which happened in his 24th year, more than overbalanced the joy ariſing from the ſucceſs. Moreri.

GASTONIA, in *Botany*, ſo named by Commerſon and Juſſieu, in honour of Gaſton duke of Orleans, the ſecond ſon of Henry IV. of France. He was the patron of Moriſon, and founded the botanic garden at Blois, known to botaniſts by the name of *hortus bleſenſis*, of which Moriſon publiſhed a catalogue. This prince formed a plan for a general collection of drawings of plants, which was regularly continued after his death by the kings of France up to the revolution, and is ſtill we believe in a progreſſive ſtate, conſtituting one great ornament of the national library.—Juſſ. 217. Lamarck. Dict. v. 2. 610. Claſs and order, *Dodecandria Dodecagynia*. Nat. Ord. *Hederaceæ*, Linn. *Araliæ*, Juſſ.

Gen. Ch. *Cal.* Perianth ſuperior, of one leaf, ſhort, entire, ſlightly waved. *Cor.* Petals ſix, rarely but five, broad at the baſe, ſeſſile, ſomewhat triangular, keeled, acute, ſpreading, recurved at the point. *Stam.* Filaments twelve, rarely but ten, ſhort, awl-ſhaped; anthers ſhorter than the corolla, oblong, furrowed, of two lobes. *Piſt.* Germen ovate, furrowed; ſtyles ten or twelve, ſmall and ſhort; ſtigmas ſimple. *Peric.* Capſule? or berry? ovate, with ten or twelve furrows and as many cells, crowned with the permanent calyx. *Seeds* ſolitary.

Eſſ. Ch. Calyx of one leaf, ſuperior, entire. Petals ſix, broad at the baſe. Fruit of twelve cells. Seeds ſolitary.

This genus is akin to *Aralia*, as well as to Forſter's *Polyſcias*, Nov. Gen. t. 32, but differs widely from both in its calyx, as well as with reſpect to number in the parts of fructification. It was found by Commerſon on a large umbelliferous tree of the iſle de Bourbon, called in that country *bois d'eponge*, from its ſpongy bark, and hence Lamarck gives it the awkward ſpecific name of *cutiſpongia*. The *leaves* are pinnate, with a terminal leaflet often wanting; leaflets two or three inches long, ovate, wavy, entire, coriaceous, ſmooth. *Umbels* of about eight flowers, very numerous, in branched or umbellate cluſters, all naked. *Flowers* greeniſh, with yellow anthers, larger than in moſt umbelliferous plants, all equal and regular. Juſſieu ſays that on old trees they have five petals and fifteen ſtamens; on younger ones ten petals and ten ſtamens. We are indebted to him for a ſpecimen. Lamarck ſeems to have omitted this genus in his plates. This writer conſiders the *Nalugu*, Rheede Hort. Mal. v. 2. 43. t. 26, as another ſpecies, which Linnæus quotes for his *Aralia chinenſis*, and Juſſieu is diſpoſed to refer to *Aquilicia*, that is, *Leea*.

GASTORF, in *Geography*, a town of Bohemia, in the circle of Leitmeritz; 8 miles S.E. of Leitmeritz.

GASTOUNI, a town of European Turkey, in the Morea; 12 miles E. of Chiarenza.

GASTREL, FRANCIS, in *Biography*, was born at Slapton, in Northamptonſhire, about the year 1662. He was educated at Weſtminſter under the celebrated Dr. Buſby, where he was admitted a king's ſcholar, and afterwards elected ſtudent of Chriſt-church college, Oxford. This was in the year 1680; in 1684 and 1687 he took his degrees of B.A. and M.A., and in a ſhort time he was admitted to orders, and became diſtinguiſhed as a preacher. In 1694 he was appointed preacher to the honourable ſociety of Lincoln's Inn, London, and in 1697 he was appointed to preach the lecture founded by the Hon. Robert Boyle. The diſcourſes delivered on this occaſion he publiſhed in a continued treatiſe, entitled "The certainty and neceſſity of Religion, or the firſt Grounds and Principles of human Duty eſtabliſhed." In the year 1699 he publiſhed another diſcourſe as a ſecond part of the ſame important ſubject, entitled "The chriſtian Revelation, and the neceſſity of believing it eſtabliſhed, in oppoſition to all cavils and inſinuations of ſuch as pretend to allow natural religion and reject the Goſpel." In 1700 Mr. Gaſtrel took his degree of doctor in divinity, and was appointed chaplain to the houſe of commons. Two years afterwards he was preſented by the queen to a canonry of Chriſt-church in Oxford. About this time he engaged in the controverſy on the Trinity, and publiſhed "Some conſiderations concerning the Trinity, and the way of managing that controverſy," which was ſo well received that it quickly paſſed through two editions, and in the third he ſubjoined a vindication of it in reply to ſome animadverſions of Mr. Anthony Collins in his "Eſſay concerning the uſe of Reaſon." In 1707 he publiſhed "The Chriſtian Inſtitutes, &c. collected out of the writings of the Old and New Teſtament." In the year 1711 Dr. Gaſtrel was choſen proctor in convocation, for the chapter of Oxford, and was appointed one of the queen's chaplains. In 1714 he publiſhed his "Remarks upon Dr. Clarke's Scripture Doctrine of the Trinity," and in the ſame year he was promoted to the biſhopric of Cheſter, which occaſioned the reſignation of his office as preacher at Lincoln's Inn, though he was ſtill permitted to hold the canonry of Chriſt-church in commen-

dam. In politics Dr. Gaſtrel ſided with the Tories, which led to his promotion in the reign of queen Anne, but rendered him in ſome degree obnoxious to the adminiſtration in the following reign, whoſe meaſures he oppoſed in the houſe of lords. He ſhewed his zeal for the univerſity of Oxford in 1717, when it was attacked in the houſe of lords, upon account of a riot, or pretended riot, on the prince of Wales's birth-day. When the bill was depending againſt his old friend the biſhop of Rocheſter, he ſpoke with animation in his behalf, and with indignation againſt the adminiſtration. And in the year 1723, when the bill for inflicting pains and penalties on the biſhop had paſſed the commons, and was brought into the houſe of lords, Dr. Gaſtrel oppoſed it in every ſtage, becauſe he was convinced that there was not ſufficient evidence to juſtify the violence of the proceedings inſtituted againſt Dr. Atterbury. Dr. Gaſtrel fell a victim to the gout in the year 1725, when he was about ſixty-three years of age. He died at his apartments in Chriſt-church, and was buried in the cathedral there, without any monument. "But," ſays the writer of his life in the Biographia Britannica, "he left a ſufficient monument of himſelf in his excellent writings." Beſides his other employments, he was one of the commiſſioners for building fifty new churches in London: and a member of the Society for propagating the Goſpel in foreign Parts. Biog. Brit.

GASTRIC, in *Anatomy*, an adjective derived from γαστηρ, the ſtomach, and applied to the arteries, nerves, or other parts belonging to that organ.

GASTRICUS Succus, or *Gaſtric juice*, in *Phyſiology*, an animal fluid, ſecreted in the ſtomach, mixed with the food, which it has the power of diſſolving, and conſtituting thereby the chief agent in the proceſs of digeſtion. See Digestion.

GASTRILOQUUS, or Gastriloquous, a perſon who ſpeaks inwardly, or within his ſtomach, and whoſe voice ſeems to come from afar off; more uſually called *ventriloquus*, which ſee.

The term is formed of the Greek, γαστηρ, *belly, ſtomach*, and the Latin, *loqui, to ſpeak*.

GASTRITIS, in *Medicine*, from the Greek, γαστηρ, the *ſtomach*, with the termination *itis*, ſignifies inflammation of the ſtomach.

From the variety of ſubſtances which paſs through the ſtomach, and which may be injurious either by their quality or quantity, and from its great ſympathy with the reſt of the body, it might be expected that this organ would be particularly liable to be affected with inflammation. Such an affection, however, at leaſt in the acute form, generally underſtood by the appellation of gaſtritis, is a rare occurrence. But it has been obſerved by Dr. Cullen, that a leſs active degree, or rather a peculiar modification of the diſeaſe, which he has termed the *erythematic* inflammation of the ſtomach, occurs more frequently; although the ſymptoms, by which its preſence is indicated, are not always ſo unequivocal as thoſe of the acute or phlegmonous inflammation. The two forms of the diſeaſe have their ſeat, he conceived, in different parts of the ſtructure; the acute gaſtritis affecting the nervous coat of the ſtomach, or the peritoneum inveſting it; while the erythematous inflammation is always ſeated in the villous coat and cellular texture immediately ſubjacent.

The phlegmonic inflammation of the ſtomach, or gaſtritis properly ſo called, is characterized by an acute burning pain in the region of the ſtomach, which is ſuddenly increaſed, and vomiting at the ſame time excited by any thing whatever that is ſwallowed; it is alſo aggravated by external preſſure. Theſe ſymptoms are accompanied by a great degree of general fever or pyrexia; the pulſe is extremely quick and ſmall, and commonly hard. There is alſo extreme anxiety, and a greater depreſſion of ſtrength and loſs of power in all the functions of the body, than in the caſe of almoſt any other inflammation. In many inſtances there is a remarkable tendency to ſyncope; and there is frequent reaching, and often hiccup, independently of any thing ſwallowed. In ſome inſtances, other ſymptoms are ſuperadded to theſe. Thus very early in the diſeaſe, a high delirium has ſometimes come on, with great giddineſs and loſs of ſight, from the ſympathetic affection of the brain; conſiderable difficulty of breathing has alſo occurred, probably from the impoſſibility of depreſſing the diaphragm without compreſſing the ſtomach; convulſions of the muſcles, and in ſome caſes, although intenſe thirſt was preſent, an actual hydrophobia, or horror of taking liquids, has alſo taken place. By this term is to be underſtood, however, only a dread of drinking, and not the *rabies canina*, improperly called hydrophobia, from *one* of its ſymptoms. In a remarkable caſe of inflammation of the ſtomach, (deſcribed in the Edinburgh Medical Eſſays, vol. i. art. 29.) which was moſt violent, but ultimately cured by repeated blood-letting, this dread of liquids obviouſly aroſe from experience of the acute pain excited in the gullet and throat. "After this laſt blooding," ſays the writer, "the patient, finding himſelf more than ever relieved, called haſtily for a little warm milk and water, which he greedily glutted in a mouthful, and that very moment, with great force, ſpouted it at a great diſtance, and after it an incredible quantity of ſaliva in the ſame manner, telling, that notwithſtanding all his burning thirſt, to ſwallow it was impoſſible; nor could he, without a kind of horror, hear of any drink." Hence, it has been ſuppoſed, that the dread of water, connected with canine madneſs, originates from an inflammation of the gullet and ſtomach, more particularly as diſſection has often diſcovered a ſmall degree of ſuch inflammation in that diſeaſe. See Hydrophobia.

From the great ſenſibility of the ſtomach, and its ſympathetic connection with the other important organs of life, it muſt be obvious that inflammation of this viſcus, by whatever cauſes produced, muſt occaſion a great and often fatal derangement of the ſyſtem. In particular, by the great debility which ſuch an inflammation ſuddenly induces, it may quickly prove fatal, without running the common courſe of inflammations. Such indeed is the connection of the ſtomach with life, that ſome of the cauſes of gaſtritis produce death almoſt inſtantaneouſly, before any inflammation can be excited. Thus ſome of the narcotic poiſons, ſuch as laurel-water, a ſtrong infuſion of tobacco, or even ſpirituous liquors in ſufficient quantity, have produced immediate death; a large draught of cold water, after the body has been violently heated and exhauſted by great exertions and copious ſweating, has likewiſe had the ſame effect. (See Cold.) And a blow on the region of the ſtomach will occaſion inſtant death without producing either inflammation or rupture of veſſels; as in the caſe of a man taken to the Royal Infirmary at Edinburgh, and mentioned by Dr. Gregory in his lectures.

If the diſeaſe laſts long enough to follow the ordinary courſe of other inflammations, it may terminate like them by reſolution, gangrene, or ſuppuration. Some writers have mentioned ſcirrhus and cancer of the ſtomach as among the ſequelæ of gaſtritis; but Dr. Cullen has correctly ſtated that the ſcirrhoſities, which are often diſcovered affecting the ſtomach, are ſeldom known to be the conſequences of inflammation. The *prognoſis*, as to the tendency of the diſeaſe to one or other of theſe terminations, may be deduced from the following appearances and conſiderations. The diſpoſition of the inflammation to ceaſe, or to terminate by *reſolution*, as it is called, may be known by its having ariſen from

no violent cauſe, which may have injured the texture or ſubſtance of the ſtomach; by the mild or moderate ſtate of the ſymptoms; and by a gradual remiſſion of them, in conſequence of the action of the remedies employed in the courſe of the firſt few days of the diſeaſe. For in violent caſes, where the remedies have not been applied ſufficiently early or with ſufficient vigour, gangrene comes on very rapidly. The tendency to *gangrene* may be ſuſpected from the unyielding obſtinacy of the ſymptoms, when active remedies have been early employed, and eſpecially when the inflammation has been induced by corroſive poiſons, or draſtic emetics, taken into the ſtomach. And that a gangrene has already begun, may be known from the ſudden remiſſion or ceſſation of the pain, while the pulſe continues frequent, and at the ſame time becomes weaker; while other marks of the ſinking of the powers of life in the whole ſyſtem come on; ſuch as frequent fainting, ſtarting of the tendons, hiccup, a cadaverous appearance of the countenance, &c. *Suppuration* is a leſs frequent termination of gaſtritis, but occaſionally occurs, and may be expected to take place, when the ſymptoms have continued, in a moderate degree, for more than one or two weeks; and eſpecially when there is a conſiderable remiſſion of the pain, while a ſenſe of weight and anxiety ſtill remain. When an abſceſs is formed, the frequency of the pulſe is at firſt abated; but it ſoon again increaſes, and frequent cold ſhiverings, and marked exacerbations of heat and feveriſhneſs in the afternoon and evening, followed by night-ſweats, come on; in other words, a hectic fever enſues. At length the diſeaſe commonly proves fatal, unleſs the abſceſs open into the cavity of the ſtomach, the pus be diſcharged by vomiting, and the ulcer ſoon heal. There are, indeed, ſome rare inſtances on record, in which the impoſthume has burſt externally, and not only the pus, but the alimentary matters ſwallowed, have paſſed out at the opening during the remainder of life. In ſuch caſes, a previous adheſion of the ſtomach with the peritoneum had taken place by means of the inflammatory proceſs. Van Swieten mentions a woman of 60 years of age, whom he viſited, and who had ſuſtained ſuch a fiſtulous opening for 12 years, without any great injury to her health; "and I obſerved," he adds, "that the contents of the ſtomach came out in part through the opening of this fiſtula." (Comment. ad Aph. 955, Boerhaav.) He refers to a ſtill more extraordinary caſe, related in the Journal des Savans, for 1737, which occurred in a girl, in whom a ſuitable compreſs and bandage were required to cloſe the large opening of the fiſtula, otherwiſe all the nouriſhment that was taken in immediately flowed out through it. Nevertheleſs, the opening of this ulcer gradually contracted itſelf, and ſhe lived in ſuch good ſtrength as to undergo the labours in a country farm; in which manner ſhe ſupported her malady for the ſpace of 23 years.

Cauſes of Gaſtritis.—We are not acquainted with any particular *prediſpoſition* to gaſtritis in the firſt inſtance; but when the diſeaſe has once occurred, like moſt other inflammations, it leaves a tendency in the part affected to be more eaſily excited to inflammation again; and therefore, for a long time ſubſequent to recovery, the utmoſt caution, in regard to the uſe of irritating food and drink, is required. The *exciting* cauſes are ſuch matters applied to the ſtomach, as from their ſenſible, chemical, or mechanical properties, occaſion violent irritation to the ſtomach, or injure its texture: or the inflammation is produced by the extenſion of the diſeaſe from the neighbouring organs, or from diſtant parts by what has been termed *metaſtaſis*. Among the firſt of theſe, are, large draughts of cold liquids, taken while the body is greatly heated, the perſpiration is profuſe, and the exertions which occaſioned the heat have been remitted;—over-diſtenſion of the ſtomach with highly ſtimulant or indigeſtible food;—chemical acrids, whether poiſons, properly ſo called, or draſtic antimonial, mercurial, or cupreous emetics, taken into the ſtomach;—mechanical matters, which by their weight, roughneſs, &c. mechanically injure the coats of the ſtomach;—and in ſome caſes of peculiar debility of the ſtomach, even fermented liquors, or ordinary food. Among the laſt-mentioned cauſes are the inflammation of other viſcera, as of the liver, bowels, &c.;—the transference of gouty, rheumatic, or eryſipelatous inflammation, from the extremities;—and the checking of certain chronic eruptions on the ſkin. The ſtomach is alſo liable to be inflamed under an attack of general fever, like other organs of the body, by particular determinations of the circulation to the part. See FEVER.

Appearances on Diſſection.—When inflammation of the ſtomach induces death, independently of ſuppuration or gangrene (which are not the moſt frequent terminations of the diſeaſe), ſometimes the inflammation is found, upon diſſection, to have ſpread over a conſiderable part, or perhaps the whole, of the inner membrane; but moſt commonly it occupies a ſmaller portion. The ſtomach upon the outſide, at the inflamed part, ſhews a greater number of ſmall veſſels than uſual, but is commonly not much crowded with them. On opening the ſtomach, it is found to be a little thicker at the inflamed part, the inner membrane is very red from the number of ſmall florid veſſels, and there are frequently ſpots of extravaſated blood. When the exciting cauſe has been a corroſive poiſon, ſuch as arſenic, for inſtance, the inflammation is moſt intenſe. The ſubſtance of the ſtomach is then found thickened, and on opening into its cavity there is a very great degree of redneſs in the inner membrane, ariſing partly from the very great number of minute veſſels, and partly from extravaſated blood. Portions of the inner membrane are ſometimes deſtroyed, from the violent action that has taken place in conſequence of the immediate application of the poiſon: and ſometimes a thin layer of coagulable lymph is found thrown out upon a portion of the inner ſurface of the ſtomach. (See Baillie, Morbid Anat. p. 138.) It muſt be added, however, that from the diſſection of dead bodies it is known that the ſtomach has been often affected with inflammation when the characteriſtic ſymptoms, before mentioned, had not appeared: of this we ſhall have occaſion to ſpeak preſently.

Cure of Gaſtritis.—The treatment of inflammation of the ſtomach will neceſſarily vary according to the nature of the exciting cauſe, and to the degree and duration of the diſeaſe, and to the circumſtance of its being ſimple or complicated. The leading indication, however, and the general plan muſt be the ſame as in all phlegmonic inflammations, in their commencement, namely, to attempt the reſolution of the diſeaſe by depletion, together with the ſtrict obſervance of the antiphlogiſtic regimen. Large bleedings muſt be ſpeedily employed, and repeated, if the urgency of the ſymptoms continue to require it, notwithſtanding the ſmallneſs of the pulſe, the general debility, and even diſpoſition to fainting. For, after bleeding, it is obſerved that the pulſe commonly becomes fuller, and the tendency to ſyncope is diminiſhed. In the inſtance, recorded in the Edinburgh Medical Eſſays, to which we have already alluded, the patient was bled five times within ſeven hours, and was each time ſuddenly relieved from the acute pain; the pulſe, before irregular, became regular; and the cold extremities became warm. In delicate conſtitutions, when the violence of the inflammation has been reduced, but not altogether removed, by bleeding, the application of leeches, or of cupping-glaſſes, after ſcarifi-

cation, to the region of the ſtomach, may be occaſionally reſorted to with advantage. A large bliſter, applied to the pit of the ſtomach, after veneſection, is likewiſe advantageous. In caſes where a conſiderable irritability of the ſtomach, with little or no actual inflammation, exiſts, and gives riſe to naufea and vomiting, the external agency of a bliſter is often the moſt effectual remedy. The reſolution of the inflammation is alſo aſſiſted by fomentations to the whole of the abdomen, or by frequent emollient and laxative glyſters, which will contribute alſo to the purpoſe of dilution, and, from the vicinity of the colon to the ſtomach, may act as a ſort of internal fomentation.

It is fortunate that theſe meaſures, particularly the blood-letting and bliſtering, conſtitute the moſt effective means that we poſſeſs of reducing inflammatory action; for as, in this inflammation, every thing applied to the internal ſurface of the ſtomach itſelf is immediately rejected, and adds to the morbid irritation; no medicine can be adminiſtered by the mouth for its cure; and it is perhaps adviſable to abſtain altogether from taking any thing whatever into the ſtomach, whether by way of medicine or aliment, until the violence of the inflammation be ſomewhat ſubdued, however contrary ſuch abſtinence may be to the prejudices of Engliſhmen. An exception to this, however, lies in the caſe of gaſtritis, occaſioned by acrid or poiſonous ſubſtances; for here diluent liquids muſt be given, and the vomiting produced, by removing the irritating cauſe, may be ſerviceable; although it muſt be recollected that theſe acrid matters commonly produce a ſufficient degree of vomiting themſelves. In other caſes, where any thing can be borne by the ſtomach, liquids of the very mildeſt kind, ſuch as milk and water, thin gruel, &c. muſt be given, and in very ſmall quantities at a time.

For the acrid mineral poiſons, which act *chemically* on the living fibre, the uſe of antidotes or *correctors* naturally ſuggeſts itſelf. Thus the undiluted and corroſive acids and alkalies may be reciprocally neutralized by each other; the ſulphurets have been ſuppoſed to correct the acrid qualities of arſenical ſalts, &c. (See ARSENIC.) But it muſt be obſerved, with reſpect to the undiluted acids, and the pure or cauſtic alkalies, that their injurious operation on the texture of the parts with which they come in contact is inſtantaneous, and before any remedies can be applied, the whole miſchief is accompliſhed.

Opiates, in whatever manner exhibited, are very hurtful during the firſt days of inflammation of the ſtomach; but when its violence has greatly abated, or the pain and ſickneſs recur at intervals only, opiates may be cautiouſly adminiſtered in glyſters, and have ſometimes been thus employed with advantage.

The antiphlogiſtic regimen muſt be in a conſiderable degree adhered to, even after the diſeaſe is ſubdued: a low mild diet muſt be continued for ſome weeks; the food being ſparing alſo in quantity, conſiſting of milk and vegetables chiefly, and every thing hard, viſcid, inſoluble, or ſtimulant, together with all fermented liquors, being carefully avoided. We formerly mentioned, and the obſervation was ſupported by the authority of Dr. George Fordyce, that one of the moſt common cauſes of relapſe in fevers was the too ſpeedy recurrence to the ordinary full diet. (See FEVER.) This obſervation is ſtill more applicable to the *phlegmaſiæ*, or acute inflammations, and above all to inflammation of the ſtomach; becauſe inſoluble or ſtimulating ſubſtances not only operate by their influence on the general ſyſtem, but by their immediate contact with the organ, which is debilitated, and prediſpoſed to diſeaſe by the previous ſuffering.

When *ſuppuration* has actually begun, as Dr. Cullen juſtly remarks, it muſt be left to nature; our medicines are of no avail in influencing its progreſs, and the buſineſs of the phyſician is only to *avoid* all irritation. We can only confine the patient to quietneſs, and a mild diet. The caſe is then almoſt hopeleſs.

With reſpect to the *erythematic* inflammation of the ſtomach, it was conſidered by Dr. Cullen as a more frequent occurrence than that of the *phlegmonic* kind. We have already ſtated that diſſection has ſometimes detected the preſence of an inflamed condition of the ſtomach, when neither pain nor pyrexia had before given any notice of it. Such inflammation Dr. Cullen apprehends to have been chiefly of the erythematic kind. This ſpecies of inflammation, he thinks, would more frequently occur, from acrid matter of any kind taken into the ſtomach, were not the interior ſurface of this organ commonly defended by mucus, exuding in large quantity from the numerous follicles placed immediately under the villous coat. Upon many occaſions, however, the exudation of mucus is prevented, or the liquid poured out is of a leſs viſcid kind, ſo as to be leſs fitted to defend the ſubjacent nerves; and, in ſuch caſes, matters even of moderate acrimony may produce an erythematic affection of the ſtomach.

But although it ſometimes occurs where neither pyrexia, pain, nor vomiting indicate its preſence, there are caſes in which it may be diſcovered. The affection of the ſtomach ſometimes ſpreads into the œſophagus, and appears in the pharynx, as well as on the whole internal ſurface of the mouth. When, therefore, an erythematic inflammation affects the mouth and fauces, and when at the ſame time there ſhall be in the ſtomach an unuſual ſenſibility to all acrids, with a frequent vomiting, there can be little doubt of the ſtomach being affected with the ſame inflammation that has appeared in the fauces. Even when no inflammation appears in the throat, yet if ſome degree of pain be felt in the ſtomach, if there be a want of appetite, an anxiety, frequent vomiting, an unuſual ſenſibility with reſpect to acrids, ſome thirſt, and frequency of pulſe, there will then be room to ſuſpect an erythematic inflammation of the ſtomach; and Dr. Cullen affirms that he has known ſuch ſymptoms, after ſome time, diſcover their cauſe more clearly by the appearance of the inflammation in the fauces or mouth. Erythematic inflammation is often diſpoſed to ſpread from one place to another on the ſame ſurface; and, in doing ſo, to leave the place it had at firſt occupied. Thus, ſuch an inflammation has been known to ſpread ſucceſſively along the whole courſe of the alimentary canal, occaſioning in the inteſtines diarrhœa, and in the ſtomach vomitings; the diarrhœa ceaſing when the vomitings came on, or the vomitings upon the appearance of the diarrhœa.

When an erythematic inflammation of the ſtomach is diſcovered, it is to be treated differently according to the difference of its cauſes and ſymptoms. When it is owing to acrid matters taken in by the mouth, and when theſe may be ſuppoſed to be ſtill preſent in the ſtomach, they ſhould be waſhed out by throwing in a large quantity of warm and mild liquids, and exciting vomiting. At the ſame time, if the nature of the acrimony and its proper corrector be known, this ſhould be thrown in; or if a ſpecific corrector be not known, ſome general demulcents ſhould be employed, in order to inviſcate the acrid matter, or to defend the ſurface of the ſtomach from its irritation. Theſe meaſures, however, are more ſuitable to prevent the inflammation than to cure it after it has taken place. When it has occurred, and is attended with a ſenſe of heat, with pain and fever, the modes of depletion, bliſtering, and fomentations, mentioned when

ſpeaking

ſpeaking of the phlegmonic gaſtritis, muſt be more or leſs employed according to the degree of thoſe ſymptoms. When an erythematic inflammation of the ſtomach has ariſen from internal cauſes, if pain and pyrexia accompany the diſeaſe, ſome bleeding, in perſons not otherwiſe weakened, may be employed; but as the affection often ariſes in what are called putrid diſeaſes, and in convaleſcents from fever; ſo in theſe caſes bleeding is inadmiſſible: all that can be done being to avoid irritation, and to throw into the ſtomach what quantity of acids, and of aceſcent aliments, it ſhall be found to bear. In ſome conditions of the body, in which this diſeaſe ariſes, the Peruvian bark and bitters may ſeem to be indicated; but an erythematic ſtate of the ſtomach does not commonly allow of them. See Cullen, Firſt Lines, chap. viii. Van Swieten Comment. Sauvages.

GASTROBRANCHUS Cœcus, in *Ichthyology*, is a curious fiſh, that has been erroneouſly ranked by Linnæus among the *Vermes*, under the name of Myxine *glutinoſa*. Its uſual length is from four to ſix or ſeven inches, and its general appearance is that of a ſmall eel; the mouth is ſituated beneath, as in the lamprey, and is of an oblong form, bearded on each ſide, and furniſhed with a ſeries of teeth, diſpoſed on each ſide into a double row, in form of a pectinated bone. This animal is deſtitute of eyes. The accurate examination of its ſtructure by Dr. Bloch has proved it to belong to the tribe of cartilaginous fiſhes: the ſkin is ſmooth, and deſtitute of ſcales, and the animal is of an uncommonly glutinous nature. It is not unfrequently found about the Britiſh coaſts, and is ſaid to deſtroy other fiſhes by piercing their ſkin, and ſucking their juices, and even devouring all the internal parts.

GASTROCELE, (derived from γαστηρ, *the ſtomach*, and κηλη, *a tumor*,) a hernia, or rupture containing the ſtomach. See Hernia.

GASTROCNEMIUS, in *Anatomy*, from γαστηρ, the *belly*, and κνημη, the *leg*, is a muſcle of the leg, occupying the ſurface of the calf. The three muſcles compoſing the calf are ſo connected to each other, that they ought to be deſcribed together; moreover, their office is the ſame. We ſhall include them under this article. The gaſtrocnemius, which ariſes from the femur, and the ſoleus, originating from the tibia and fibula, are both connected to a common tendon, which projects at the lower and back part of the leg, and is inſerted into the back of the heel. This is called tendo Achillis, as being the part by which Thetis is ſaid to have held her ſon, when ſhe dipped him in the Styx.

The *gaſtrocnemius*, (called alſo gemellus, gaſtroc. externus, and bi-femoro-calcanien,) forms with the ſoleus the extenſor tarſi ſuralis or magnus of Douglas. It conſiſts of two portions, very much reſembling each other, ſeparate above, and uniting below in a common aponeuroſis, placed at the back of the leg, and extending from the femoral condyles to the poſterior ſurface of the os calcis. The internal head of the muſcle is larger than the external, flattened, and broader below than above. Its poſterior ſurface is covered above by the ſemi-membranoſus, and in the reſt of its extent by the faſcia of the leg. The anterior ſurface covers the knee joint, the attachment of the ſemi-membranoſus, the popliteal artery, the popliteus muſcle, the plantaris, and the ſoleus. Its inner edge is unattached: the outer is ſeparated from the external head at its upper half, and united with it by the lower. The upper extremity, which is thick and ſomewhat rounded, is attached juſt above the back part of the internal condyle. From this point it deſcends and paſſes with a ſlight obliquity from within outwards, ſoon joining the external head. Its breadth increaſes gradually to about the middle of the calf, and then diminiſhes again, ending in a broad aponeuroſis. The internal head is covered behind by the aponeuroſis of the leg: it covers in front the capſule of the knee, the popliteus and ſoleus. The outer margin is unattached, while the inner is ſeparated from the oppoſite above, and confuſed with it below. Its upper extremity is attached juſt above the back of the external condyle. It deſcends at firſt rather obliquely from without inwards, grows broader firſt, then again narrower, and ends in the ſame apeneuroſis as the former head. Both theſe portions of muſcle terminate below the middle of the leg in a broad and flat tendon, which grows narrower as it deſcends. This is attached to the poſterior ſurface of the ſoleus ſooner on the outer than on the inner ſide, and is very intimately connected to that muſcle.

The two heads above deſcribed are tendinous and muſcular. The internal is fixed to the former by a broad and thick tendon, intimately connected in front to the capſule of the knee, deſcending firſt on the inner edge, and then expanding into a broad ſheet, which covers more than the upper half of the poſterior ſurface. The tendon of the outer head is not ſo thick as that of the preceding. After deſcending for two inches on the outer edge, it expands on the back of the muſcle, like the former. The common aponeuroſis, in which the two heads terminate, increaſes very much in breadth as it aſcends, and covers the anterior ſurface almoſt as high as the upper extremities. The fleſhy fibres of the inner head ariſe from the outer edge and anterior ſurface of its upper tendon, and terminate on the back of the common aponeuroſis. Thoſe of the outer paſs, in like manner, from the inner edge and front of the upper tendon to the back of the common expanſion, but are not mixed with thoſe of the oppoſite head.

The *plantaris*, extenſor tarſi minor of Douglas, jambier grêle, petit femoro-calcanien, is a very long but ſlender muſcle, placed between the gaſtrocnemius and ſoleus, and not exiſting in all ſubjects. It extends from the back of the outer femoral condyle, to the poſterior and inner part of the os calcis. Its poſterior ſurface is covered by the gaſtrocnemius; it covers in front the capſule of the knee, the popliteus, the popliteal artery, and the ſoleus. Its upper extremity is fixed to the upper and back part of the external condyle of the femur, to the capſule of the knee, and to the tendon of the outer head of the gaſtrocnemius. It deſcends obliquely from without inwards, and, after a courſe of three inches and a half, forms a very narrow flat tendon, which continues between the gaſtrocnemius and ſoleus, until the lower fourth part of the leg, when it eſcapes. It is then connected to the inner edge of the tendo Achillis, and deſcends with that tendon, being ſtill more intimately united to it below, where it is implanted in the upper, inner, and back part of the os calcis.

The ſoleus, gaſtrocnemius internus, le ſoleaire, tibio-peronei-calcanien, is placed at the back of the leg, and extends from the upper extremity of the fibula to the poſterior portion of the os calcis. It is broad and thick, and nearly oval, and preſents to our conſideration an anterior and poſterior ſurface, an inner and outer edge, an upper and lower extremity. The poſterior ſurface is covered by the gaſtrocnemius and plantaris, and below the former by the faſcia of the leg: the front ſurface covers the peroneus longus, the upper third part of the back of the fibula, to which it is attached, the popliteus, flexor longus digitorum pedis, flexor longus pollicis pedis, and tibialis poſticus, the popliteal, poſterior tibial, and peroneal arteries, and the poſterior tibial nerve. The inner margin is ſeparated above from the popliteus by an interval, in which the popliteal artery and accompanying nerve paſs: it is then fixed to the oblique line at the upper and back part of the tibia, and to the inner

margin of the bone, half way down the leg. In the reſt of its extent it is unattached. The external margin is unconnected throughout, and offers nothing worthy of remark. The upper extremity of the muſcle is thin and narrow, and fixed to the upper and back part of the fibula. From this point it deſcends along the back of the leg, growing broader to the middle of the limb, and then contracting again to the inferior extremity, which is fixed to the lower and back part of the os calcis.

The ſtructure of the ſoleus is tendinous, aponeurotic, and fleſhy. Its attachment to the os calcis is by means of a very powerful tendon, named tendo Achillis, which is fixed to the lower half of the poſterior ſurface of the bone. The anterior ſurface of the tendon is in contact with the upper half of the back ſurface of the bone, which is covered by a layer of cartilage. A thin ſynovial membrane expanded over the oppoſed ſurfaces renders them ſmooth, and confines the ſynovia, by which they are lubricated. As the tendon aſcends from the heel, it is at firſt contracted ſlightly in its breadth, ſo as to aſſume nearly a cylindrical figure: it then grows broader, and divides into two aponeuroſes, a ſmaller belonging, as we have already deſcribed, to the gaſtrocnemius, a much more conſiderable one to the ſoleus. The latter grows broader as it aſcends, and expands ſo as to cover the whole poſterior ſurface of the muſcle, excepting the upper extremity.

From its anterior ſurface, near the outer margin, there ariſes an aponeurotic ſeptum, which aſcends among the muſcular fibres, and approaches gradually to the middle of the muſcle. Two other aponeuroſes, an internal and an external one, may be obſerved towards the upper part of the front of the ſoleus. The firſt ariſes from the oblique line at the back of the tibia, and from its inner edge, and deſcends on the inner ſide of the front of the muſcle below its middle. The latter proceeds from the upper extremity and outer margin of the fibula, and deſcends low on the outer part of the muſcle. From its upper and inner edge a portion is detached, to form an aponeurotic inverted arch, covering the paſſage of the popliteal veſſels and nerve behind, and continues on the oppoſite ſide with the internal aponeuroſis. From the two aponeuroſes juſt deſcribed the muſcular fibres ariſe, and paſs obliquely to the anterior ſurface of that which covers the back of the muſcles, and to the ſides of the aponeurotic ſeptum, which exiſts in the ſubſtance of the muſcle. They deſcend along the interior ſurface of the tendo Achillis, to within three inches of its attachment to the os calcis.

Action of theſe Muſcles.—The muſcles of the calf are particularly employed in progreſſion; and their bulk and power, with thoſe of the gluteal muſcles, prove that the human ſubject was deſigned to walk erect. Hence man is particularly characterized by the largeneſs of his calf, and no animal equals him in this reſpect. In the attitude of ſtanding, when the foot reſts firmly on the ground, the ſoleus, having its fixed point in the heel, keeps the leg backwards, and prevents it from obeying the tendency, which the weight of the body gives it, to bend forwards on the foot. When the leg has been carried forward on the foot, the latter part being fixed to the ground, this muſcle will reſtore it to its erect poſition, by moving it backwards on the foot. The gaſtrocnemius fixes the thigh behind, as the ſoleus does the leg; and oppoſes the cruralis and vaſti which hold the bone in front. When their action is carried beyond the degree now deſcribed, the gaſtrocnemius may bend the thigh backwards, or the ſoleus the leg.

By lifting the heels, when the body is erect, the muſcles of the calves elevate the whole body, which is ſupported on the two aſtragali; the weight is there maintained by the anterior part of the feet, and the individual is ſaid to ſtand on tiptoes. If the foot of one ſide be lifted from the ground, and the oppoſite heel be raiſed by the calf of its own ſide, the whole body is then elevated by the muſcles of one calf. When a perſon ſtands on tiptoe with a burden on the ſhoulders, or any other part of the trunk, the weight of this, as well as of the body, muſt be elevated and ſupported by the muſcles of the calf.

In progreſſion, the ſoleus and gaſtrocnemius, by lifting the heel, make the foot deſcribe a ſemicircle, the point reſting on the ground, and the heel being elevated. This motion increaſes the length of the lower extremity by the whole length of the foot, and gives an impulſe to the trunk, which propels it forwards. See the article EXTREMITIES for a further account of the mechaniſm of this motion. Running puts theſe muſcles in powerful action: the front of the foot only reſts on the ground at each ſtep, the back portion being kept conſtantly elevated. Their action is equally obſerved in leaping, at the inſtant when the heel quits the ground. We may obſerve here that theſe muſcles of the lower limbs, which, by their ſudden contraction, ſtrengthen the previouſly bent articulations, are by far the moſt powerful. This may be ſeen in the ſoleus, with reſpect to the ankle, in the vaſti and cruralis, to the knee, and in the gluteus maximus, to the hip. The height to which the hip is ſometimes elevated in leaping is aſtoniſhing. The fact is explained by the power of theſe muſcles, diſpoſed firſt behind, then in front, and then behind again, to accord with the alternate directions in which the joints are bent. The vaſt force exerted by the muſcles of the calf, in raiſing the body in jumping or dancing, accounts alſo for the rupture of the tendo Achillis. The unfavourable manner in which the muſcles act in elevating the body, when we aſcend an eminence, explains the weight and fatigue experienced at thoſe times in the calf of the leg. The gaſtrocnemius may aſſiſt the flexors of the knee in bending the leg on the thigh.

The plantaris, from its diminutive ſize, can have but little ſhare in the movements juſt deſcribed: it muſt produce juſt the ſame effect as the gaſtrocnemius. As it is frequently abſent, its office cannot be very important.

GASTROCOLICA VENA, (from γαστηρ, the *ſtomach*, and κολον, the *colon*,) a vein, which pours its blood into the vena portarum. See VEIN.

GASTRO-COLICUM OMENTUM, is the ſame as the great omentum. See EPIPLOON.

GASTRODIA, in *Botany*, (γαστροειδης, having a ſwelling, or ventricoſe, form; in alluſion to the ſhape of the flower, which in this family is ſingular.)—Brown Prod. Nov. Holl. v. i. 330.—Claſs and order, *Gynandria Monandria*. Nat. Ord. *Orchideæ*.

Gen. Ch. *Cal.* Perianth ſuperior, coloured, of one leaf, tubular; the orifice in five ſhort, oblique, rather unequal lobes, all directed toward one ſide. *Cor.* Petals none. Nectary encloſed in the calyx, lying on the organs of impregnation, ſupported by a claw, unconnected. *Stam.* Anther terminal, moveable, deciduous, its cells cloſe together; maſſes of pollen of large angular particles, cohering elaſtically. *Piſt.* Germen inferior, pear-ſhaped, nearly globular, ribbed; ſtyle columnar, elongated, but ſhorter than the calyx, excavated at the top, thickened at the baſe in the fore-part, where the ſtigma is ſituated. *Peric.* Capſule nearly globular. *Seeds* numerous?

Eſſ. Ch. Calyx of one leaf, tubular, five-cleft. Lip ſtalked, unconnected. Anther vertical.

1. G. *ſeſamoides*. Native of Port Jackſon, where, according to Mr. R. Brown, it is very rare, he having never ſeen more than ſix or ſeven ſpecimens. We received one from

from Dr. White many years ago, whoſe flowers we cannot afford for diſſection, and therefore have borrowed the above account of their internal parts from our accurate friend Mr. Brown. The *roo* is paraſitical on thoſe of other plants, fleſhy, branched, and jointed. *Stalk* ſimple, erect, a foot high, ſmooth, leafleſs, bearing two diſtant, ſhort, abrupt, entire, membranous ſheaths. *Cluſter* terminal, ſimple, of ſix or ſeven drooping, pale bluſh-coloured flowers, reſembling thoſe of *Seſamum orientale*, but ſmaller, and highly remarkable in their natural order for having a tubular calyx of one leaf, which in fact combines what we have taken for calyx and corolla in other *Orchideæ*. See CYMBIDIUM, DENDROBIUM, EPIDENDRUM, EPIPACTIS, &c. Linnæus would have termed it a petal, Swartz a calyx. This plant has moſt affinity with *Satyrium Epipogium* of Linnæus, referred by Swartz to *Limodorum*. See EPIPOGUM. S.

GASTRODYNIA, in *Medicine*, from γαστὴρ, the *ſtomach*, and ὀδύνη, *pain*, is a term applied by the noſologiſts to thoſe varieties of pain in the ſtomach, which ariſe independently of inflammation in that organ. See GASTRITIS.

Hoffmann, and ſome other writers, expreſs the ſame idea by the word *Cardialgia*; while Sauvages and Cullen employ both the terms, making an arbitrary diſtinction in their acceptation of them. Sauvages diſtinguiſhes cardialgia from gaſtrodynia, by applying the former to pain or uneaſy ſenſation about the region of the ſtomach, which is accompanied by a tendency to ſyncope, or fainting; and uſing the latter to denote a more acute pain of that region, without any ſuch concomitant diſpoſition. But the diſtinction of Dr. Cullen, who reſtricted the term cardialgia to what is popularly underſtood by the word *heart-burn*, is more generally adopted. "For thoſe pains that are either acute or pungent, or accompanied with a ſenſe of diſtention, or of conſtriction, if they are at the ſame time not attended with any ſenſe of acrimony or heat, I employ the appellation of *gaſtrodynia*. To expreſs thoſe painful or uneaſy ſenſations which ſeem to ariſe from a ſenſe of acrimony irritating the part, or from ſuch a ſenſe of heat as the application of acrids, whether externally or internally applied, often gives, I employ the term of *cardialgia*; and by this I particularly mean to denote thoſe feelings which are expreſſed by the term *heart-burn* in the Engliſh language." (See Cullen, Firſt Lines, § 1427. Sauvages, Noſol. Meth. Claſs vii. Gen. 20 & 21. Hoffmann, Medicina Rat. tom. ii. § ii. cap. 2.) The Engliſh terms cramp in the ſtomach, ſtomach-colic, &c. are ſynonymous with gaſtrodynia, which alſo includes thoſe more obtuſe and chronic pains, which accompany the organic derangements of the apertures of that viſcus, or of its coats. The word *colic*, however, which ſtrictly denotes a painful affection of the *colon*, or great inteſtine, has been improperly transferred to pain, connected with the other abdominal organs.

Pain in the ſtomach is occaſioned by a variety of matters taken into it, and by various morbid conditions of its coats; ſo that Dr. Cullen, conſidering it as a mere ſymptom, has not allowed gaſtrodynia a place in his noſological arrangement. It is more eſpecially mentioned by him as one of the numerous ſymptoms which indicate a debilitated condition of the digeſtive power of the ſtomach, or *dyſpepſia*; in which caſe it is accompanied by other indications of the ſame debility, as by a diſcharge of wind, a ſenſe of weight and fullneſs after meals, belching, nauſea, foul tongue, &c. (See INDIGESTION.) The pain, under ſuch circumſtances, is excited ſometimes by over-diſtention of the fibres of the ſtomach by flatulence, (Gaſtrodynia *flatulenta* of Sauvages,) or by irregular ſpaſmodic contraction of ſome portion of the organ, (G. *ſpaſmodica*,) as occurs in the bowels in colic; or by the preſence of an overload of undigeſted aliment, (G. *ſaburralis*); or of worms; or of bile, or other acrimonious ſecretion, (G. *verminoſa* and *bilioſa* of the ſame author.)

It has been well obſerved by Dr. Pemberton, in his "Practical Treatiſe on various Diſeaſes of the abdominal Viſcera," that the pain in the ſtomach, connected with this dyſpeptic ſtate of it, is moſt felt, in ſome caſes, when the ſtomach is empty; and in others, when the ſtomach is full. This conſideration, that the pain is mitigated or removed by the application of food in the one inſtance, and by the withholding it in the other, leads us to infer a difference in the proximate cauſe of the pain, and in the nature of the remedies neceſſary to cure it, in the two caſes. "That pain," Dr. Pemberton remarks, "which is moſt felt when the ſtomach is empty, ſeems to ariſe from an altered and increaſed ſecretion of the glands of the mucous membrane of that organ. This fluid, by its acrimony (if I may be allowed the expreſſion) irritates the nerves of the ſtomach, and thus cauſes pain. When it is ſecreted in ſmall quantities, it may be ſo enveloped by any food that is taken, as to render it inert; or when it is ſecreted in larger quantities, it may be thrown up, after cauſing violent pain, by vomiting: and in this ſtate it conſtitutes what is called *pyroſis*, or *water braſh*." (Loc. cit. p. 101.)

"The pain of the ſtomach, which is moſt felt when it is full, would appear to ariſe from irritability of the muſcular coat of that organ, and not to be at all connected with the glandular ſecretions of it; for unleſs the pain be called forth by food being received, it will reſt perfectly at eaſe. The food will remain down perhaps half an hour (or more) before any uneaſy ſenſations are created. Theſe then will go on increaſing till the food is returned again, very little changed from the operation of digeſtion. This diſeaſe is attended with ſympathetic head-ache; it ſeems particularly to attack chlorotic women, and hypochondriacal men; I am therefore inclined to believe that it owes its origin to the muſcular fibres of the ſtomach, partaking of the general irritability of all other muſcular parts in an irritable habit; and I think that the advantage derived from the method of treatment hereafter mentioned, will add conſiderable ſtrength to this opinion." (P. 115.)

The following *diagnoſtic* ſymptoms, by which this form of gaſtrodynia may be diſcriminated from the pain ariſing from organic diſeaſes of the ſtomach, are ſtated by the author juſt quoted. It may be diſtinguiſhed from that pain which is produced in a ſtricture of the *cardia*, or upper orifice of the ſtomach, by the pain not being perceived *the inſtant* the food is ſwallowed, by the ſeat of the pain not being confined to one ſpot, and by there having exiſted conſtitutional derangement *previous* to the ſtomach affection; whereas, in ſtricture of the cardia, the conſtitution is *ſubſequently* affected. It may be diſtinguiſhed from *ſcirrhus* or *cancer* of the ſtomach, by the pain not being produced, except after taking food; whereas, in either of the former caſes, there is more or leſs of conſtant pain; and in cancer, what is brought up from the ſtomach is uſually very offenſive, and is alſo more or leſs of a dark brown hue.

Among the exciting cauſes of pain in the ſtomach, the ſwallowing of poiſonous and indigeſtible ſubſtances, which, by their chemical or mechanical properties, injure the texture, and irritate the nerves of the ſtomach, muſt not be omitted. Theſe occaſion the gaſtrodynia *à veneno*, and G. *à peregrinis* of Sauvages. Not only the more active and corroſive ſubſtances, denominated poiſons, ſuch as arſenic, mercurial, antimonial, and other metallic ſalts, the undiluted mineral acids, &c. operate in this way; but even the draſtic drugs given for the purpoſe of exciting an emetic or cathar-

tic

tic action, ſometimes produce a conſiderable degree of gaſtrodynia, when imprudently adminiſtered in an over-doſe. (See Hoffmann, loc. cit.) There are many examples on record of various ſubſtances, altogether foreign to the uſe of man, being ſwallowed with impunity; ſuch as pieces of money, pins, needles, glaſs, ſhells, the ſtones of fruit, &c. but there are alſo numerous inſtances, in which the moſt diſtreſſing gaſtrodynia, ultimately terminating fatally, has been the conſequence. One of the moſt extraordinary inſtances of the original impunity, but ultimate fatality of ſuch a practice, lately occurred in Guy's Hoſpital, in the perſon of an American ſailor; who, between the years 1799 and 1805, had ſwallowed upwards of *thirty claſp-knives*, which cauſed his death in March 1809, after a long ſeries of ſuffering. (See Annual Med. Regiſter for 1808, vol. i. p. 380.)

Pain in the ſtomach is often connected with certain ſtates of the gout, with hyſteria, and with hypochondriaſis, and therefore to be treated by the remedies which are requiſite for the removal of thoſe diſeaſes reſpectively.

The Cure of Gaſtrodynia muſt neceſſarily be as various as the cauſes which give riſe to it; and theſe will require an accurate inveſtigation, by attending to the other ſymptoms of diſorder with which it may be accompanied, before we attempt the adminiſtration of remedies. When the ſigns of impaired digeſtion, already mentioned, concur with the pain, if it is known that any ſubſtance of difficult digeſtibility has been ſwallowed, or that any exceſs of eating has been committed, it may be convenient to rid the ſtomach of part of its over-load, by means of an emetic or a gentle cathartic; a practice, indeed, which is often indicated by the efforts of the conſtitution to relieve itſelf by a ſpontaneous vomiting or diarrhœa: in this caſe theſe efforts only require to be aided by diluent, tepid drinks, or glyſters. Afterwards the ſtrength of the ſtomach may be reſtored by the uſe of the vegetable bitters, or other tonic medicines, together with regular exerciſe, and the plan adapted to the cure of *indigeſtion* (which ſee). When there is much flatulence, the exhibition of thoſe cordial ſtimulants, which have been called carminatives, will afford relief to the pain ariſing from over-diſtention, and aid the general plan. The aromatic vegetable matters, the diſtilled waters from dill, coriander, pepper-mint, and plants of ſimilar property, ſmall doſes of æther, &c. may be employed for this purpoſe. When the pain occurs in violent and ſudden paroxyſms, the ſpaſms may be relieved by any active ſtimulant, ſuch as the æthers, cordial tinctures, wines, preparations of opium, the internal and external application of heat, by means of warm drinks, fomentations, or by a dry heat externally applied to the region of the ſtomach. In caſes where there is a frequent eructation of an acid fluid, or even of the taſteleſs fluid, which conſtitutes the water-braſh, alkaline medicines are frequently of conſiderable benefit. Sometimes alſo the generation of acid in the ſtomach is prevented by an oppoſite method of treatment, namely, by the uſe of the mineral acids, which put a ſtop to the acetous fermentation out of the body. With theſe means of obtaining temporary relief, thoſe remedies which ſtrengthen the digeſtive powers, as above mentioned, muſt be alternated or combined.

For that pain which is moſt felt when the ſtomach is empty, and which Dr. Pemberton conſiders as ariſing from an altered ſtate of the glandular ſecretions of its internal coat, he conſiders the combination of opium with aſtringents as the moſt effectual remedy; and he prefers the form of pill as affording the moſt permanent application of the medicine. In the incipient ſtages he employs pills of opium and kino, or of opium and alum. When the ſecretion of the fluid appears to be moderated, the tone of the ſtomach may be reſtored by a chalybeate water, or by ſteel in ſome other form. The diet, Dr. Pemberton adds, ſhould be plain-dreſſed animal food, with a ſmall proportion of vegetables. The patient ſhould be particularly cautious not to take a large quantity of bread. He ſhould moreover abſtain entirely from fermented liquors, as he ſhould from hot broths, fiſh, and in ſome caſes from eggs.

In that pain of the ſtomach, which ariſes when the ſtomach is full, and which is conſidered as a local diſeaſe, in conſequence of conſtitutional derangement, the method of treatment muſt be, for the moſt part, conſtitutional, regard being paid at the ſame time to the ſtomach itſelf: and Dr. Pemberton conſiders the green draught of myrrh, ſoda, and ſulphate of iron, or Griffith's mixture, as comprehending every ingredient which will meet this intention. Should it happen that the pain in the ſtomach is extremely violent, a ſmall doſe of an opiate may be taken half an hour before dinner, or added to each doſe of the mixture above mentioned. A combination of opium with the carbonate of ammonia, taken in the ſame way, has ſometimes appeared to be very efficacious.

A remedy was ſome time ago recommended by Dr. Odier, of Geneva, for the cure of that form of gaſtrodynia which is ſpaſmodic, and connected with an increaſed irritability of the ſtomach; namely, the white oxyd of biſmuth, or, as it is called in the ſhops, where it is chiefly ſold as a coſmetic, the magiſtery of biſmuth. Dr. Odier employed this remedy "in doſes of ſix grains, four times a day, in all caſes of ſpaſms of the ſtomach, brought on by any kind of aliment, and proceeding only from the irritability of that organ." (See a paper by Dr. Marcet, in the Memoirs of the Med. Soc. of London, vol. vi. p. 155.) We have ſeen a few ſtriking inſtances of the efficacy of the biſmuth in certain forms of gaſtrodynia; but in others, in which no obſervable difference in the circumſtances could be detected, it has appeared to be altogether inert. It may be given in much larger doſes, than thoſe above mentioned; we have ſeen a ſcruple taken three times a day with impunity, or rather without any effect whatever. The common magiſtery, ſold for coſmetic purpoſes, is often an impure oxyd, mixed with nickel, cobalt, or other ſubſtances.

When gaſtrodynia is occaſioned by the preſence of poiſons or other extraneous matter in the ſtomach, we muſt endeavour by evacuant medicines to diſcharge them, or by means of diluents or chemical agents, to weaken the operation of the poiſonous ſubſtances, or farther to defend the ſtomach in ſome degree againſt the irritation of both, by means of mucilaginous and oleaginous medicines. See Poison.

GASTRO-EPIPLOIC, in *Anatomy*, (from γαστηρ, the *ſtomach*, and επιπλοον, the *omentum*,) a name given to certain arteries and veins, which are diſtributed to both theſe organs. See Artery and Vein.

GASTRO-HEPATICUM Omentum. See Epiploon.

GASTROLATER, of γαστηρ, and λαλγευω, *a glutton*, or *belly-god; cujus deus venter eſt.*

GASTROMANCY, or Gastromantia, a kind of divination, practiſed among the ancients, by means of words coming, or ſeeming to come, out of the belly.

The word is Greek, γαστρομαντεια, compoſed of γαστηρ, *belly*, and μαντεια, *divination*.

There is another kind of divination, called by the ſame name gaſtromancy, which is performed by means of glaſſes, or other round, tranſparent veſſels, within which certain figures

figures appear by magic art. It is thus called, becauſe the figures appear as in the belly of the veſſels.

GASTROPODA, in *Zoology*, a ſub-order in the claſs of *Molluſca*. See CLASSIFICATION of *Animals*.

GASTRORA'PHE, or GASTRORA'PHIA, a term, in *Surgery*, derived from γαστηρ, the *belly*, and ῥαφη, a *ſuture*, or *ſeam*. It means the ſewing up of a wound of the abdomen, or inteſtines; a proceeding, which is hardly ever deemed neceſſary, or proper, by the moſt eminent modern ſurgeons.

With reſpect to ſewing up a wound of the parietes of the abdomen, ſurgical writers inform us, that either the common interrupted ſuture may be uſed, (ſee SUTURE,) or the quilled one, which is generally repreſented as that to which a preference ought to be given. The quilled ſuture is practiſed on the abdomen, as follows; a ligature, capable of ſplitting into two, is to have a needle faſtened to each end of it. The operator is to put the index finger of his left hand into the wound, under the lip, which is furtheſt from him. This finger is placed in contact with the peritoneum, in order that it may, with the aſſiſtance of the thumb, pinch up and raiſe the whole thickneſs of the parietes. With the right hand, one of the needles is to be introduced into the abdomen, its point being guided on the index finger, ſo as to be kept from wounding the omentum and inteſtines. We are directed to pierce the lip of the wound, from within outward, about an inch from its edge. The other needle is to be paſſed in the ſame way through the oppoſite lip. Then the two needles are to be cut off. As many ſuch ſutures muſt be made as the extent of the wound may require. The ſides of the wound are next to be brought together, and we are to prepare to tie the ligatures, not in a bow, in the way of the interrupted ſuture, becauſe, it is ſaid, the continual action of the abdominal muſcles might make the ligatures cut their way through the parts. Hence we are directed to ſplit each end of the ligatures into two portions, and to tie theſe over a piece of bougie, laid along the line, at which the ligatures emerge from the fleſh. This is to be done to all the ligatures on one ſide firſt. Then, the wound being cloſed, another piece of bougie is to be placed, in a ſimilar manner, along the other lip of the wound; and the oppoſite ends of the ligatures are to be tied over it, with ſufficient tightneſs to keep the ſides of the wound in contact.

Although we cannot allow, that this ſuture is proper in ordinary wounds of the abdomen, we believe that it is preferable to the interrupted one, becauſe a great deal of its preſſure is made on the two pieces of bougie, and, of courſe, the ligatures muſt be leſs likely to cut their way out. Its operation is to be aſſiſted with the uniting bandage, or ſtrips of adheſive plaſter, and with compreſſes laid over each ſide of the wound, under the bandage. Every thing ſhould be avoided which tends to put the abdominal muſcles into action, by which means the ſuture would be dragged, the wound irritated, and a riſk created of the threads cutting their way through the fleſh. In order to prevent, as much as poſſible, all exertion of the abdominal muſcles, the bowels ſhould be kept open with glyſters; and no medicine is ſo good as opium for putting a ſtop to the vomiting, which is ſometimes attendant on wounds of the abdomen, and apt to produce a very hurtful diſturbance of the wound.

The quilled ſuture receives its name from the circumſtance of a quill having been formerly uſed inſtead of a piece of bougie. The ligatures may generally be withdrawn in about a week, and ſticking-plaſter uſed with only common dreſſings.

Gaſtroráphe, in the ſenſe of ſewing up a wound of the external parts of the abdomen, muſt generally be regarded as a highly unneceſſary proceeding, unproductive of any good, and likely to occaſion a great deal of avoidable irritation and pain. It has now been proved, by repeated and manifold experience, that all ordinary wounds of the belly may be united by means of common dreſſings, a proper poſture, and ſome kind of bandage. There is an excellent paper ſhewing the ill effects of ſutures, by M. Pibrac, in the Mémoires de l'Academie de Chirurgie, tom. 3. This gentleman has adduced many intereſting caſes, where extenſive wounds of the belly were cured in the moſt favourable manner, without the aid of ſutures. The large wound, made in the Cæſarean operation, has alſo been often healed, as well as poſſible, without ſewing the parts together. We feel it unneceſſary, however, to ſay more at preſent on the general impropriety of ſutures, as we ſhall have occaſion to reſume the conſideration of it hereafter. See SUTURE.

We can juſt conceive a caſe in which it might be found abſolutely neceſſary to uſe a ſuture. For inſtance, were an extenſive tranſverſe wound to be made through the parietes of the abdomen, this plan might be the only means capable of preventing an actual protruſion of ſome of the viſcera. Yet, even in this circumſtance, the ſtitches ſhould be as few as the ſtate of things will allow. With reſpect to longitudinal wounds, the uniting bandage, with ſtrips of adheſive plaſter, is fully ſufficient to keep their lips in contact.

Gaſtroráphe, in the ſenſe of ſewing up ſome breach in the inteſtinal canal, is now never practiſed by the moſt eminent ſurgeons. We mean the reader to underſtand, that a ſuture is never employed with a view of holding the edges of an inteſtinal wound together, though it may be deemed expedient, in certain caſes, to faſten a thread to a wounded inteſtine, by which means the injured bowel may be retained near the external wound, ſo as to enable any extravaſated matter to find its way out. See WOUNDS.

The old writers, who ſaid a great deal about gaſtroráphe, ſeem rather to have done ſo from cuſtom than reaſon. What they meant by the term could hardly ever be practiſed; becauſe the ſymptoms laid down for diſtinguiſhing when an inteſtine is wounded do not, with any certainty, determine in what particular part it is wounded, which want of information makes it abſurd to open the abdomen to get at the injured part. Hence, in former times, when ſewing together living parts was leſs horrid, the operation of ſtitching the bowels could hardly have been done, by the moſt raſh practitioner, except when they were both wounded and protruded. At preſent, even in this uncommon caſe, a good ſurgeon would not proceed to ſew up the breach, as an old woman mends a hole in a glove. At moſt, he would only faſten a thread to the wounded part before returning it into the belly. Gaſtroráphe, in ſhort, was always more talked of than executed; and Du Verney, who was for many years the moſt eminent ſurgeon in the French army, during ſeveral campaigns, and who, moreover, lived at a period when the faſhion of fighting with ſwords commonly prevailed, acknowledged, that he had never met with a caſe which required the performance of gaſtroráphe, that is, the operation of ſtitching the bowels. It has alſo been propoſed to ſew the ends of the inteſtinal canal together, in inſtances of mortified herniæ. However, there are ſtrong objections to ſuch practice, as will be hereafter explained. See HERNIA.

GASTROTOMIA. A term, ſignifying the operation of cutting into the abdomen. The word is derived from γαστηρ, the *belly*, and τεμνω, to *cut*. It often denotes the Cæſarean operation, or that of cutting into the uterus in order to extract the fœtus.

GASULON, in the *Materia Medica*, a word uſed by Avicenna and Serapion, to expreſs ſometimes the plant hyſſop, and ſometimes nitre. Theſe are two very different things to be known under the ſame name; but the proper interpretation of the word being the *cleaning of clothes*, it was uſed probably at ſome time to ſignify every thing of an abſterſive quality; but among the many things of this kind once called by it, the two above mentioned are all that we find recorded, which may be eaſily diſtinguiſhed by the context.

GATA, in *Geography*, a town of Spain, in the province of Eſtramadura, on a river of the ſame name, which riſes near the town, and runs into the Alagon, 15 miles S.W. of Coria. The town is 15 miles N.N.W. of Coria.

GATA, *Cape*, or *Cape de Gat*, a promontory of Spain, on the coaſt of Grenada, conſiſting of an enormous rock of a ſingular nature and appearance, 24 miles in circuit, and 13 broad. In the centre of this promontory are four hills, near each other, called the Sacriſtan, the Two Friars, the Captain, and the White Mountain. The other ſide of the promontory, beyond theſe four hills, is called "El Puerto de la Plata," where the Mooriſh corſairs lie lurking for Spaniſh veſſels. N. lat. 36° 43'. W. long. 2° 22'.

GATAKER, THOMAS, in *Biography*, was born in London in 1574. Having attained a good ſtock of grammar learning, he was, at the age of 16, ſent to St. John's college, Cambridge, where he greatly diſtinguiſhed himſelf, as well for his indefatigable diligence, as for the modeſty of his manners and the excellence of his diſpoſition. He had the misfortune to loſe his father in a ſhort time after he had been at college, and was by this circumſtance left without the means neceſſary to continue him at the univerſity. Some benevolent and zealous friends contributed to his ſupport, and he was thus enabled to complete his ſtudies. In due time he took his degrees, and was, on account of the general eſtimation in which he was held, appointed one of the fellows of Sidney college, even before the inſtitution was erected; but in the year 1599, when the college was finiſhed, he entered upon his duties as tutor with great reputation and ſucceſs. While he was engaged in this employment he formed a plan, with others, of preaching at the neighbouring villages. After a reſidence of ſome months, Mr. Gataker quitted the univerſity with a determination to ſettle in London. He firſt engaged as chaplain to ſir William Cooke, a ſituation which proved the means of his introduction to many perſons of eminence and learning, particularly in the profeſſion of the law; this led to the honourable poſt of preacher to the ſociety of Lincoln's-inn, the duties of which he diſcharged with great reputation for ten years. By the acceptance of this office Mr. Gataker did not diſſolve his connection with ſir William Cooke's family, though in termtime he thought it his duty to reſide in Lincoln's-inn. In 1603 he took his degree of bachelor of divinity at Cambridge, and might have proceeded to that of doctor, but declined it for economical reaſons. The reputation which he acquired by his diſcourſes at Lincoln's-inn chapel occaſioned ſeveral inſtances of valuable preferments to be offered to him, which he might have held without relinquiſhing his ſituation of preacher to that ſociety. But he felt it was not right for any man to hold offices, the duties of which he could not perform, and therefore he ſet his face againſt all pluralities. It was his wiſh alſo to continue as he was, becauſe his preſent ſituation, though the income of it was ſmall, afforded him leiſure to purſue his learned ſtudies. To theſe he devoted much of his time, particularly to the ſtudy of the Scriptures in their original languages. In 1611 Mr. Gataker entered the matrimonial ſtate, and accepted the rectory of Rotherhithe. He now applied himſelf with all diligence to the duties of the paſtoral office. In 1616 Mr. Gataker maintained a correſpondence with archbiſhop Uſher on ſome literary ſubjects. Several of the letters which paſſed between them are preſerved in the collection ſubjoined to the life of the archbiſhop, which afford abundant evidence of the great knowledge and critical acumen of Gataker, and of the high eſteem in which he was held by that learned prelate. While Mr. Gataker was preacher at Lincoln's-inn, he had devoted ſeveral ſermons to the conſideration of the nature, uſe, and abuſe of lots, intended to ſhew the lawfulneſs of innocent and entertaining games of chance, and the unlawfulneſs of the divinatory lots. What he delivered on this ſubject had been much miſrepreſented, and he was accuſed of having pleaded in behalf of gamblers, and encouraged the abuſe and miſemployment of time. In juſtification of his own conduct he publiſhed the ſubſtance of his ſermons, under the title "Of the Nature and Uſe of Lots, a Treatiſe hiſtorical and theological." This work occaſioned ſome controverſy, but it was received with conſiderable applauſe by the learned. In the year 1620 Mr. Gataker ſet out on a tour through the Netherlands; at Middleburgh he preached to the Engliſh church, and diſtinguiſhed himſelf by the ſpirit and ability with which he diſputed againſt the Catholic prieſts, who reſided in thoſe parts, together with the fugitives of their perſuaſion who had been obliged to quit England, for being concerned in the plots againſt the government during the reigns of Elizabeth and her ſucceſſor. Upon his return to England, he found that his Treatiſe on Lots had been attacked by Mr. John Balmford, whoſe work was prohibited on account of its virulence and illiberality. He firſt employed his intereſt in getting the prohibition removed, and then took up his pen to anſwer his antagoniſt. Some years afterwards he found himſelf called on again in defence of the ſame work, and publiſhed a juſtification of his arguments in the Latin language. In 1624 he entered the liſts in defence of the Proteſtant religion, againſt the Catholics. His firſt piece was entitled "Tranſubſtantiation declared by the Confeſſion of popiſh Writers to have no neceſſary Foundation in God's Word, and demonſtrated to be againſt Scripture, Nature, Senſe, and Reaſon." In 1642 he was appointed to ſit in the aſſembly of divines at Weſtminſter, and he attended in his place from a pure deſire of promoting truth and peace, and of rendering what ſervice he could to the religious intereſts of his country. In ſome caſes he differed from the majority, and, for the ſake of peace, impoſed on himſelf ſilence. In others he felt it a duty incumbent on him to cleave to his own ſentiments, and, by ſtedfaſtly adhering to his opinions, he was enabled, upon the introduction of the covenant into the aſſembly, with the aid of others, whoſe ſentiments were ſimilar to his own, to obtain conſiderable qualifications before they agreed to ſubſcribe. Mr. Gataker next engaged, with other members, in writing the "Annotations on the Bible," which were publiſhed in the name of the aſſembly. Mr. Gataker was the author of the notes upon Iſaiah, Jeremiah, and the Lamentations, which are generally admitted to have much merit. While he was thus employed he was offered the maſterſhip of Trinity college, which he thought proper to decline, in order that he might have more leiſure to attend to literary labours. He compoſed two works, in which his learning and critical talents were very advantageouſly diſplayed. The firſt was a treatiſe on the name by which God made himſelf known to Moſes and the people of Iſrael, entitled "De Nomine Tetragrammato Diſſertatio, quâ Vocis Jehovah apud noſtros receptæ uſus defenditur, &c." This has been frequently reprinted, and is to be found among the author's "Opera Critica,"

printed at Utrecht in 1698. The ſecond was entitled "De Diphthongis ſive Bivocalibus Diſſertatio philologica, in qua Literarum quarundarum ſonus germanus Natura genuina Figura nova et Scriptura vetus veraque inveſtigatur." In this the learned author endeavours to prove that in reality there are no diphthongs, and that it is impoſſible that two vowels ſhould be united in ſuch a manner as to form one ſyllable. During the compoſition of theſe learned works, Mr. Gataker had been almoſt laid aſide from his paſtoral duties by ill health; but when he was able he gladly returned to the duties of his profeſſion, till, by the rupture of a blood-veſſel, he was obliged to decline the ſervice of the pulpit altogether. He now ſpent his time almoſt entirely in ſtudy, and in 1648 he preſented to the world a work on the ſtyle of the New Teſtament, which gained him the character of being one of the ableſt philologiſts of the age. This was the precurſor to a much larger work of a ſimilar nature, and of great uſe in illuſtrating the ſenſe of difficult paſſages in the Old and New Teſtament, the primitive fathers, modern critics, and alſo in profane authors both Greek and Latin. At firſt only two of the ſix books, into which it was divided, were publiſhed, and the remainder were given to the world by his ſon after the author's death. Without attempting to particularize all Mr. Gataker's works, we may obſerve, that in 1652 he publiſhed his edition of Antoninus's meditations, with a very valuable preliminary diſcourſe on the philoſophy of the ſtoics. In 1648 he, with the other London miniſters, to the number of 47, remonſtrated againſt the meaſures taken by parliament againſt the king and the eſtabliſhed government. He ſeverely condemned, in public and in private, the execution of the monarch, and the changes which were introduced into the conſtitution. His ſentiments on this occaſion rendered him an object of ſuſpicion and jealouſy to the ruling powers, of which circumſtance his pariſhioners took advantage, and refuſed to pay him his dues. Toward the cloſe of a long life he was attacked by the famous aſtrologer William Lilly, becauſe in his annotations on Jeremiah he had expoſed the vanity and abſurdity of the judicial aſtrology. To the ſtrictures of the aſtrologer, Gataker replied with energy, and expoſed the ignorance and folly of the impoſtor. A ſecond attack from Lilly produced a rejoinder from the divine, which was the laſt of his publications, for almoſt as ſoon as it was finiſhed he was ſeized with a fever, which proved fatal to him in the 80th year of his age. By his contemporaries Gataker was highly eſteemed: he is called by Echard "the moſt celebrated among the aſſembly of divines;" "and it is hard to ſay," adds the hiſtorian, "which is the moſt remarkable, his exemplary piety and charity, his polite literature, or his humility and modeſty in refuſing preferments." He is equally praiſed by Morhoff, Bayle, Colonius, and others. Beſides the articles already enumerated, he was author of many other, the titles of which are given in the Biog. Britannica, to which our readers are referred for information reſpecting this worthy man and excellent divine.

GATE, in *Architecture*, a large door, giving entrance into a city, town, caſtle, palace, or other conſiderable building; or an aperture of paſſage for men, horſes, coaches, or waggons. The proportion of gates is from ſeven to twelve feet in width, and the height $1\frac{1}{2}$ the breadth. Where loaded carts of hay and ſtraw are to paſs, the height may even be twice the breadth.

The gates of London were many of them converted into gaols or priſons, as Ludgate, Newgate, &c. but they are now removed. The leſſer or *by-gates*, are called *poſterns*. Gates through which coaches, &c. are to paſs, ſhould not be leſs than ſeven feet broad, nor more than twelve; the height to be $1\frac{1}{2}$ the breadth.

GATE, in *Rural Economy*, a frame of wood conſtructed with a number of bars, and fixed in ſuch a manner as to ſwing upon hinges, for the purpoſe of affording convenient paſſage into and out of incloſed grounds, or other places.

In the conſtructing of gates, of whatever kind or form they may be, the materials ſhould conſtantly be well prepared by proper ſeaſoning before they are put together; as where this is not the caſe, they ſoon become much injured by their conſtant expoſure to the effects of the ſun and wind. They alſo require that the different parts be put together with conſiderable accuracy and correctneſs. In reſpect to durability, there can be no doubt but that oak is by much the beſt ſort of wood to be employed; but ſome of the more light kinds of wood, ſuch as thoſe of the deal, willow, and alder ſorts, anſwer the purpoſe extremely well, and are very durable, as, on account of their lightneſs, they do not deſtroy themſelves ſo much in ſhutting. It is found by experience that the lighter gates can be made in their foreparts, ſo that they be ſufficiently ſtrong for the intended purpoſe, the better they anſwer. For this reaſon, in ſome caſes, as where horſes are chiefly to be confined, the top bars, by being left of more ſtrength, may admit of the others having leſs ſubſtance; but if this be not done, they are apt to be broken by the horſes rubbing their necks upon them, unleſs where they are made of great height.

The width of gates for general purpoſes is moſtly from eight and a half to nine feet, and the height from five to ſix feet; the bars being five or ſix in number, and each four or five inches in breadth. Hence they are frequently denominated five or ſix-barred gates. In caſes where fowls or other ſmall animals are to be guarded againſt, it is ſometimes the cuſtom to run a ſmaller bar between the two lowermoſt ones, as by this means their paſſage is prevented.

In different ſituations and diſtricts gates are formed in very different manners, but thoſe chiefly employed are of four kinds; namely, the ſwing gate, the folding gate, the ſlip-bar gate, and the wicket or turn-about gate. Each of theſe ſorts of gates have likewiſe great variety in their forms, as may be ſeen in the annexed plate by the different figures.

The moſt ſimple form of gate is that of the ſlip-bar, which merely conſiſts in running three or four bars into the fixed poſts on each ſide. Theſe are moveable at pleaſure, ſo as to make way for any thing to paſs. The poſts may be either of wood or ſtone, being firmly fixed into the ground, and having proper holes formed in them for the reception of the bars.

A gate of this ſort is ſeen at *fig.* 1. in *Plate (Agriculture) Gates.*

It has been obſerved that this is perhaps the moſt durable of any ſort of gate, particularly where the gate-poſts are of ſtone. The only objection that can be made to it is that of the trouble of opening and ſhutting it, which, when perſons paſs through it in a hurry, renders it liable to be left open. Its cheapneſs and laſting property render it in every other reſpect preferable to any other deſcription of gate. The only inſtances in which it does not perfectly anſwer, are thoſe near the verge of a farm, or on the ſide of a highway or other public road, as it does not admit of being locked or ſecured as other gates are. In the whole of the interior of farms or eſtates, it is, however, generally found the moſt cheap, convenient, and uſeful gate that can be employed by the farmer.

The ſwing gate is that which is next in the ſimplicity of its conſtruction. This varies very greatly in its forms and

dimenſions, as may be ſeen by referring to *figures* 2, 3, 4, 5, 6, 7, and 8, in the plate. The gate which is repreſented at *fig.* 2. is formed upon an improved principle; and highly eſteemed in many diſtricts of the kingdom. There is a projection on the fore-part of the har-tree as ſhewn at *a*, which riſes nine inches; and on which the lower end of the diagonal bar, that paſſes upwards, reſts; *bb* is the diagonal bar, through which the three middle horizontal bars paſs; *cc* is a perpendicular bar fixed into the uppermoſt bar, ſix inches from the inſertion of the diagonal one at *d*, and into the lowermoſt one at *e*; *f* is the ſpring on the fore-tree, by means of which the gate faſtens.

Another gate of larger dimenſions, but of the ſame kind, is ſhewn at *fig.* 3. in the ſame plate. In this there are, however, three upright bars, as ſeen at *aaa*, and *b* is the diagonal bar which acts as a brace to the whole.

A further improvement on this ſort of gate is repreſented at *fig.* 4. in which there are two diagonal bars meeting in the middle from the bottom extremities of the har-tree and fore-tree, with an upright middle bar, and two braces paſſing from the top till they meet the diagonal pieces. Theſe different parts are ſeen at *aa*, *bb*, and *c*.

Theſe are all highly uſeful forms of gates for farm purpoſes.

A common form of ſwing gate is likewiſe ſeen at *fig.* 5. in which there is ſimply one diagonal brace, which renders it capable of being conſtructed at but little expence.

An improved ſwing gate, recommended by Mr. Parker, in his "Eſſay on hanging and faſtening Gates," is repreſented at *fig.* 6. And he remarks that the gate that is in moſt general uſe in Shropſhire weighs about 130 pounds without the iron-work, and that its dimenſions are theſe:

	Inches by Inches.
Heel - - - - -	5 .. $2\frac{1}{4}$
Head - - - - -	$2\frac{1}{4}$ .. $2\frac{1}{4}$
Rail near heel - - - -	$3\frac{1}{4}$ .. 3
——— head - - -	3 .. $2\frac{1}{2}$
Bars near heel - - -	$3\frac{1}{4}$ .. 1
——— head - - -	$2\frac{1}{4}$ .. $0\frac{1}{4}$
One diagonal and two perpendicular bars, or lacings, each	$3\frac{1}{4}$ .. 1

It is added that the diagonal bar, riſing from the lower part of the heel of the gate, meets the middle of the rail, and the two upright bars are placed at proper diſtances, between the middle and the head of the gate: theſe croſs bars, it is ſuppoſed, muſt aſſiſt greatly in keeping the gate together, but that what is moſt to be guarded againſt is, the ſinking at the head; and to prevent which, the gate ſhewn in the above figure is not indifferently contrived.

It may be further noticed that the rail and the horizontal bars of this gate are much the ſame as thoſe juſt deſcribed, but that the diagonal bar *c* is let into the lower part of the heel *a*, with a firm reſt or butment, its upper end coming exactly into the angle formed by the rail *f*, and the head *b*; and it is alſo ſupported in its place by the upright bars *d* and *e*. From this arrangement it would ſeem that the bar *c* might be likely to puſh the head *b* out of its place, were it not counteracted by the upper thimble being attached to, or forming one end of a flat bar of iron, which paſſing through the heel and along the top of the rail, extends to the head of the gate, having been hammered into an equal width and thickneſs at the part which goes through the head, and is finiſhed at the end with a ſcrew and nut: the iron bar is fixed to the rail with five or ſix ſtrong nails, that ſecure the whole; and this, the writer ſuppoſes, appears to be much more likely to anſwer the purpoſe wiſhed for, than any other plan he has ever met with.

A gate of this kind, it is obſerved, has juſt been made for him by the direction of an ingenious mechanic; he cannot anſwer for its merits, but is aſſured that it has been tried with great ſucceſs. The weight of the iron ſtrap or bar is twelve pounds, which, at 5*d.* per pound, and 2*d.* for the ſcrew nut, will coſt 5*s.* 2*d.*; but it is queſtioned whether a much lighter bar, even ſo ſmall as half the weight of the above, would not be found to anſwer, if that of twelve pounds weight ſhould be thought too expenſive: the bars *c*, *d*, *e*, are $2\frac{1}{2}$ inches by $1\frac{1}{2}$, or a full inch. A gate of the common upright ſwing-kind is ſhewn at *fig.* 7. which is a good uſeful one where there is a neceſſity for one of the cloſe ſort. It has three rails, to which upright bars are nailed in a pretty cloſe manner.

At *fig.* 8. is ſeen an improved ornamental gate of this deſcription. It conſiſts of three rails, to which are nailed upright bars that reach conſiderably above the top rail, and it has two diagonal braces that meet in an acute angle in the middle of the top of the gate. The har-tree is alſo crooked at the top, in order to afford an ornamental effect. This is a cloſe ſtrong gate, but too expenſive for common uſes.

The great objection to ſwing-gates of all kinds is their liability to be deſtroyed by their great length of frame.

The folding-gate is found more convenient in many caſes than either the ſlip-bar or thoſe of the ſwing kind. An open folding gate, proper for common uſes, is repreſented at *fig.* 9. And one of the more ornamental cloſe kind is ſhewn at *fig.* 10. Experience has ſhewn that this deſcription of gate is much more durable than thoſe of the above kinds; as the bars, from being only half the length, render the joints not nearly ſo liable to be broken, or the hinges to be injured by over-ſtraining; and the difference in the firſt coſt conſiſts ſimply in the expence of a pair of additional hinges.

The wicket or turnabout gate is another ſort that is frequently found uſeful in particular ſituations. A gate of this deſcription, proper for common purpoſes, is ſeen at *fig.* 11, in the plate. And at *fig.* 12. is ſhewn one of the more ornamental ſort, which turns about on the middle or centre-poſt *a*, and is commonly formed of light iron work. It has a very neat appearance.

All ſorts of gates ſhould be carefully attended to in keeping them well painted, and free from dragging upon the ground in the fore-parts, as by ſuch care they will laſt much longer than where the contrary is the caſe.

GATE *Poſts*, the pillars or upright ſtrong pieces of timber, or other materials to which gates are hung and faſtened. Poſts for this uſe are formed of very different ſubſtances, but principally of ſtone or timber. It has been obſerved that where it can be done, they ſhould always be of ſtone, and ſuch as is hewn if poſſible, as theſe, when properly conſtructed, will laſt for ages: where wood is employed, oak well ſeaſoned is undoubtedly the beſt, and ſhould always be of conſiderable ſubſtance. In ſome places it is the practice to plant quick growing trees for this purpoſe, and when they have attained a ſuitable growth, to cut them over about ten feet from the ſurface: theſe, where the trees grow well, form very durable gate-poſts; but they ſometimes ſhrink, and occaſion much trouble in remedying the inconvenience. They are alſo liable to ſhake and get looſe by the wind. Where dead timber is made uſe of for this purpoſe, the

poſts

poſts ſhould be very ſtrong, and the wood conſtantly well-ſeaſoned; that part which is let into the ground being well defended by ſoaking it in coarſe oil, charring, or giving it a coat of coal-varniſh, and all that is above expoſed to the action of the weather ſhould be well covered with two or three good coats of ſome ſort of oil paint. The expence incurred in this way is but little, while the advantage gained is very conſiderable.

It is ſuppoſed by Mr. Parker, in the eſſay mentioned above, that for timber gate-poſts the ſubſtance ſhould not be leſs than from eight to ten inches in the ſquare, and that for very heavy gates a foot in the ſquare is by no means too much. And even if formed of ſtill larger ſize it is better. The ſteadineſs of a gate-poſt in a great meaſure depends upon the depth to which it is ſet in the ground, which ought in ſome caſes to be nearly equal to the height of it. But in general, five or ſix feet are fully ſufficient for the purpoſe. A ſtrong frame of wood placed under the ground, ſo as to connect with both poſts, may in ſome inſtances be uſeful in keeping the poſts ſteady without the labour of putting them in ſo very deep.

Since a well-conſtructed gate cannot be uſed to advantage without ſuitable poſts, it is ſuppoſed neceſſary to ſay a few words about them. And, as much trouble and expence may be ſaved by a proper underſtanding in what regards their length and ſubſtance, the calculations given below are ſubmitted to the reader's attention. It is ſuggeſted that an oak poſt ten inches ſquare, and eight feet long, is ſufficiently ſtrong for ſuſpending the gate ſhewn at *fig.* 6. in the plate; and it will contain five and an half feet of timber, or exactly 5 feet 6 inches and 6-10ths, the value of which muſt depend on its quality; but for common purpoſes the lower part of a tree of the dimenſions ſhewn at *fig.* 13, will conſtitute four excellent poſts for uſe, though their form may not be thought ornamental, and will contain by cuſtomary meaſure nineteen and an half feet, or exactly nineteen feet ſix inches and three-tenths, but the true meaſure of the part of a tree, ſuch as ſeen at the above figure, is twenty-three feet, or exactly twenty-three feet one inch and three-tenths; this leaves to the purchaſer of round timber, taking in the ſap, an advantage, it is contended, in the proportion of from 50 to 39, or upwards of from five to four. A part of an oak-tree without the bark, fit for this intention, is ſeen at *fig.* 13. in the plate. The money eſtimate of theſe gate-poſts is ſhewn below.

	£.	s.	d.
To 4 poſts containing 19½ feet cuſtomary meaſure, of moderately good oak, ſeveral inches of which, in the length towards the root, are of little or no value, taken together at 2*s.* a foot - - - - -	1	19	0
32 feet of ſawing at - - - -		1	0
	2	0	0

If this be divided by four, it will give 10*s.* per poſt; which value, though ſeemingly high, will, it is aſſerted, be ſoon compenſated, in the avoiding the continual charges of altering and propping inſufficient poſts. Beſides, theſe dimenſions exceed the ſize of ten inches ſquare, even after allowing for the early decay of the ſap on the round ſide of each poſt; inſomuch that a part of a tree of ſmaller dimenſions might ſerve for the purpoſe; ſuppoſe the circumference of a part of a tree without the bark, intended for four poſts, were only 5 feet 8 inches, inſtead of 6 feet 3 inches and 4-10ths, which is the circumference anſwering to the diameter of 2 feet, it would contain 16 feet 9 inches and 6-10ths by cuſtomary meaſure, including the ſap, which would be nearly equal, in ſtrength, to 4 poſts of 10 inches ſquare; for each of ſuch poſts will meaſure, in the true way, more than five feet; and the four poſts, as ſhewn at *fig.* 13, would be reduced 7*s.* in price, or 1*s.* 9*d.* each, leaving their value about 8*s.* 3*d.* a piece. Mr. Parker conſiders it as frivolous to add illuſtrations upon queſtions, to which ſimilar caſes are detailed, in every common book on menſuration of ſolids; but he feels it highly neceſſary to take notice of the outline of thoſe facts, which, like other parts of the ſubject, are not generally practiſed upon: and further, ſhould a gate of his recommendation be found to lodge its head upon the ground, he begs to be conſidered as *accountable* only for the *gate*, and not for the poſt on which it hangs, unleſs his advice in that reſpect may alſo have been duly attended to. And it muſt be underſtood that he is eſtimating the value of an oak gate-poſt of a certain ſtrength, and not cavilling about the difference as to the cuſtomary and true meaſure of round timber, for the market price of timber is conſidered as applying to a particular meaſure, and taking into the account the waſte in converting round timber to uſe.

It is a good method to prevent gate poſts from falling forward, and the gate, of courſe, ſtriking upon the ground, in the fore-part to have ſtumps placed againſt the front parts of them, at the time they are firſt fixed into the earth, in ſuch a manner as that, while they act powerfully againſt the poſts, they may not appear above the ſurface of the land, and prove inconvenient. Theſe ſhould always be ſtrongly nailed to the poſts, and be formed of well-ſeaſoned pieces of oak, being firmly rammed up at the ſame time with the poſts.

GATES, *Hanging and Faſtening of.* The modes of fixing or attaching them to the poſts, by hinges, or other means, in order that the gate may open and ſhut with eaſe and convenience; likewiſe the methods of ſecuring them ſo as to keep them ſhut.

The hanging of gates is a buſineſs that requires ſome ſerious conſideration to effect it in a proper manner. It is obvious that they ſhould have a certain degree of velocity, without having too much, in ſhutting themſelves; but this is not attained without ſome degree of difficulty. The author of the Rural Economy of the Midland Counties remarks, that though he had paid much attention to the hanging of gates in Yorkſhire, both with pivots and hinges, and had acquired an adequate idea of the leading principles, yet not having committed it to writing, the real nature of it had eſcaped his recollection, and a falſe notion of it ſupplied the place; which was, that the only thing neceſſary was to throw the gate out of the upright, ſo as to lean towards the poſt; it being no matter whether this inclination of it was attained by the hooks or the thimbles. And that, led by this falſe notion, he had conceived that the ſimpleſt, and conſequently the beſt way, to hang a gate, would be to put the hooks in exactly perpendicular to each other, and to give the fall by the thimbles alone. He conſequently prepared a bottom thimble, with a claſp to take the har-tree, and with an eye at each corner, in order that the gate might be occaſionally hung on one ſide or other of the fence, as the occupation of the incloſure might require, and with this thimble hung a gate.

The centres of the pins of the hooks being placed exactly perpendicular to each other by a plumb line, the gate was hung on; but inſtead of falling this way or that, it ſtood ſtationarily wherever it was ſet. Finding himſelf thus at a ſtand without inclination to remain long in ſuch a diſgraceful predica-

predicament, he ſet the workmen to other buſineſs, and himſelf to the inveſtigation of the principles of gate-hanging. After muſing for ſome time, with the gate in his hand, and ſketching his ideas afterwards on paper, he ſaw clearly, and to demonſtration, that the fall depended entirely upon the hooks; the axis of motion is given by the ſituation of the hooks with reſpect to each other; and, whichever way the axis of motion inclines, that way the gate will fall.

The theory of this principle is eaſily demonſtrable; but it requires diagrams to explain it, and is merely elementary. It is ſuggeſted that a gate ſhould have two, what are termed falls; one at the poſt, to make it catch; and another at a right angle to the gateway, to prevent its ſtanding open. The quantity of fall muſt vary with the uſes and length of the gate, and the judgment or fancy of the hanger. If a gate has too much fall at the poſt, it is liable to beat itſelf to pieces; if too little, it does not catch with ſufficient certainty, and is liable to be blown open by the wind, and thus become a deception, rather than a ſafe-guard. On ſufficient trial, it has been found, that for field gates, one inch and a half at the poſt, and an inch at the right angle, give what appears to the writer a proper fall to them.

In regard to the thimbles, the only uſe of their being made in this or that form, is, to counteract the croſs winding or obliquity of the hooks; ſo that the gate, when ſhut, ſhall hang plumb and level; or every way in a perfectly upright poſition. The way to aſcertain the true poſition of the hooks, is that of taking a plumb line, or any ſtring with a ſtone tied in it, and looking along the line of the fence or gateway, to drive the hooks, or move the poſt, until the centre of the pin of the upper hook appears, by the line hanging perpendicularly before the eye, an inch and a half nearer the middle of the fence, than that of the under one; and then looking along the line of the road, or perpendicularly to the gateway, ſee that the centre of the pin of the upper hook ſtands one inch nearer the middle of the road than that of the under hook; obſerving likewiſe that the pins of the hooks ſtand, not exactly upright, but in a line with each other, forming one direct axis of motion.

It is ſuggeſted, that as gates are liable to ſag, or ſink down by hanging, they ſhould conſtantly be hung ſomewhat above the level, rather than below it. The top thimble being uſually put into the middle of the har-tree, with the eye as near to it as the ſhoulder of the hook will admit, the counteraction of courſe depends on the bottom thimble. If this thimble be made with two ſtrong ſtraps, to claſp the lower part of the har-tree, as it always ought, with an eye on one ſide, or with two eyes, one on each ſide, and their centres three inches apart, with projecting necks, when fixed, one inch farther from the har-tree than that of the upper thimble, or, more accurately ſpeaking, with the centre of the eye or eyes of the lower thimble ſtanding an inch further behind the har-tree, than the centre of the eye of the upper one, the gate acquires, on a certainty, the requiſite fall, yet hangs level and upright when ſhut.

Other directions for effecting the buſineſs of hanging gates are ſtated in the corrected Report of the County of Northumberland. Having ſet the poſt perpendicular, let a plumb line *a b*, *figure* 2. in the plate, be drawn upon it; on this line at a proper height put in the hook C, ſo that it may project three inches and a half from the face of the poſt, and at a convenient diſtance below this, put in the lower hook D, an inch and a half to one ſide of the perpendicular line, and projecting two inches from the face of the poſt; then put the top loop or eye two inches from the face of the har-tree, and the bottom loop three inches and a half from it; and when thus hung, the gate will, it is contended, have a tendency to ſhut, in every poſition in which it may be placed.

For if the weight of the gate be repreſented by the line *c d* in the diagram accompanying *figure* 2, this, by the reſolution of forces, is reſolvable into other two, namely, *c e* and *d e*, as ſeen in the ſame diagram, the former repreſenting that part of the weight which preſſes in a perpendicular direction, and the latter, that part of it which preſſes horizontally, and gives the gate a tendency to ſhut. It is remarked that this is a principle that has been long known and practiſed in the hanging of gates that open in both directions.

This ſubject has been ſtill farther inveſtigated and explained in a late eſſay, by the ingenuity and exertion of Mr. Parker, who obſerves that "a gate, when ſuſpended by hinges, is a lever of the ſecond kind, in which the weight is placed between the power and the fulcrum; for it is evident, that the hand applied to the head of the gate is the acting power, that the gate itſelf is the weight to be raiſed or moved, and that the hinges are the fulcrum or centre of motion." And that "when the hooks or pivots upon which a gate is hung are preciſely in the ſame perpendicular line with each other, the gate will be at reſt wherever it may be placed; and the ſame power which is required to move a gate thus ſuſpended through any given arc of the circle, will be exactly ſufficient to bring the gate back to its former poſition; in proof of which he would inſtance a common door to a room with plain hinges. But the ſmalleſt variation of the hooks from their perpendicular line, will attach to a gate, ſo ſuſpended, one determinate line of reſt, and no other; and from any part of the circle which the gate may be made to deſcribe, it muſt have a conſtant tendency to fall to that line of reſt." That "the line of reſt for a gate will always be where the head of the gate approaches neareſt to the ground, and from thence being moved half a circle to the right or left, it will there attain its greateſt height, and ſupport itſelf, or with a very ſlight aſſiſtance may be ſupported in equilibrio."

But that "when a gate is in its line of reſt, or in its oppoſite line of equilibrium, the two hooks by which it is ſuſpended, and the centre of the gate's gravitation will be found to be in one and the ſame vertical plane: which will be eaſily underſtood by obſerving a common gate, whoſe hinges may be put on in any manner, however awkward or perverſe. And when the hooks are in a perpendicular line with each other, it can admit of no doubt, that they muſt always be in the ſame vertical plane with the centre of the gate's gravitation, becauſe they will be ſo with any third given point whatſoever.

"Theſe general principles are alſo applicable to any common ſwing-gate, which has two or more pivots or hooks at the lower hinge, when the poſition of either one of the lower pivots is conſidered with regard to the upper hook." And, in further explanation of theſe principles, a figure is given in the Eſſay, which is ſuppoſed "the outline of a gate 9 feet 2 inches long, from the fore-part of its head to its upper point of ſuſpenſion, repreſented in the line of reſt, as well as in the oppoſite line of equilibrium, ſhewing the velocity with which the gate is made to fall, from an elevation of 6 inches gained at the head, in attaining its line of equilibrium; eſtimated from the line of reſt, by means of the poſition of the two hooks, and the proportionate extra length of the lower thimble." It is added, that "the line of faſtening ſhould be 22 deg. 30 min. or 1-16th part of a circle

circle ſhort of, or within the line of reſt; and conſequently the correſponding line of equilibrium will alſo be 22 deg. 30 min. ſhort of the greateſt extent of the gate's opening." But, however, in order "to prevent the gate being left unſhut, it is adviſed that a ſhort poſt ſhould be placed at about half the diſtance between the road to be paſſed, and the fence adjoining the hanging-poſt, that is, 22 deg. 30 min. within the line of equilibrium; ſo that the gate ſhould not open from its line of faſtening more than about 135 deg. which will anſwer every purpoſe; and the hinges muſt be ſo adjuſted, that the gate ſhall be perfectly upright at its line of faſtening." It is conceived, that "a gate ſuſpended in this manner cannot be left open, excepting in high winds, but will ſhut of itſelf, though not with an uniformly accelerated motion, as might be ſuppoſed; its velocity being rather increaſed, as it paſſes the middle part of its ſemi-circular courſe, and retarded again as it approaches its line of reſt, coinciding with the proportionate riſe of the head; allowing only for ſuch acceleration as muſt be acquired while the gate, in falling with a continued motion, recedes more and more from the line of equilibrium: as the verſed ſine of the angle, formed by the gate with its line of reſt, is to the length of 110 inches, which is the made radius; ſo will be the correſponding riſe of the head of the gate to 3 7-16ths inches, or half the whole riſe of the gate's head, at any given angle within the quadrant, and the riſe in the head afterwards will be as the coſine of any given angle, formed by the gate with its line of equilibrium, in deſcribing the complement of that angle, is to the length of the gate, or radius; ſo will be the correſponding riſe of the head of the gate, to the remaining 3 7-16ths inches; which coſine of the angle formed by the gate, with the line of equilibrium, is equal to the ſine of the complementary angle, or angle of the gate's progreſs, from a radius at right angles to, or equidiſtant from, the lines of reſt and equilibrium, in performing its ſupplementary courſe. Thus it is evident, that though the riſe of the gate at the head in the firſt 90 deg. or half of its ſemicircular courſe, be 3 7-10ths inches, yet in the firſt and laſt 22 deg. 30 min. of its courſe, it will riſe only $\frac{1}{4}$ of an inch, or exactly 6-24ths and 69-116ths or a 24th in each reſpectively: and reſpecting the quarter fractions, the riſe of the gate's head, and correſponding velocity of the gate's fall, in equal eighth parts of its ſemicircular courſe, is nearly in proportion to the numbers 6, 16, 26, 32, and then inverſely, 32, 26, 16, and 6. And in order to illuſtrate the matter ſtill more clearly, he adds a repreſentation of the horizontal ſection of two hooks for a right-handed gate, opening one way, brought into one place of obſervation, the upper hook, the lower hook, the line of faſtening, the line of reſt, and the line of equilibrium. The diameter of the hooks 13-10ths of an inch, which is the proper ſize for a common gate. The horizontal diſtance of the lines falling from the two hooks, being 15-12ths or 2-4ths of an inch, is the meaſure adapted to hinges which are 40 inches aſunder. In adjuſting the hinges, it is neceſſary that the upper thimble ſhould incline $\frac{1}{4}$ of an inch from its centre, towards the hanging-poſt, and that the lower thimble ſhould be ſcrewed into the heel of the gate $\frac{1}{4}$ of an inch out of the ſtraight line, inclining in the oppoſite direction, that is from, inſtead of towards, the hanging-poſt, both the thimbles together making a variation of the 6-12ths of an inch, and to correſpond with this variation, the upper hook ſhould meaſure, from the centre of the pin to the ſhouldering, about half the thickneſs of the heel of the gate, as the 1-6th inch inclination of the upper thimble will allow ſufficiently for the gate hanging clear of the poſt. The longer hook muſt be 6-12ths inch longer than the upper hook, and muſt be driven into the gate-poſt 1 1-6th inch out of the perpendicular line of the perforated part of the gate-poſt, in which the hooks are to be received; as the lower thimble muſt alſo exceed the upper thimble in length 1 2-4ths inch, ſuppoſing the gate to be a right-angled parallelogram; or, at leaſt, the rail and heel to be at right angles with each other, elſe the lower thimbles muſt be extended by a waſher, to make up the deficiency, which, however, will not at all interfere with the velocity of the gate's fall; becauſe the hooks are the centre of motion, upon which all adjuſtment, as to the gate's fall, depends: the places of the thimbles influencing only the upright poſition of the gate when faſtened. The numbers of 8-12ths rather ſurpaſs, it is obſerved, the preciſe meaſure of their reſpective ſides of the triangle, but are nearer to the truth in calculation, than any workman could attain in applying theſe directions; for, in neither caſe, do they exceed their true meaſure ſo much as 1-24th of an inch, and therefore, in the one, the clear ſum of $\frac{1}{2}$ inch is aſſumed for general purpoſes, and ſhould the hinges be leſs than 40 inches aſunder $\frac{1}{2}$ inch will be rather too much; or, were they to be more than 40 inches diſtant from each other, $\frac{1}{2}$ inch, on the contrary, would be rather too little for the juſt proportion."

It is conſidered as certain, "that a ſmall ſpace muſt be loſt in hanging a gate, though the hooks and thimbles be made with the greateſt exactneſs; for the weight of the gate will draw the upper thimble to bear upon the hind part of the upper hook, and will preſs the lower thimble againſt the fore-part of the lower hook: this muſt, however, be trifling where the hinges are well fitted, and no allowance is made for it in the drawings which he has given; becauſe the lower thimble gains as much upon the upper one by their being placed $\frac{1}{2}$ inch, that is $\frac{1}{4}$ inch each, out of the plane of the gate's extenſion, as appears by the difference of the ſides of the triangle numbered 114-12ths, and 15-12ths equal to 1-12th inch, by the meaſure of 15-12ths, which is aſſumed but nearly about 1-14th inch more, as ſtated above; or, on the whole, equal to 1-8th inch, which is a good general equivalent for the loſs in hanging a gate, and will uſually be ſufficient to preſerve the upright poſition of the gate when faſtened, without having recourſe to a waſher at the lower thimble."

He ſtates, that the "velocity, as above given to the gate's fall, will be commonly ſufficient, without any care of oiling the hinges; but the effect of wind cannot be counteracted in gates by any good conſtruction of the hinges; for were a velocity given to a gate's fall, equal to the reſiſtance of ſo powerful an agent, the gate would ſoon want repair, from the conſtant violence of its ſhutting, and be ſo much the heavier in the hands of a horſeman: beſides, when a ſtrong wind blew in the ſame direction as that of the gate's fall, no man on horſeback would be able to withſtand its force; and well-conſtructed gates are moſt liable to be acted upon by wind from their wide extent of ſurface; but if paſſengers are ſo careleſs as to leave gates open under ſuch circumſtances, there will be one ſatisfaction remaining; that is, as ſoon as the wind ceaſes, the hinges muſt reſume their property, and the gates faſten of themſelves."

Different directions are alſo given for aſcertaining the proper poſition of the hooks, in caſes where the hinges of gates are more or leſs than 40 inches aſunder; in proving the truth of which, "ſuppoſe," ſays he, "a gate to be 110 inches long, and that it is intended to riſe at the head 6 7-8ths inches in its ſemicircular courſe, from the line of reſt to the line of equilibrium, then as the length of the gate is to the

diſtance

diſtance between the two hinges, ſo will be 6 7-8ths inches to double the horizontal diſtance of two perpendicular lines, one falling from each of the hooks." Or, "take any other diſtance of the hinges from each other, and the required extra length of the lower thimble may be found by placing the numbers 110, and 6 7-8ths, as the firſt and ſecond term of a rule of three proportions, and the new diſtance of the hinges muſt be the third term, the anſwer, divided by two, will be the ſought-for horizontal diſtance of the two, the perpendicular lines falling from the hooks (adding the loſs in hanging the gate), the anſwer for one is the meaſure for the other."

It is believed that "theſe general rules will find a tolerable accurate meaſure in all caſes; for where a gate, or wicket, is ſhort and light, the friction of the hinges will be leſs in two reſpects, both by the diminiſhed preſſure on the hooks, from the gate's lightneſs, and the reduced diameter of the pivots, which will ſupply what is wanting in the weight or momentum of the gate. On the other hand, when the gate is long and heavy, its increaſed weight, or momentum, and its length as a lever, will be oppoſed to the additional frictions of the hinges." And further, that "in caſes where old hinges are badly made with large hooks or deep thimbles, that difficulty is to be met by taking the proportion for the diſtance, of the two hinges, from each other, at five or ten inches more than it really may be, with reference to the given table, or by adding ſomething to the uſual horizontal diſtance, of the lines falling from the hooks. But when the thimbles are of a long cylindrical form, they are extremely apt to bind upon the hooks, and will ſometimes put a dead ſtop to the gate's motion. With ſuch thimbles, the attempt of adding to the velocity of a gate's fall, may only increaſe the binding or friction, and the remedy of this defect, therefore, is to make the hooks much ſmaller than the thimbles; in new thimbles no form, but that of annular or ring-like, ſhould be admitted. But by the lower thimble being furniſhed with a ſcrew of equal diameter throughout its length, its extra length may be regulated to ſo great a nicety as half a turn of the ſcrew, and may either be let into the heel beyond the ſhouldering, or lengthened out by a waſher, as circumſtances require, in adapting it either for hinges, which are leſs than forty inches aſunder, or the contrary, without the help of a blackſmith, or any freſh forging, which is always troubleſome and expenſive. And if a gate ſinks at the head, without any fault in the hanging-poſts or hooks, the lower thimble may be lengthened out, to bring the gate upright, and the hooks remain unaltered."

Further, that "the gate-poſts being fixed about eight feet nine inches aſunder, will be adapted for a gate nine feet long, or nine feet two inches, including the thimbles; the thimbles being attached to the gate in the manner above directed, let the gate be ſupported where it is to hang and faſten, and then drive in the upper hook, at a convenient diſtance from the edge of the hanging-poſt, ſo that the upper hinge ſhall not be in the way of any carriage paſſing the road, but at the ſame time ſo near to the edge of the poſt, as to loſe no more room from the road than is unavoidable by the head and heel of the gate, extending a little upon the two poſts. It is not neceſſary to the gate, that it ſhould lap againſt the hanging-poſt at all, but ſince the head ought to meet the falling-poſt at leaſt with half its ſubſtance, or from that to two inches, the hanging-poſt ſhould be nearly as much covered by the heel, for the ſake of uniformity.

"When the upper hinge is fitted, the gate ought to be ſupported upright, for aſcertaining the place of the lower hook, and if the thimbles are properly put on, the poſition of the lower hook cannot be miſtaken. Both hinges being fitted, it remains to be found, whether the hooks are in their exact places; for this purpoſe take two plumbed lines, with fine threads, and heavy even-ſided plumbs: if the hooks are well finiſhed, the obſervation reſpecting their centres may be taken, by faſtening the plumbed lines round the hooks, and letting them fall from the outſide of ſimilar parts of the hooks; forty inches being the given diſtance of the hinges, the horizontal diſtance of the two lines falling from the hooks ſhould be $1\frac{1}{4}$ inch, and in a line which forms an angle of 22° 30′ with the gate's line of faſtening: take, therefore, a common two-feet rule, and having opened the legs to the angle 22° 30′, place one ſide of it againſt the plumbed lines, which ought to anſwer to the meaſure of $1\frac{1}{4}$ inch, while the other leg of the rule ſhould be parallel to the gate's line of faſtening; a ſlight blow or two with a hammer, on one or both of the hooks, in the direction neceſſary, will complete the adjuſtment, and the gate will be found to ſhut of itſelf for any time within 135°, from its faſtening, and without violence, whether open to the ſmalleſt, the greateſt, or any intermediate angle preſcribed by the ſhort poſt, which ſhould be placed to meet the middle part of the gate, at the angle of about 135° from the line of faſtening. Further, it might be prudent before the ſhort poſt were put down, to aſcertain at what line the gate will ſtand open, or be poiſed by the friction of its hinges, towards the line of equilibrium, which will diſcover how near the workmen may have adjuſted the line of faſtening to 22° 30′ ſhort of the natural line of reſt; and if the gate is found to fall properly, the ſhort poſt may be put up accordingly, though the method deſcribed may not have been minutely purſued; taking care that the ſhort poſt be ſufficiently within the line of equilibrium, and that the gate ſet off from the ſhort poſt with a velocity equal to overcome any increaſed friction by ruſt of the hinges; for oil ſhould not be uſed at all, as its occaſional aid is not to be depended upon."

It is further ſtated, that "indifferent gate-poſts are liable to get out of their right poſition; the conſtant weight of the gate muſt have a tendency to pull the hanging-poſt inwards; the fall of the gate may make the falling-poſt recede from the direction of the frequent blows it receives, and heavy carriage-wheels paſſing near the poſts, will occaſion them to open outwards, and the natural or artificial ſlopes of the ground adjoining gate-poſts often affect their upright poſition, and decline them from the higher ground, and many other cauſes, produce ſimilar effects; to obviate which, many contrivances have been recommended, ſuch as mortiſing the pair of gate-poſts together by croſs pieces of timber under the road; but the moſt effectual preventive of the evil appears to be that of letting down the poſts very deep into the ground, which will ſuperſede the expence of croſs timbers, and in gaining a firm hold at their baſis, they will be the better ſecured both from natural and accidental diſplacement. Gate-poſts for common gates ſhould be from eight to eight feet and a half in length. See GATE, *Poſt*.

Care is alſo to be taken, in hanging a gate, to chooſe the beſt ſide for it to open; in doing which there are two circumſtances to be conſidered; the principal one is, that there may be plenty of room for a ſervant on horſeback to hold the gate while a carriage paſſes, and the other is to avoid its opening againſt any croſs-road or path, and to which ſome attention is due to the treſpaſs of cattle from a common

common road or otherwiſe; and it is thought more ſecure for a gate to open againſt that ſide from which the treſpaſs may be moſt apprehended. In ſome caſes, it is adviſable to furniſh a hanging-poſt with a pair of hooks, on both ſides of it, ſo that the gate can be ſhifted as occaſion may make it convenient.

"A key-hole and cotter may be put into the lower hook, to ſecure the gate from being taken off its hinges for idle purpoſes; or a ſtud rivetted to one ſide of either of the hooks, with a little notch cut in the ſtrongeſt part of the adjoining thimble, is a ſimple and good contrivance, whereby a gate is prevented from being taken off the hinges when ſhut; but is eaſily taken off, at ſome one part of its courſe, when required, where the ſtud comes oppoſite to the notch, and admits the thimble to paſs over the ſtudded hook. And it is not uncommon to ſee one hook driven into the poſt with its point upwards in the common way, and the point of the other hook in the contrary direction, which is an effectual mode of keeping the gate on its hinges, but it has the inconvenience of not permitting the gate to be removed without drawing one of the hooks.

"The ſame principles are applied in the hanging of gates on the contrary ſides, and likewiſe to thoſe of ſwing-gates," a full explanation of which may be ſeen in the very uſeful Eſſay referred to, as well as the method of ſawing timber for gates and gate-poſts.

The writer has ſuggeſted "that the common field-gates admit of a material diſtinction from road-gates in ſeveral reſpects; for, as to thoſe, which are uſed very ſeldom, or are generally locked, it is of little conſequence, ſo that the fence is made complete, whether they ſhut of themſelves or not: and ſome people think that a light high gate is preferable to a low and heavier one; but he has heard a gate of about 4½ feet high recommended for ſeveral reaſons, and particularly as a fence againſt horſes; becauſe the top rail would meet their wind-pipes inſtead of their cheſts, and being able to put their heads over it, they would be the leſs likely to force it with their rumps." And that "a gate opening out of a field into a public road, ſhould be ſuch as no one could eaſily get over, with upright pales for inſtance, ſharpened at the top, and it might be higher than uſual: there is no objection to ſuch gates opening double, as folding-doors, and he would prefer the hooks for hanging them to be perpendicular to each other, ſo that the gates ſhould remain wherever they might be placed; and no other faſtening ought to be allowed but a lock and key: this ſuppoſes that there is no common road or path through the field." But, "in very heavy lodge-gates, and turnpike-gates, he has ſeen the lower hinge contrived in ſuch a manner as to have a piece of iron let into a ſtone, with the top of the iron rounded and bevelled acutely towards a point, and a ſocket which may be faſtened to the heel of the gate with ſcrew-pins and nuts; and the ſocket is of courſe leſs acute than the bevel to be received, ſo that as little friction as poſſible may be occaſioned in opening the gate by the twiſt of the hinges, which in neither caſe will be perpendicular to each other. The pivot is well protected from rain and dirt in this manner, but he would always prefer the common hooks and thimbles of a proper ſtrength; and if it were thought neceſſary, the gate might be in part ſupported by a ſmall roller or caſter placed under the heel. And he has alſo ſeen the lower hinge of a ſwing-gate formed with four hooks, or pivots, the two middle ones being projected a little further from the hanging-poſts than the others, and the part attached to the gate indented to anſwer the hooks: but the ſame objections apply to this as to thoſe noticed already.

TABLE.

The Proportion in regard to Hooks and Thimbles, ſuppoſing a Gate to be a right-angled Parallelogram, ſet forth in Inches and twelfth Parts of Inches.

Diſtance from Thimble to Thimble.	"Horizontal Diſtance of Two perpendicular Lines, one falling from each of the Hooks."	Extra Length of lower Thimble.	Diſtance from Thimble to Thimble. In order to render theſe principles more evident, Mr. Parker has given the following figure and deſcription of the method of hanging gates: At *fig.* 14. is a ſection of two gate-poſts, with the proper poſition of the hinges of a gate, which is deſigned to open one way, diſplaying the line of faſtening, the line of reſt, and the line of equilibrium; which two laſt lines are in the ſame vertical plane, both with the hooks, and with the centre of the gate's gravitation; and at about 1-16th part of a circle within the line of equilibrium, a ſhort poſt is fixed in, to prevent the gate opening too near upon its equilibrium, and thereby becoming liable to be left open. *Fig.* 15. is the upper thimble for a common

gate, which is leſs expenſive, but by no means ſo good as when the ſtrap extends to the whole length of the gate, as deſcribed below; this thimble is twiſted 1-4th of an inch bearing towards the hanging-poſt. *Fig.* 16. is the lower thimble of a gate proportioned to the upper thimble *fig.* 15, as $1\frac{3}{4}$ inch is to 3 inches, in regard to the diſtance between their centres and ſhoulders reſpectively. Theſe thimbles are adapted for a gate whoſe hinges are 40 inches aſunder, and as 40 is to $1\frac{1}{4}$, the difference in this inſtance, ſo ſhould be any other diſtance from hinge to hinge, to the proportionate difference or extra length of the lower thimble; and the greater the extra length might be made, over and above ſuch proportion, the greater muſt become the velocity of the gate's fall, or tendency towards the line of reſt; until its courſe is arreſted by the faſtening-poſt 1-16th part of the circle, or 22° 30′ ſhort of the line of reſt. The lower thimble is let into the gate by a ſcrew of equal ſubſtance throughout its length, or not tapered, in order that the adjuſtment of the thimbles, as to the velocity of the gate's fall, may be regulated to ſo great a nicety as half a turn of the ſcrew: and the thimble may either be let into the heel of the gate, or lengthened out by a waſher, as occaſion ſhall require. The poſition of the thimbles, in reſpect to each other, muſt be favoured alſo by the lower thimble, which being placed 1-4th of an inch out of the middle of the heel of the gate, in the contrary direction of the upper thimble, the whole difference, as to the diſtances of the two thimbles from the hanging-poſt, will be one-half of an inch; and their vertical plane, which is the ſame as that of the lines of reſt and equilibrium, will form an angle with the line of faſtening of 22° 30′, or 1-16th part of a circle; this adjuſtment, in effect, adds 1-12th of an inch to the extra length of the lower thimble, ſo that, by a plumb-line, it will be found (when the gate is hung upright, as it always ought to be) that the actual extra length of the lower thimble, or horizontal diſtance of the two centres from each other, will be $1\frac{1}{4} + \frac{1}{12} = 1\frac{1}{3}$ inch. *Fig.* 17. is the upper hook. *Fig.* 18. is the lower hook, with key-hole and cotter, and is half an inch longer from its centre to the ſhoulder than the upper hook, in order to anſwer the thimbles; the actual poſition of the hooks, with reſpect to each other, or rather the horizontal diſtance of two perpendicular lines, one falling from the centre of each of the hooks, will be about $1\frac{1}{4}$ of an inch only; for if the hooks and thimbles are made to fit properly, each hook will then be more than 1-16th part of an inch ſmaller than its thimble; for as the whole loſs in hanging a gate need not be ſo much as 1-8th of an inch, or not more perhaps than 1-12th (which exactly balances what is gained in the thimbles), the extra length of the lower thimble before it is fixed to the gate, and that of the lower hook before it is driven into the poſt, ought preciſely to accord with the dimenſions expreſſed in the plate, ſuppoſing the diſtance of the two hinges to be 40 inches." And it is added, that "the diameter of the hooks ſhould be about 13-16ths of an inch, and the perforated parts of the thimbles, when made to fit ſuch hooks, will be about 14-16ths, that is, 7-8ths of an inch diameter: for pivots of this ſize, the above calculations are ſuited, as to the velocity of a gate's fall; and the thimbles ſhould be made of rounded iron, that the friction may be reduced by the ſmallneſs of the ſurface to be affected thereby: as is ſhewn by Mr. Vince's experiments "On the Motion of Bodies affected by Friction." Vol. LXXV. Philoſophical Tranſactions of the Royal Society of London. And when old iron-work is made uſe of, wherein a larger ſurface is expoſed to friction, 1-8th, or 1-4th of an inch, as may be ſufficient, added to the common extra length of the lower thimble, will be the readieſt means of counteracting the extra friction." But, "if the heel of a gate be not at right angles with the rail, or the perforated parts of the thimbles be greater than the proportion allowed for, the deficiency, in either or both caſes, muſt be ſupplied by adding to the length of the lower thimble.

"A complete gate for opening one way, and conſtructed in ſuch a manner, that it ſhall not ſink at the head, as ordinary gates are apt to do, is ſhewn at *fig.* 6. The bars are let into the middle parts of the head and heel, and the lacings are tapered for finiſhing upon a level ſurface with the heel, head, and rail; as is evident in the following directions for the ſawing out the timber, which ſhould be of *kind* oak, not too *tough*, and entirely free from ſap." But "the waſte in planing and finiſhing a gate may be allowed for or not, as the gate is deſired to be a little more or leſs ſtrong." But, "when the timber is good, it is reduced ſo little by being planed and finiſhed into a gate, that no allowance need be made for the waſte; or, at all events, if the ſawyer attends to the dimenſions recommended, the gate will be quite ſtrong enough for its ſize."

Parts of Gate.	Length.	Greateſt Thickneſs.	Tapered to.
	Feet. In.	In. by In.	In. by In.
Heel - -	4 4	$4\frac{1}{2}$—$3\frac{1}{2}$	
Head - -	4 4	$2\frac{1}{2}$—$2\frac{1}{2}$	
Rail - -	9 0	$3\frac{1}{2}$—$3\frac{1}{2}$	$2\frac{1}{2}$—$2\frac{1}{2}$
5 Bars - -	9 0	$3\frac{1}{2}$—1	$2\frac{1}{2}$—$\frac{3}{4}$
Diagonal lacing -	9 6	$3\frac{1}{2}$—$1\frac{1}{2}$	$2\frac{1}{2}$—1
Larger upright lacing	2 8	$3\frac{1}{4}$—$1\frac{1}{4}$	
Smaller ditto -	2 8	3 —$1\frac{1}{4}$	

which will be found to form a well proportioned gate, the whole of the eight parts at the head preſenting to the eye $2\frac{1}{2}$ inches, and ſeven out of the eight parts at the heel, that is, all excepting the heel itſelf, preſent $3\frac{1}{2}$ inches." And in it "the diagonal lacing is fitted into the heel by a ſtrong butment, even with the loweſt bar, and its ſmaller end meets the upper angle at the head, and is confined laterally by two upright lacings; this would keep up the rail, provided the head were not puſhed forward, and that is prevented by an iron ſtrap of equal length to the gate, being attached to, or forming a part of the upper thimble in the firſt inſtance, where it holds the heel of the gate by the ſhoulder of the thimble; it is afterwards ſcrewed to the rail at proper diſtances; and laſtly, ſecures the whole work together, by a ſcrew-nut, rounded and let into the front of the gate's head, as ſeen above. The iron ſtrap is about an inch by a quarter of an inch in ſubſtance, for one half of its length, when it is tapered towards the head of the gate. At the end neareſt to the thimble it is made ſtronger for a few inches; and cloſe to the ſhoulder of the thimble, it ſhould be as much as half of an inch thick; the edges are chamfered off, and the whole appears to be gradually tapered from the heel to the head of the gate, widening a little round the hole which is left for the upright part of the latch adjoining to the handle. By this arrangement, the gate is in fact ſuſpended by the iron ſtrap and rail, inſtead of the heel, which aſſiſts greatly in preventing any ſtrain upon the mortiſes by the gate's own weight, or otherwiſe." The writer ſays, he "cannot imagine a gate of a more durable conſtruction, and that it ſeems particularly well calculated for *road-gates*. As in reſpect to a field, through which there is no common road, it is immaterial what ſort of gates may be uſed, ſo that they be made ſecure againſt cattle."

In reſpect to the faſtening it is obſerved by the ſame writer, that moſt blackſmiths have favourite notions of theſe faſtenings, and that from their great variety, it is only neceſſary to conſider ſuch as have been found uſeful on trial. The faſtening, ſhewn at *fig.* 19, "is remarkably eaſy for a horſeman to open, and as difficult, if not impoſſible, to be opened by cattle: the upright wire of the latch is furniſhed with a guard, and the mortiſe of the head of the gate, through which the latch paſſes, is finiſhed with ſheet-iron eſcutcheons, like thoſe ſeen at *fig.* 22, the faſtening being completed with the catch 21, having a button in the place of the ring. *Fig.* 20. is a common peg-latch for the head of a gate, with a guard to render it ſafer for cattle, which might run againſt it when the gate is open; and this forms a very ſecure faſtening, either with or without the guard, when attached to the catch, *fig.* 21; but it is thought very inconvenient for horſemen, and particularly ſo for thoſe who are not accuſtomed to it. *Fig.* 21. is the catch adapted to the latch, *fig.* 22. *Fig.* 22. repreſents two ſheet-iron eſcutcheons, and a pattern for a ſtrong latch, which is executed in caſt-iron 3-4ths of an inch thick. *Fig.* 23. is the catch belonging to *fig.* 19, to be made alſo of caſt-iron, 1 inch thick. *Fig.* 24. is a haſp with a peg, of which the ſtud paſſes through the lower hole, but is too large to paſs the upper hole, and therefore cannot be detached from the haſp: this may be made very uſeful in the fold-yard, &c."

The author ſtates, that "the double drop catch, *fig.* 25, has been uſed for ſome time in parts of Shropſhire and Staffordſhire, and that he took no ſmall pains to improve it: he adapted it for fitting an angle of a poſt, of which *fig.* 26 is an horizontal ſection, and the ſcrew-pin in the centre is made to anſwer two purpoſes: that of attaching the iron work more firmly to the poſt, and alſo of returning the points of the drop catches as often as either of them is driven upwards by the latch, the catch being thus inſtantly repulſed into its former poſition, before the gate has time to recoil beyond it." It is ſuppoſed, that this "ſort of catch is calculated for a ſwing-gate, which, having been opened either way, falls to its line of reſt, but is prevented from paſſing it by the obſtruction of one of the catches; while the other catch giving way for the latch, drops again, and the gate is completely faſtened." And he "afterwards applied the ſame principle to a ſingle catch, for a gate to open only one way, *fig.* 27, in which he conceived that he had been very ſucceſsful.

"It was next to be determined what kind of latch was moſt proper for theſe catches, and he found that the beſt contrivances for baffling cattle were apt to puzzle his viſitors, whoſe convenience was entitled to a ſhare of his attention." He "at firſt tried an iron peg, *fig.* 28, to be driven into the head, oppoſite the top rail, for a road-gate, and when it was to be placed lower for a fold-yard, or common field-gate, to be faſtened with a ſcrew-nut, both of which are repreſented in the figure. He then found it neceſſary to add a handle to the drop, *fig.* 27, but his friends would ſtill inſiſt upon it that it was a two-handed faſtening, and very inconvenient for horſemen; he therefore ſoon diſcontinued the iron peg, in regard to the double catch, though he approves of it for ſome purpoſes." He thinks "it certainly never can be opened by cattle, and it would be eaſy enough for a horſeman to open, when he became acquainted with it; yet ſhould he take faſt hold of the handle of the catch with the fore part of the hand, as might be expected, in raiſing the drop, he will detach that hand from the gate, and he muſt then ſeek the aid of his other; though by placing the thumb or palm of the hand upon the drop-catch, and reſerving the full liberty of his fingers, he may open the gate very well with one hand; but when the catch is upon the contrary ſide of the gate to that of the horſeman, it will not be quite ſo convenient, for the fingers or fore-part of the hand muſt in that caſe be employed upon the catch, while the thumb opens the gate. A great advantage may be gained by having the iron peg guarded, as repreſented at *figs.* 29 and 30, which will remove the objection to its being in any way dangerous; and while it facilitates the opening of the gate with one hand, it throws a freſh difficulty in the way of cattle."

But "the iron-peg latch would not, however, anſwer for the ſwing-gate, and he has ſupplied its place by the jointed latch A, in *fig.* 6, the principle of which is not uncommon; the part O forms a moſt complete guard to the latch, and the handle, being a ſemicircular ring, reſts upon the upper bar of the gate, or upon the ſecond bar, making it extremely improbable that a cow or horſe could ever lift up a latch of this kind." But that "for a ſwing-gate the latch ſhould be placed as nearly as poſſible to the middle part of the head, that the gate may the better reſiſt the jar of its ſhutting; for the ſudden check which the drop-catches give to a ſwing-gate, is greater than what is found in ordinary faſtenings; and if the latch were placed towards the top of the head of the gate, it would be as deſtructive as the common manner of hanging ſingle gates."

After "having finiſhed his drop-catches, a friend aſſured him, that he had ſeen both ſingle and double catches in Suffolk upon the ſame principle, and at his requeſt he procured him a very good ſketch of them, and alſo a ſort of model: as far as he could judge from the drawings of the Suffolk catches, they ſeemed rather to have the advantage of thoſe which he had firſt ſeen in Shropſhire." But, "in the courſe of an extenſive tour he made, he took occaſion to obſerve, that however generally good methods of hanging and faſtening gates might be underſtood, they were very rarely practiſed; and he cannot help particularly noticing the gates acroſs the public roads in Dorſetſhire, which are very numerous, in ſupport of his aſſertion: and ſhould theſe hints ever find their way ſo far, he hopes that public as well as private convenience, in ſuch reſpect, may thereby be promoted. He ſaw a catch, ſimilar to *fig.* 31, in Devonſhire, and the latch uſed with it was a kind of iron peg nailed to the inner ſide of the top rail of the gate; but there is an objection, he thinks, to any catch receiving the latch above the pivot upon which the catch turns: ſuch a faſtening, if the gate ſinks but very little, will gradually become uſeleſs, which gives an undoubted preference to the other drop-catches; as with them a gate muſt ſink two inches (which one that is well hung never ought to do) before the catch will ceaſe to act.

"It is very material, he thinks, that the iron peg ſhould not reſt cloſe againſt the gate-poſt, as that would very much increaſe the difficulty complained of in opening a gate with theſe faſtenings; the middle part of the head of the gate, as to its thickneſs, is the fitteſt to receive the iron peg, whether it is to be placed high or low, and the play of the catch will be the ſame in all inſtances, provided its ſhouldering is adapted accordingly."

The writer ſtates that "the double catch, *fig.* 32, is uſed at this time in ſeveral parts of Shropſhire, with the latch adjoining it made to riſe upon a pivot. The hollow part of the latch is in ſhape and ſize like a table-ſpoon, with a hole drilled through it to prevent rain lodging there; a ſwing-gate with this faſtening is opened either by the hand preſſing down the hollow part of the latch, or on horſeback you may put a ſtick, or the butt end of a whip into it, and with only one exertion the gate may be thrown open; on

the return of the gate, the latch ſtrikes againſt the lower part of one of the catches, either of which will riſe upon its reſpective pivot, till obſtructed by an iron pin or ſtud, placed near the centre of the iron-work. Theſe drop-catches are thinner at their upper parts than they are downwards, which aſſiſts the latch in riſing clear of them; and when the gate is faſtened, the latch is at reſt between the two drop-catches. This is not a very eaſy faſtening to deſcribe, and might be proper to be more particular were it not for the preference due to other contrivances." He ſtates further, that "a guard muſt be adapted for ſuch a latch, or cattle would be likely to open it; but this faſtening is particularly liable to be out of order, either by the ſinking or the contraction of the gate: every objection might be more eaſily removed than the effects of the gate's ſinking, and to this he has made a ſlight improvement, as in the figure; that is, when the latch has ſunk lower than the catches, it will ſtrike againſt an inclined plane, and have a chance of riſing upon its pivot to overcome the obſtacle. But he has lately, he ſays, received a catch for a gate from Leiceſterſhire, which, though it poſſeſſes a great likeneſs to that at *fig.* 27, has one material advantage; that is, that it confines the latch when the gate is at reſt, by a full inch and a half within a narrower compaſs, or allows it ſo much leſs play, which was very deſirable. This pattern of a ſingle catch admitted of a ſmall improvement, and it was eaſily adapted alſo to a double catch: with reſpect to their uſe, what has been ſaid in regard to that at *fig.* 27, and thoſe at *figs.* 25 and 26, will properly apply to theſe catches. The ſingle catch is repreſented at *fig.* 33, and the double catches at *figs.* 34 and 35, which are entitled to a moſt decided preference, compared with any that he has ever met with. Beſides, the handle of the ſingle catch riſes almoſt perpendicularly, and therefere does not interfere with the hand in performing its double office of opening the gate, and holding up the catch at the ſame inſtant: whereas the handle of the catch, *fig.* 27, muſt be brought much forwarder in lifting it up than that of the catch *fig.* 33, and this, added to the difference in the play of the gate, will make altogether about three inches, which is a great deal in the ſpan of a hand." But, he obſerves, that "there is an objection which attaches equally to theſe kinds of catches, as to others, that they may eaſily be broken off a poſt, and carried away; and to obviate this, he confeſſes himſelf incompetent to adviſe any certain mode of ſecuring them; but he ſubmits that where ſuch depredations have been experienced, there will ingenuity moſt likely be found to counteract them." The writer concludes by obſerving, that "there are many inventions of ſpring catches and latches, the common ſorts of which are very liable to be out of repair, by being conſtantly expoſed to the weather, and that thoſe of a ſuperior kind are too expenſive for general purpoſes."

It may be uſeful to inſert, among theſe different ſorts of faſtenings, the repreſentation of a convenient mode of confining horſes to their ſituations in ſtable-yards or other places. This is ſeen at *fig.* 36, in the plate, and conſiſts of a hook and ring, by which they can be held by the halter or bridle, and which, though commonly known and employed in many places, cannot be too ſtrongly recommended: a ſtable-yard ſhould always be well furniſhed with ſuch hooks, to prevent the uſe of common nails, which are extremely dangerous; and one of them may occaſionally become an uſeful appendage to a gate or wicket.

There is alſo a haſp, ſuch as that ſeen at *fig.* 37, with a hook rivetted to it, that may be found uſeful for fold-yard gates, pig-ſties, dog-kennels, and other places of a ſimilar kind.

GATES, *Caſt-iron Hangings and Faſtenings for.*—The introduction of caſt-iron hinges and faſtenings for gates has been attempted, and not without ſucceſs, by Mr. Parker, by which the expence in ſuch caſes is greatly leſſened, and at the ſame time the durability of the articles vaſtly increaſed. It is remarked by him, "that not a ſingle inſtance of failure has come within his knowledge in this ſort of iron-work for gates," though it "has been purpoſely ſubmitted to the moſt ſevere teſts; and he has little doubt but that in reaſonable time the improvement will be generally adopted." It has, indeed, been found that faſtenings of this ſort are capable of reſiſting the ſtrongeſt horſe purpoſely rode againſt the gate; and the ſtouteſt man may throw the gate towards its falling-poſt with all his power, without injury to the caſt hangings. And further, that the ſaving to the public by the adopting of caſt iron, in compariſon with the beſt wrought iron work is, it is ſuppoſed, apparently more than ſixty, but in reality not leſs than fifty *per cent.* It is obſerved that the different patterns have been executed with great correctneſs, in fine mahogany, to the perfect ſatisfaction of the inventor, and that the caſtings are conſequently the ſame. It was therefore only neceſſary for their ſtrength to be fully demonſtrated; and that, this having been done, his deſign is completed. But ſhould the caſt iron-work in any caſe happen to be furniſhed from the foundery without being accurately fitted, it may be adjuſted by filing with the ſame facility that wrought iron work can be altered, or at leaſt with very little more difficulty.

The public have been undertaken to be ſerved with proper ſupplies of theſe caſt-iron hangings and faſtenings, by Meſſrs. Deerman, Francis, & Co. Eagle Foundery, Birmingham; the caſtings being completely finiſhed and fitted at the charge of $3\frac{3}{4}d.$ the pound. The quantity of two tons has been directed to be caſt without delay, and ſeveral hundred weights of caſtings already brought into uſe under the immediate advice of the inventor.

The following hints, or memoranda, are furniſhed with the view of affording a diſtinct method of giving orders for the caſt-iron work to thoſe gentlemen or other perſons who may wiſh to make a trial of it.

For the gate ſhewn at *fig.* 6, to which a head-ſtrap and ſtrap-thimble are adapted, of caſt iron, omitting the intermediate length of the nine-feet iron ſtrap, the directions may be for Mr. Parker's patterns, Nos. 1, 3, 4, 6, 7, 8, and 9, (the caſtings being emboſſed with numbers from 1 to 16), $17\frac{1}{2}lb.$, $5s.$ $7\frac{3}{4}d.$; a pair of ſheet-iron eſcutcheons, $2d.$; No. 9 is the jointed latch formed in three pieces: 12 two-inch wood ſcrews, 4 one and a half inch ditto, and 16 two-penny clout-nails are likewiſe neceſſary to complete the whole.

But for a common ready made gate, having a ſtrong top-rail for the ſtrap-thimble, Nos. 1, 3, 4, 5, 6, and 7, $15lb.$ $4s.$ $8\frac{1}{4}d.$ are only required; with 12 two-inch ſcrews, and two one and a half inch ditto. And for a common gate, not having a ſtrong top-rail for the ſtrap-thimble, Nos. 1, 2, 3, 4, 5, and 6, $13lb.$ $4s.$ $0\frac{3}{4}d.$, are merely requiſite. The coſt of a complete ſet of ſpecimens, being ſixteen in number, which forms ſets for every purpoſe, including ſwing-gates, $41lb.$, is $12s.$ $9\frac{3}{4}d.$

It is ſtated, in addition, that the ſhapes of the ſeveral pieces of caſt-iron work will point out the manner in which they are reſpectively to be attached to the gates in ordinary caſes.

GATE, in *Engineery*, is applied to the cloſe-boarded doors of locks or ſluices on canals or rivers, for penning the water: in a lock theſe are diſtinguiſhed by upper-gates and lower-gates, according as they are placed at the head or tail of the lock. See CANAL.

GATE, or *Gait*, in the *Manege*, called in French *train*, is uſed for the going or pace of a horſe.

GATE, in a *Military Senſe*, is made of ſtrong planks, with iron bars, to oppoſe an enemy. They are generally made in the middle of the curtin, from whence they are ſeen, and defended by the two flanks of the baſtion. They ſhould be covered with a good ravelin, that they may not be ſeen or enfiladed by the enemy. Theſe gates, belonging to a fortified place, are paſſages through the rampart, which may be ſhut or opened by means of doors and a portcullis. They are either private or public.

Private gates are thoſe paſſages by which the troops can go out of the town unſeen by the enemy, when they paſs to and from the relief of the duty in the outworks, or on any other occaſion which is to be concealed from the beſiegers.

Public gates are thoſe paſſages through the middle of ſuch curtins, to which the great roads or public ways lead. The dimenſions of theſe are uſually about thirteen or fourteen feet high, and nine or ten feet wide, continued through the rampart, with proper receſſes for foot paſſengers to ſtand in out of the way of wheel-carriages. The front of the gate-way on the outſide is commonly ornamented with architecture either of the Tuſcan or Doric order: and over the vault, which covers the paſſage, cloſe to the town wall, is erected a building of about eighteen or twenty feet ſquare, in which the portcullis is ſuſpended; and on the inſide of the rampart there is generally another building, of about a hundred feet in front, and thirty deep, and high enough to contain one or two floors of rooms for one of the town officers; the ground floor ſerving for guard-rooms for the troops on duty at the gate. See HARROW, HERSE, ORGAN, and PORTCULLIS.

GATE, in *Mining*, ſignifies a paſſage or gangway underground, uſed by the minors. Drift, audit, gallery, augle, tunnel, brough, ſough, &c. are words of nearly ſimilar import.

GATE, *Poſtern*. See SALLY-*port*.

GATE *of the Sea*, or a *Sea-gate*, is uſed when two ſhips lie aboard one another in a wave or billow, and by that means ſometimes become rib-broken.

GATE, in *Scripture Language*, is uſed to denote the place of public aſſemblies, where juſtice was adminiſtered. (Deut. xvii. 5, 8. xxv. 6, 7. xxi. 18, 19. xxii. 15, &c.) As the Jews moſtly laboured in the fields, aſſemblies were held at the city-gates, and juſtice was adminiſtered there, that labourers, who ought to follow their work, might loſe no time, and that the country people, who required juſtice, might not be obliged to enter the town. Accordingly, the lower courts of juſtice, in the ſeveral cities, were held in their gates: thus we read, "judges and officers ſhalt thou make in all thy gates." (Deut. xvi. 18.) So that the gate among the Hebrews ſeems to have correſponded to the "forum" among the Romans, and to the αγορα among the Greeks; which was the name given to any common place of reſort, whether for the keeping of markets, or the holding courts of judicature. In the former ſenſe, the word, gate, is uſed, when Eliſha foretells at what low rate proviſions would be ſold, on the morrow, in the gate of Samaria. (2 Kings, vii. 1) In the latter ſenſe, Iſrael is exhorted to "execute the judgment of truth and peace in her gates." (Zech. viii. 16.) In either ſenſe, that is, as denoting, in general, a place of public concourſe, the word is uſed, when it is ſaid of the virtuous woman, "Give her of the fruit of her hands, and let her own works praiſe her in the gates." Prov. xxxi. 31.

Hence *gate*, *porta*, ſometimes ſignifies power and dominion: and in a ſimilar ſenſe the Turkiſh emperor's palace is called the *Porte*. Thus, God promiſes Abraham, that his poſterity ſhall poſſeſs the gates of their enemies, their towns and fortreſſes. (Gen. xxii. 17.) Our Saviour ſays to Peter, "Thou art Peter, and upon this rock will I build my church, and the gates of hell, or Ades, ſhall not prevail againſt it." Matt. xvi. 18. See alſo Iſaiah, xxxviii. 10. Pſ. ix. 13. cvii. 18. See ADES.

GATES, *Opening of*, in *Aſtrology*. See OPENING.

GATEHOUSE *of Fleet*, in *Geography*, a town of Scotland, in the county of Kircudbright, ſituated near the mouth of the Fleet, not far from the Iriſh ſea, with a cotton manufacture. Sloops come near the town; 13 miles W. of Kircudbright.

GATEL, a town on the eaſt coaſt of Mindanao. N. lat. 7° 52'. E. long. 126° 18'.

GATERINA, in *Ornithology*, a ſpecies of *Sciæna*; which ſee.

GATES, in *Geography*, a county of America, in Edinton eaſtern diſtrict, North Carolina, bounded north by the ſtate of Virginia, and ſouth by Chowan county. It contains 5881 inhabitants, including 2688 ſlaves; 280 miles from Waſhington. The chief town is Hertford.

GATESHEAD, a borough and pariſh in the ward of Cheſter, and county palatine of Durham, England. The town is built on the ſide of a hill, which ſlopes to the north, where it is bounded by the river Tyne; over which is a ſtone bridge, with an iron gate in the centre, ſeparating the reſpective boundaries and juriſdiction of Gateſhead and Newcaſtle. By a charter granted by biſhop Pudſey in 1164 to "his burgeſſes of Gateſhead," it is provided, that "each ſhall have, in right of his burgage, ſimilar liberties to thoſe enjoyed by the burgeſſes of Newcaſtle, in right of their burgages; and that they ſhall have free paſſage within the liberties of the palatinate with their goods, clear of all dues and exactions." Several ſucceeding prelates had their keepers of the park and caſtle here. In 1557, biſhop Tunſtall granted a charter to the company of Glovers, within the borough of Gateſhead; in 1602, biſhop Matthew incorporated ſundry trades; and in 1661, biſhop Coſin conſtituted them one commonalty. In the reign of Edward VI. this borough was united to Newcaſtle; but in the ſucceeding reign it was reſtored to the ſee of Durham, &c. Previous to the former event, it appears, from "Strype's Annals," that the mayor and burgeſſes of the latter place purchaſed from Thomas Sutton, founder of the Charter-houſe in London, for 12,000*l*. "the manor of Gateſhead, with all the manors, coal-pits, and coal-mines in Gateſhead and Wickham, with the common waſtes, &c." The trade of this place is not very extenſive: it, however, poſſeſſes ſeveral manufactories, particularly of caſt and wrought iron, whiting, &c. The population was ſtated in the late returns at 8597, inhabiting 1101 houſes.

On the eaſt ſide of the chief ſtreet, about half a mile from the bridge, are the ruins of St. Edmund's hoſpital, or monaſtery, ſuppoſed to occupy the ſcite of a monaſtery which appears, from Bede, to have been eſtabliſhed previous to the year 653.

On Gateſhead Fell, a bleak and elevated ridge, extending ſouthward from the village, a victory was obtained, in the year 1068, by William the Conqueror, over the combined forces of Edgar Atheling, and Malcolm, king of Scotland. Brand's Hiſtory of Newcaſtle, 2 vols. 4to.

GATEWAY, in *Rural Economy*, a paſſage, or opening into an incloſure, which is uſually cloſed by a gate. The ſpace for a gateway ſhould be from eight to nine feet, in general; but a greater width is, in ſome caſes, requiſite.

The

The foundations of gateways ſhould always be well laid with ſome ſolid material of the ſtone kind.

GATH, in *Ancient Geography*, a city of the Philiſtines, one of their five ſatrapies, or principalities, (1 Sam. vi. 17.) which were ſituated along the Mediterranean coaſt, between that and the tribes of Simeon, Dan, and part of Benjamin, extending from the ſea-port of Jamnia to the mouth of the river Bezor. Gath, or Geth, was famous as the birth-place of Goliath; it was firſt conquered by David, (1 Sam. xvii. 4.) and continued ſubject to his ſucceſſors till the declenſion of the kingdom of Judah. (2 Sam. viii. 1.) It was rebuilt and fortified by Rehoboam (2 Chron. xi. 8.): and retaken by Uzziah and Hezekiah. It was ſituated about five or ſix miles S. of Jamnia, about 14 S. of Joppa, and 32 W. of Jeruſalem. Gath was the moſt ſouthern city of the Philiſtines, as Ekron, or Accaron, was the moſt northern; ſo that Ekron and Gath are placed as the boundaries of their land. (1 Sam. vii. 1. 4. xvii. 52.) Jerom places Gath on the road from Eleutheropolis to Gaza. It recovered its liberty and luſtre, ſo as to be a place of ſtrength, in the time of the prophets Amos and Micah, independent of the kings of Judah (Amos, vi. 2. Micah, i. 20, &c.); but it was afterwards demoliſhed by Hazael, king of Syria. After that period, it remained of little conſideration till the time of the holy war, when Fulk, king of Jeruſalem, built a caſtle on its ruins.

GATH-*Opher*, or GATH-*Epher*, a town in the diſtrict of Opher, in Galilee, the birth-place of the prophet Jonah (2 Kings, xiv. 25.); placed by Joſhua (xix. 13.) in Zebulun. Jerom, in his preface on Jonah, ſays, that it was two miles from Sephoris, or Diocæſarea.

GATH-*Rimmon*, a city belonging to Dan (Joſh. xix. 45.); placed by Jerom 10 miles from Dioſpolis, towards Eleutheropolis: it was given to the Korathites.—Alſo, a city in the half-tribe of Manaſſeh, on this ſide of Jordan; given to the Korathites. (Joſh. xxi. 25.)—Alſo, a city of Ephraim; given to the Korathites. 1 Chron. vi. 69.

GATHEÆ, a town of the Peloponneſus, in Arcadia, according to Pauſanias.

GATHEATES, a ſmall river of Arcadia, in the ſouthern part, which ran from ſouth to north, and having received the Carnion, diſcharged itſelf into the Alpheus, over-againſt Megalopolis.

GATHER, in the *Sea Language*. A ſhip is ſaid to gather on another, when ſhe gets the wind of her.

GATHERING, in *Rural Economy*, is a term applied to the proceſs of rolling corn-ſwaths into a kind of cocks, or heaps. It alſo ſignifies a particular method of ploughing. See PLOUGHING.

GATINGOLY, in *Geography*, a town on the eaſt coaſt of Celebes. N. lat. 0° 22′. E. long. 123° 46′.

GATINOIS, or GASTINOIS, a province of France before the revolution. In the 11th century it had courts of its own, and was afterwards joined to Anjou. In later times it has partly belonged to the government of Orleans, and partly to the government of the iſle of France, and was diſtinguiſhed by the names of "Gatinois Orleanois," and "Gatinois François." It now forms part of the departments of the Seine and Marne, Seine and Oiſe, and Loiret.

GATO, a ſmall iſland in the Eaſt Indian ſea; 12 miles N. of Sibu. N. lat. 11° 42′. E. long. 123° 36.

GATRON, or KATTRON, a town of Africa, in Fezzan; 40 miles S. of Mourzouk.

GATSCH, a town and caſtle of Hungary; 12 miles E. of Korpona.

GATSEELA, a town of Bengal; 46 miles W. of Midnapour.

GATT, a ſtrait between the Friſch Haff and the German ſea.

GATTAIR, in *Ornithology*, a ſpecies of *Anas*. See DUCK.

GATTAN, in *Geography*, a town of Hindooſtan, in Allahabad; 10 miles north of Jionpour.

GATTAR, or KATTAR, a ſea-port of Arabia, in the province of Lachſa, on the Perſian gulf, oppoſite to Bahhrein; 40 miles S. of El-Catif.

GATTINARO, a town of France, in the department of the Seſia, on the Seſia; 15 miles N. of Vercelli.

GATTO, CAPE, or *Cape Gæta*, a cape on the S. coaſt of the iſland of Cyprus, probably the "promontorium phrurium" of the ancients. The land is low, the north and weſt parts of it being a moraſs, and on the eaſt ſide is a large ſalt lake, which is filled by the rains in winter, and is almoſt dry in ſummer. The ſouth part is a barren rocky ſoil, on which is a ruinous uninhabited convent, called "St. Nicholas." N. lat. 34° 32′. E. long. 33° 8′.

GATTON. See AGATTON.

GATTON, a borough town in the county of Surry, England, has been formerly a place of ſome extent and conſequence; but is reduced to 18 houſes, and 112 inhabitants. A privileged few of theſe, about ſeven, ſend two members to parliament. This place, "like its neighbours Rhiegate and Blechingley," ſays Mr. Gough, "owes its ruin to the *honor* of being repreſented in parliament. It had once a caſtle, ſucceeded by the manor-houſe." This is a modern edifice, ſeated in a fine park, which abounds with plantations, and is ornamented with a lake of about forty acres. The river Mole riſes in this pariſh.

GATTORUGINE, in *Ichthyology*, a ſpecies of *Blennius*, with palmated ſmall fins at the eye-brows and nape; or, as Artedi deſcribes it, with two ſmall fins at the eyes, and the anal fin conſiſting of 23 ſmall bones. It inhabits the Mediterranean and Atlantic ſeas. Pennant deſcribes a fiſh of this ſpecies, which was found on the Angleſea coaſt. Its length was $7\frac{1}{2}$ inches; the body ſmooth and compreſſed on the ſides; the belly a little prominent, and the vent, like that of the creſted blenny, or "galerita," placed under the ends of the pectoral fins. The teeth ſlender, almoſt ſetaceous and very cloſe-ſet; between the eyes was a ſmall hollow, and above each, juſt on the ſummit, was a narrow looſe membrane, trifurcated at the top, which diſtinguiſhes this from all other ſpecies. The pectoral fins broad and rounded, conſiſting of 14 rays; the ventral fins like thoſe of others of the genus; the dorſal fin conſiſting of 14 ſtrong ſpiny rays, and 19 ſoft rays; the anal fin having 21 rays; the tail rounded at the end, and conſiſting of 12 rays, divided towards their extremities. This fiſh in general was of a duſky hue, marked acroſs with wavy lines; the belly of a light aſh-colour; the lower part of the pectoral fins, and the ends of the ventral fins, of an orange colour.

GAU, GAW, *Gou*, or *Gow*, a termination in the German language, ſignifying country, canton, or diſtrict.

GAU *Scherkie*, in *Geography*, a town of Egypt, on the right bank of the Nile, oppoſite to Tahta, ſuppoſed by Norden to be the ancient Dioſpolis. In this town is a temple, 60 paces in length and 40 in breadth, ſeemingly covered by a ſingle ſtone reſting upon columns. The roof is well preſerved; and it is uſed by the Arabs as a lodgment for their cattle.

GAVALI, in the *Materia Medica*, a name given by ſome of the old writers to bdellium, particularly to the Arabian kind, which was the pureſt, and was uſually in form of ſmall tears, and of a pale yelloviſh colour.

GAVALS,

GAVALS, in *Geography*, a town of Ruſſia, in the government of Wiburg; 28 miles S. of it.

GAVAREEA, Cape, a cape on the eaſt coaſt of Kamtſchatka. N. lat. 52° 4′. E. long. 158° 31′.

GAUBIL, Anthony, in *Biography*, was born at Caillac in 1708, and was educated among the Jeſuits, into whoſe order he entered. By them he was ſent a miſſionary to China, where he paſſed thirty-ſix years, during which he obtained a knowledge of the Chineſe hiſtory and literature, which ſurprized the learned natives themſelves. He publiſhed ſeveral hiſtorical works, which were chiefly tranſlations from the Chineſe language. He died in 1759, having done much in ſupporting, by his aſtronomical knowledge, and general ſcience, that reſpectability which the Jeſuits had maintained above all other learned European orders. Nouv. Dict. Hiſt.

GAUBIUS, Jerome David, was a pupil of the learned Boerhaave, and became himſelf a profeſſor of medicine in the univerſity of Leyden, where he took the degree of doctor in 1725. He left ſeveral works of conſiderable value, which would not have diſcredited his maſter.—1. "Diſſertatio Inauguralis de ſolidis humani corporis partibus," Leyden, 1725.—2. "Libellus de methodo concinnandi formulas medicamentorum," ibidem, 1739, 1767. Franckfort, 1750, and in French, Paris, 1749.—3. "De regimine Mentis, quod Medicorum eſt," Leyden, 1747, 1763. In this work he deſcribes the effects reſulting from the empire of the body over the mind.—4. "Inſtitutiones Pathologiæ Medicinalis," ibid. 1758. This work alſo paſſed through ſeveral editions and tranſlations.—5. "Adverſariorum varii argumenti Liber unus," ibid. 1771. Eloy.

GAUDEN, or Gawding, John, in *Biography*, an Engliſh prelate, was born in the year 1605, at Mayland in Eſſex. He received the elementary parts of his education at Bury St. Edmund's, and at the age of ſixteen he was ſent to St. John's college, Cambridge. About 1630 he married a daughter of ſir William Ruſſel, and removing to Oxford became a member of Wadham college, where two of his wife's brothers were put under his care, and afterwards ſome other young perſons of conſiderable rank in life. In 1635 he took his degree of bachelor of divinity, and was afterwards appointed chaplain to the earl of Warwick. His patron's politics being in direct oppoſition to thoſe of the court, his chaplain embraced the ſame ſide, and preached a ſermon before the houſe of commons, in November 1640, which was ſo highly approved by that body, that they voted him a preſent of a large ſilver tankard, with an honorary inſcription upon it. In 1641 he took his degree of D. D. and was preſented by the parliament to the deanery of Bocking in Eſſex, which valuable preferment was confirmed to him by archbiſhop Laud, then a priſoner in the Tower. During the civil wars, and when the Preſbyterian form of church government and worſhip were eſtabliſhed, Dr. Gauden conformed, and preſerved his livings; and in 1643, he was appointed one of the "aſſembly of divines," but his name was afterwards ſtruck off the liſt, as he was ſuſpected of an attachment towards epiſcopacy. In 1648, his principles were more openly declared, for when the army had aſſumed the ſovereign power, and were determined to impeach, and bring to trial the unfortunate and miſguided Charles, Dr. Gauden inſiſted upon the unlawfulneſs of ſuch a meaſure, and publiſhed his proteſtation againſt their meaſures, which, as the title of the work imports, he cauſed to be preſented to the lord Fairfax, and his general council of officers. In the ſame year he wrote, but without venturing to publiſh, "a juſt invective againſt thoſe of the army and their abettors who murdered king Charles I.," with ſome poetic pieces in Latin, referring to thoſe tragical times. During the ſame year likewiſe the celebrated treatiſe entitled "Εικων βασιλικη, or portraiture of his ſacred majeſty in his ſolitude and ſufferings" was firſt printed, and in a few months it had paſſed through ſeventeen editions in England. Dr. Gauden, it is generally admitted, had a principal ſhare in this work, if he were not the ſole author, but fortunately the ſuſpicion of it did not light on him till epiſcopacy was re-eſtabliſhed. He was author of ſome other pieces which muſt have been obnoxious to the ruling party, nevertheleſs he continued unmoleſted till monarchy and epiſcopacy were again reſtored, when his zeal was rewarded by preferment in that church, for which, in the times of its affliction, he had been an advocate. He was appointed preacher at the Temple in the year 1659, and in the following year made chaplain to his majeſty Charles II. He now devoted his talents to vindicate the meaſures of the court, and to juſtify the cauſe of the hierarchy againſt ſectaries; and for his various ſervices, of which, it is ſaid, he frequently reminded the king, he was, in 1660, promoted to the vacant ſee of Exeter, which proved a moſt lucrative ſituation; for, from the fines for the renewal of leaſes, which had not been levied during the abolition of epiſcopacy, in a few months he realized the ſum of twenty thouſand pounds. In 1662, he was tranſlated to the ſee of Worceſter, but he had hoped for the more valuable biſhopric of Wincheſter, which was given to Dr. Morley, the late prelate of Worceſter. This diſappointment of his ambition he could not brook, his pride was mortified, he was taken ill very ſoon after his removal to the new ſee, and died in the fifty-ſeventh year of his age. His character has been variouſly eſtimated. Wood ſpeaks of him as "eſteemed by all who knew him, and as one who was much reſorted to, for his admirable way of preaching." Kennet repreſents him as capable of underwork, as a tool to the court, by the moſt ſordid hopes of greater favour in it; and Charles II. is reported to have ſaid, on hearing of his death, "I doubt not it will be eaſy to find a more worthy perſon to fill his place." By others he is repreſented as inconſtant, ambiguous, luke-warm, vain, ambitious, covetous of preferment, and impatient in the purſuit of it. Biog. Brit.

GAUDENS, St., in *Geography*, a town of France, and, principal place of a diſtrict, in the department of the Upper Garonne, ſeated on the Garonne. The place contains 4,055, and the canton 14,943 inhabitants, on a territory of 190 kiliometres, in 22 communes; 44 miles S.S.W. of Toulouſe. N. lat. 43° 6. E. long. 0° 48′.

GAUDENTIUS, in *Biography*, a ſaint in the Roman calendar, and biſhop of Breſcia, who flouriſhed in the fourth and fifth centuries. He was elected to the ſee of Breſcia in the year 387, which happened during his abſence on a religious viſit to the Eaſt. When he was informed of the choice which had fallen upon him, his diffidence was ſo great that he felt extremely averſe from undertaking ſo weighty a charge, and purpoſely delayed his return to Italy, under the hope that ſome other perſon might be appointed in his ſtead. Deputies were ſent to him to urge his ſpeedy compliance with their wiſhes, and to requeſt of the eaſtern biſhops, that Gaudentius might not be admitted to their communion, if he ſhould refuſe to return to his own dioceſe. Finding them determined upon his acceptance of the new appointment, he returned without farther delay. In 404 he was ſent with a deputation to Conſtantinople, by the emperor Honorius and the weſtern biſhops, to appeaſe the emperor Arcadius's reſentment againſt St. Chryſoſtom, and to intercede for his peaceable re-eſtabliſhment in the ſee. It

is not known how long this biſhop lived; ſome biographers mention his death as having happened in 410, and others in 427. He was author of ſeveral works, and of letters and other pieces, which are inſerted in the fifth volume of the "Bibliotheca Patrum." The moſt complete edition of his works was publiſhed at Breſcia in the year 1738, with thoſe of Philaſter, the life of whom has been attributed to Gaudentius. His ſtyle is plain, but defective in the ſtrength, eloquence, beauty, and correctneſs which diſtinguiſh the writings of many of his contemporaries. Moreri. Gen. Biog.

GAUDENTIUS *the Philoſopher*, one of the ſeven Greek writers on muſic, collected and publiſhed by Meibomius 1652, with a Latin tranſlation and commentary. We can find no very ſatisfactory information concerning this writer's country, or the time when he flouriſhed. Fabricius, Bibl. Græc. lib. iii. cap. x. ſeems to think that he preceded Ptolemy; but being a follower of the doctrines of Ariſtoxenus, he compoſed an introduction to harmonics, which Caſſiodorus has twice celebrated as an elegant little work; though he neither tells us when nor where he lived. However, on his authority, Caſſiodorus relates, that Pythagoras diſcovered the original precepts of the art, by the beating of hammers, and the percuſſion of tuneful ſounds; and concerning this tradition, Gaudentius is very explicit. His work, however, in general, except a few definitions, and a repreſentation of the muſical characters after the manner of Alypius, is little more than an abridgment of Ariſtoxenus, and that ſo ſhort and obſcure, that little knowledge is to be acquired by its peruſal.

GAUDIANO, in *Geography*, a town of Naples, in the province of Baſilicata; 10 miles N. E. of Venoſa.

GAUDIES, old Fr. jovial, riotous tunes.

GAUDIO MELL. FIAMINGO, in *Biography*, a Fleming, ſaid by the Italians to have been the maſter of the venerable Paleſtrina, by whom they mean CLAUDE GOUDIMEL; ſee that article.

GAUDISCHKAHN, in *Geography*, a town of Pruſſian Lithuania, ſituated on the Angerap; five miles E. S. E. of Gumbinnen.

GAUDKE, a town of Pruſſia, in the circle of Samland; eight miles N. of Pillau.

GAUDMA. See BOODH and GODAMA.

GAVE, a term uſed in the S. W. part of France, to expreſs a river or brook, as the gave of Oleron &c.

GAVEL, a term provincially uſed to ſignify a row or ſwath of corn, which has been cut down with the ſcythe. It alſo ſignifies ground.

GAVEL, or *Gabel*, in *Law*, ſignifies tribute, toll, cuſtom, yearly rent, payment, or revenue, of which there were anciently ſeveral kinds; *gavel-corn*, *gavel-malt*, *out-gavel*, *gavel-fodder*, &c.

GAVEL is ſometimes alſo uſed for what we more uſually call the *gable*; which ſee.

GAVELCESTER, *Sextarius Vectigalis*, a certain meaſure of rent ale. Among the articles to be charged on the ſtewards and bailiffs of the manors belonging to the church of Canterbury in Kent, according to which they were to be accountable, this of old was one: "de gavelceſter cujuſlibet bracini braciati infra libertatem maneriorum, *viz.* Unam logenam & dimidiam cereviſiæ." This duty elſewhere occurs under the name of *tolceſter*, in lieu whereof, the abbot of Abingdon was wont of cuſtom to receive the penny mentioned by Selden, in his Diſſertation annexed to Fleta, c. 8. Nor does it differ from what is called *oakgavel* in the gloſſary at the end of the laws of Henry I.

GAVELET, GAVELETUM, in *Law*, a ſpecial and ancient kind of *ceſſavit* uſed in Kent, where the cuſtom of gavel-kind continues; whereby the tenant ſhall forfeit his lands and tenements to the lord, if he withdraw from him his due rents and ſervices.

The proceſs of the gavelet is thus: the lord is firſt to ſeek by the ſteward of his court, from three weeks to three weeks, to find ſome diſtreſs upon the tenant, till the fourth court; and if, at that time, he find none, at this fourth court it is awarded, that he take the tenement in his hand, in name of a diſtreſs, and keep it a year and a day without manuring; within which time, if the tenant pay his arrears, and make reaſonable amends for the with-holding, he ſhall have and enjoy his tenement as before; if he come not before the year and day be paſt, the lord is to go to the next county court, with witneſſes of what had paſſed at his own court, and pronounce there his proceſs to have farther witneſſes; and then, by the award of his own court, he ſhall enter and manure the tenement as his own; ſo that, if the tenant deſire afterwards to have and hold it as before, he muſt agree with the lord, according to this old ſaying: "has he not ſince any thing given, or any thing paid, then let him pay five pound for his were, ere he become healder again." Other copies have the latter part with ſome variations: "let him nine times pay, and nine times repay."

The word gavelet, in its original ſignification, imported rent; but it means alſo a proceſs for the recovery of rent peculiar to Kent, and London. The gavelet, thus prevailing by the cuſtom of Kent, may be uſed whether there be a ſufficient diſtreſs on the land or not; but is reſtricted to gavel-kind tenure. This remedy of gavelet, as well as that of *ceſſavit*, is now wholly fallen into diſuſe; nor, whilſt they continued in uſe, were they applicable, except where the tenure was in fee. Booth on Kent Act. 133. 1 Inſt. 142. n. 2.

GAVELET, in London, a writ uſed in the huſtings of London, "Breve de gaveleto in London, pro reditu ibidem quia tenementa fuerunt indiſtringibilia." And the ſtatute of gavelet, 10 Edw. II. gives this writ to lords of rents in the city of London as well as in Kent. Here the parties, tenant and demandant, appear by *ſcire facias*, to ſhew cauſe why the one ſhould not have his tenement again, on payment of his rent, or the other recover the lands, on default thereof.

GAVEL-GELD, denoted payment of tribute or toll. Mon. Angl. tom. 3.

GAVEL-KIND, a tenure or cuſtom, annexed and belonging to lands in Kent, whereby the lands of the father are equally divided, at his death, among all his ſons; or the lands of the brother among all the brethren, if he have no iſſue of his own. Lit. 210.

Lambard compounds this term of the three Saxon words *gyfe*, *eal*, *kyn*, *omnibus cognatione proximis data*. Verſtegan calls it *gavelkind*, quaſi *give all kind*, *i. e.* to each child his part; and Taylor, in his Hiſtory of Gavel-kind, derives it from the Britiſh *gavel*, *i. e.* a hold or tenure, and *cenned*, or *cenedl*, *generatio*, or *familia*; and thus *gavel cenedl* might ſignify *tenura generationis*.

"Teutonicis priſcis patrios ſuccedit in agros
Maſcula ſtirps omnis, ne foret ulla potens."

This cuſtom anciently obtained throughout England, before the year 1066; but after the conqueſt, when knight-ſervice was introduced, the deſcent was reſtrained to the eldeſt ſon for the preſervation of the tenure. (Lamb. 167. 3 Salk. 129.) But it is ſtill of force in a great part of Kent, Urchenfield in Herefordſhire, and elſewhere, though with ſome difference: but, by the ſtat. 34 and 35 Hen.

Hen. VIII. c. 26. all gavel-kind lands in Wales are made deſcendible to the heir, according to the courſe of common law; whereby it appears, that this tenure was alſo in that principality; and was probably of Britiſh original.

In an ancient book of records in Chriſt-church, Canterbury, of the time of Henry VIII. our Saxon anceſtors are ſaid to have held all their lands either by writing, or without; the firſt were called *bockland*, whoſe owners were men, whom we now call *freeholders*: the ſecond were called *folkland*, the owners whereof were of ſervile condition, and poſſeſſed *ad voluntatem domini*. Now the inheritance, or freehold, did not, in thoſe days, deſcend to the eldeſt ſon, but to all alike; which, in Saxon, was called *landeſcyftan*; and, in Kent, to *ſhift land*; whence came the cuſtom gavelkind. And the reaſon why it was retained in Kent more than other places was, that the people of Kent, upon the Norman invaſion, could not be induced to ſurrender to the conqueror, but on theſe conditions, that they ſhould retain their ancient county-cuſtoms without any infringement or diminution; and eſpecially that called *gavelkind*.

Blount, in v. *Gavelkind*, relates a ſtory of the Kentiſh men ſurrounding Will. I. with a moving wood of boughs, and thus obtaining a confirmation of their ancient rights.

In the reign of Hen. VI. there were not above thirty or forty perſons in the whole county of Kent, who held by any other tenure than this of gavel-kind; which was afterwards altered upon the petition of ſeveral Kentiſh gentlemen, with regard to great part of the land of that county, ſo as to be deſcendible to the eldeſt ſon, according to the courſe of common law; by 31 Hen. VIII. c. 3.: though the cuſtom to deviſe gavel-kind land ſtill remains; and all lands in Kent ſhall be taken to be gavel-kind, except thoſe which are *diſgavelled* by particular ſtatutes. (Co. Lit. 140.) Blackſtone relies on the nature of tenure in gavel-kind, as a pregnant proof that tenure in free ſocage was a remnant of Saxon liberty. It is well known that the Kentiſh men vigorouſly ſtruggled to preſerve their ancient liberties, and theſe ſtruggles were attended with ſucceſs. And as it is principally in Kent that we find the cuſtom of gavelkind, we may fairly conclude that this was a part of thoſe liberties; agreeably to Mr. Selden's opinion, that gavel-kind, before the Norman conqueſt, was the general cuſtom of the realm.

The diſtinguiſhing properties of this tenure are various; ſome of the principal are theſe: the lands, held under this denomination of *gavel-kind*, which is an ancient ſocage tenure, deſcend equally, and are divided, ſhare and ſhare alike, among all the male children; and, in defect of theſe, among the females. They are of age, or qualified to take the lands upon them, at fifteen; and may then give, vend, or alienate the ſame to any perſon, without the conſent of any lord: and children here inherit their father's land, though convicted of felony, murder, &c. according to the maxim, "The father to the bough, the ſon to the plough." It has been held, however, that in matters of treaſon, which ſtrike at the foundations of policy and government, even gavel-kind lands are forfeitable, and *always were*. The tenants in gavel-kind are to do fealty, and to be in the tuition of the next a-kin, who is not next heir after them, till fifteen years of age; to pay acknowledgment to the lord for the lands, &c.

Gavel-kind is ſaid to be only a ſpecies of a ſocage tenure, modified by the cuſtom of the country; the lands being holden by ſuit of court and fealty, which is a ſervice in its nature certain. (Wright, 211.) And therefore by a charter of king John, Hubert, archbiſhop of Canterbury, was authorized to exchange the gavel-kind tenures holden of the ſee of Canterbury, into tenures by knight's ſervice; and by the above-mentioned ſtatute of 31 Hen. VIII. c. 3. for diſgavelling lands in Kent, they are directed to be deſcendible, for the future, like other lands, which were never holden by ſervice of ſocage. The immunities which the tenants in gavel-kind enjoyed, are ſuppoſed to be ſuch as cannot be conceived to have been conferred on mere ploughmen and peaſants; from all which the learned commentator apprehends it to be ſufficiently clear, that tenures in free ſocage are in general of a nobler original than is aſſigned by Littleton, or after him by the bulk of common lawyers. Bl. Com. v. ii.

The cuſtom of gavel-kind is not altered, though a fine be levied of the lands at common law; becauſe it is a cuſtom that runs with the land. (6 E. VI.) A wife ſhall be endowed of gavel-kind land, of a moiety of the land of which her huſband died ſeiſed, during her widowhood. (Co. Litt. 3.) And it has been adjudged, that a widow cannot have election to demand her thirds or dower at common law, ſo as to avoid the cuſtom, by which ſhe ſhall loſe her dower, if ſhe marry a ſecond huſband. (Moor. 26c. 1 Leon. 62.) See DOWER. The huſband ſhall be tenant by the curteſy of half the gavel-kind lands of the wife, during the time he continues unmarried, without having any iſſue by his wife; but if he marry, he ſhall forfeit his tenancy by the curteſy. (Co. Lit. 3.) If the huſband had iſſue by his wife, he ſhall be tenant by the curteſy of the whole land; and though he marry he ſhall not forfeit his tenancy. (Mich. 21 Car. B.R. 1 Lil. Abr. 649.)

A rent in fee granted out of gavel-kind lands ſhall deſcend in gavel-kind to all the heirs male, as the lands would have done; it being of the ſame nature with the land itſelf. (2 Lev. 138. 1 Mod. 97.) If lands are alleged to be in Kent, it ſhall be intended that they are gavel-kind; if the contrary doth not appear. (2 Sid. 153.) By Hale, Ch. J. gavel-kind law is the law of Kent, and is never pleaded, but preſumed; and it has been held that the ſuperior courts may take notice of gavel-kind generally without pleading; though not of the ſpecial cuſtom of deviſing it, which ought to be pleaded ſpecially. (1 Mod. 98. Cro. Car. 465. Lutw. 236. 756.)

The gavel-kind deſcent of lands in Ireland was an incident to the cuſtom of *taniſtry*; and as ſuch fell to the ground with its principal, in conſequence of a ſolemn judgment againſt the latter in a caſe Ann. 5 Jac. I. (Dav. Rep. 28.) But in the reign of queen Ann the policy of weakening the Roman Catholic intereſt in Ireland was the cauſe of an Iriſh ſtatute to make the lands of papiſts deſcendible according to the gavel-kind cuſtom, unleſs the heir conformed within a limited time. (See Rob. on Gavelkind, c. 17.) However now, by an Iriſh ſtatute of the preſent reign (17 and 18 Geo. III. c. 49.) the deſcent of the lands of papiſts is again reduced to the courſe of the common law. (1 Inſt. 176. n. 1.)

GAVELKOVEN, in *Geography*, a town of Germany, in Lower Bavaria; 20 miles S.E. of Landſhut.

GAVELLER, in *Mining*, ſignifies a bar-maſter or bailiff of a mineral liberty or diſtrict, an officer who collects the cope, tolls, or dues of the king, or lord of the ſoil, from the ſeveral mine-adventurers; to whom alſo he gives poſſeſſion of their mines, according to the eſtabliſhed laws and cuſtoms of the field or diſtrict. See MINING.

GAVELLING, is the act of freeing a mine, or obtaining the right to work it, by paying the accuſtomed fees to the gaveller or bar-maſter, whether in ore obtained from the mine to be freed, as is the cuſtom of the king's field in Derbyſhire, or in money, as is done in ſome diſtricts.

GAVELLO, in *Geography*, a town of Italy, in the Polesino de Rovigo ; 8 miles S.W. of Adria.

GAVELMAN, a tenant who is liable to tribute.

"Villani de Terring, qui vocantur gavelmanni." Somner, *Gavelkind*. Hence gavel-kind has been thought to be land in its nature taxable. Blount.

GAVELMED, the duty or work of mowing grass, or cutting of meadow land, required by the lord from his customary tenants. "Consuetudo falcandi quæ vocatur gavelmed." Somner.

GAVELOCK, in *Rural Economy*, an iron bar or crow used in entering stakes, posts, &c. into the earth. It should have sufficient substance in order to prevent its being bent in employing it ; and have a claw at one end for the purpose of wrenching out nails, &c.

GAVELRIP, bedreap, or duty of reaping, at the command of the lord—"de consuetudine metendi 40 acras et dimid. de gavelrip in autumno 40 sol. et sex denar."

GAVELWERK, was either *manu-opera*, by the hands and person of the tenant, or *carr-opera*, by his carts or carriages.

GAVENNY, in *Geography*, a river of Wales, which runs into the Usk, near Abergavenny.

GAUER, a river of Scotland, which forms a communication between loch Lydoch and loch Rannock.

GAVEREN, a town of France, in the department of the Scheldt, on the Scheldt ; 7 miles E. of Ghent.

GAUERS, a town of Silesia, in the principality of Neisse ; 5 miles W.N.W. of Potschau

GAVETA, La, a town of Naples, in Capitanata ; 16 miles S.W. of Manfredonia.

GAVETTO, a sea-port town of Algiers, on the east side of the gulf of Stora.

GAUGAMELA, in *Ancient Geography*, a small place of Asia, on a plain between the rivers Zabus and Bumadus, to the north of the place where the latter discharges itself into the former. This place is famous for the battle, called the battle of *Arbela* ; which see.

GAUGE, in *Engineery*, sometimes signifies the same with weir : a gauged bar is an upper gate, or over-fall to a weir. See Smeaton's Reports, vol. i. p. 62.

Gauge-*line*, a line on the common gauging-rod, whose description and use see under the article Gauging.

Gauge-*point* of a solid measure is the diameter of a circle, whose area is equal to the solid content of the same measure.

Thus the solidity of a wine gallon being 231 cubic inches : if you conceive a circle to contain so many inches, the diameter of it will be 17.15 : and that will be the gauge-point of wine measure.

And an ale-gallon containing 282 cubic inches ; by the same rule, the gauge-point for ale-measure will be found to be 19.15 : and after the same manner may the gauge-point of any other measure be determined.

Hence we deduce, that when the diameter of a cylinder in inches is equal to the gauge-point in any measure (given likewise in inches) every inch in length thereof will contain an integer of the same measure. In a cylinder, whose diameter is 17.15 inches, every inch in height contains one entire gallon in wine-measure ; and in another, whose diameter is 19.15, every inch in length contains only one ale-gallon.

Gauge-*weir*, in *Engineery*, is a weir or over-fall, out of some reservoir, or pound of a canal, calculated to discharge a given quantity of water daily, for the supply of mills, or some other canal. See Canal.

GAUGER, an officer appointed by the king to gauge, *i. e.* to examine or measure, all casks, tuns, pipes, barrels, hogsheads of beer, wine, oil, &c. and to give them a mark of allowance (which is a circle burnt with an iron) before they be sold in any place within the extent of this office.

Of this officer and his office we have many statutes ; thus, by 27 Edw. III. c. 8. all wines, &c. imported, are to be gauged by the king's gaugers or their deputies ; by 31 Edw. III. c. 5. selling wine before gauged, incurs forfeiture, or the value : and by 23 H. VI. c. 15. the gauge penny is to be paid gaugers on gauging wines. The 31 Eliz. ordains that beer, &c. imported shall be gauged by the master and wardens of the Coopers' company : see 12 Car. II. c. 4. The wardens of the Coopers shall attend to gauge vessels upon request. 23 Hen. VIII. c. 4. Gaugers may take samples not exceeding half a pint, 32 Geo. II. c. 29. See Excise.

GAUGING, the art or act of measuring the capacities or contents of all kinds of vessels, and determining the quantity of fluids or other matters contained therein.

Gauging is the art of reducing the unknown capacity of vessels of divers forms, cubical, parallelepepidal, cylindrical, spheroidal, conical, &c. to some known cubic measure ; and of computing, for instance, how many gallons, quarts, pints, or the like, of any liquor, *e. gr.* ale, beer, wine, brandy, &c. are contained therein.

Gauging is a branch of stereometry.

The principal vessels that come under its operation are pipes, barrels, rundlets, and other casks ; also backs, coolers, vats, &c.

The solid content of cubical, parallelepepidal, and prismatical vessels, is easily found in cubic inches, or the like, by multiplying the area of the base by the perpendicular altitude.

And for cylindrical vessels, the same is found by multiplying the area of the circular base by the perpendicular altitude, as before.

Casks of the usual form of hogsheads, kilderkins, &c. may be considered as segments of a spheroid cut off by two planes perpendicular to the axis : which brings them to Oughtred's theorem for measuring ale and wine casks, which is thus : add twice the area of the circle at the bung to the area of the circle of the head ; multiply the sum by one-third of the length of the cask, the product is the content of the vessel, in cubic inches. But for accuracy, Dr. Wallis, Mr. Caswell, &c. think, that most of our casks had better be considered as frustums of parabolic spindles, which are less than the frustums of spheroids of the same base and height, and give the capacity of vessels nearer the truth than either Oughtred's method, which supposes them spheroids ; or than that of multiplying the circles of the bung and head into half the length of the cask, which supposes them parabolic conoids : or than that of Clavius, &c. who takes them for two truncated cones : which is farthest off of all.

The common rule for all wine or ale casks is to take the diameters at the bung, and at the head, by which you may find the area of the circle there ; then taking two-thirds of the area of the circle at the bung, and one-third of the area of the circle at the head, and adding them together into one sum, this sum, multiplied by the internal length of the cask, gives the content in solid inches ; which are converted into gallons, by dividing by 282 for ale, and by 231 for wine gallons.

The readiest method for common use is to reduce the cask

to a cylinder of equal contents; and this is done by conſidering what is called the variety of the caſk. Suppoſe a cylinder inſcribed in a caſk, and another circumſcribed about it, there will be a cylindrical ſpace included between the ſuperficies of the two cylinders, whoſe diameter or thickneſs is equal to the difference between the bung and head diameters of the caſk; the curvature of the ſtaves of the caſk takes in a certain proportion of the cylindrical ſpace, which is greater or leſs, as the curvatures bend, or bulging of the ſtaves is greater or leſs; and this determines what is called the variety; and it will be the firſt variety, if the caſk bulges very much; ſecond variety, if leſs, and ſo on: it is, therefore, evident, that the diameter of the inſcribed circle may be increaſed ſo as to take in a portion of the interjacent cylindrical ſpace equal to that taken in by the curvature of the ſtaves of the caſk; and then the caſk and increaſed cylinder will be equal in content. The diameter of the inſcribed cylinder is the head diameter of the caſk; the thickneſs of the cylindrical ſpace is equal to the difference between the bung and head diameters. The only difficulty, therefore, lies in determining what portion of this difference muſt be added to the head diameter of the caſk, in order to obtain the diameter of the mean cylinder, or the cylinder of equal content. Now experience ſhews, that if 7-10ths of the difference between the head and bung diameters of any caſk be added to the head diameter, the cylinder whoſe diameter is equal to this ſum, and whoſe length is equal to that of the caſk, will contain as much or more than that caſk, though the ſtaves have the greateſt degree of curvature that is ever given to them. And as the difference between the bung and head-diameters of caſks is ſeldom very great, the contents of a caſk whoſe ſtaves are quite ſtraight from bung to head, or of a caſk made up of two equal fruſtums of two equal cones, will generally be nearly equal to the contents of a cylinder, whoſe diameter is equal to the ſum of the head diameter of the caſk, and a little more than half the difference between the bung and head diameters, and whoſe length is equal to the length of the caſk. Therefore, all the varieties of which caſks are capable, lie between 5-10ths and 7-10ths of the difference between the bung and head diameters; and the gauger has only to take ſuch a part of this difference (always between 5-10ths and 7-10ths) as his judgment and experience inform him to be moſt ſuitable to the curvature of the caſk; and this, added to the head diameter, gives the diameter of the mean cylinder.

It may not be amiſs to note here, that the difference between the bung and head diameters may be very great, and yet the caſk have no bulging at all, for the bulging is the bend or curvature of the half-ſtave, between the bung and the head.

Mathematicians give us abſtruſe theorems, for computing the contents of caſks, upon the ſuppoſed reſemblance between the curvature of the caſk and that of an ellipſis, parabola, or hyperbola; but they may be as much miſtaken in judging of the curvature, as an experienced gauger between 5-10ths and 7-10ths: for after all, the contents of caſks cannot be determined to a mathematical exactneſs; becauſe the forms of caſks do not exactly anſwer any mathematical figures. The buſineſs of gauging is at beſt but gueſs-work; but it is ſuch a way of gueſſing, as comes near enough the truth for the common purpoſes of life.

Hence we may add ſuch decimal multipliers, for the difference between bung and head diameters as have been found by experience to be the trueſt, and beſt ſuited to the ſeveral varieties or curvatures of caſks.

Firſt variety, or ſtaves very much bulging,	.7 or .695
Second variety, or ſtaves not ſo much curved,	.65 or .63
Third variety, or ſtaves ſtill leſs curved,	.6 or .56
Fourth variety, or ſtaves almoſt ſtraight,	.55 or .51

The following rule will ſerve for gauging caſks by the pen: take the difference of the bung and head diameters of any caſk, and multiply that difference by the number which ſtands againſt the name of the caſk given in the table, add the product to the head diameter; and the ſum will be the diameter of a cylinder, which, being of the ſame length with the given caſk, will contain as much; ſquare the diameter thus found, and multiply that ſquare by the length, and divide the product by 359 for beer gallons, and 294 for wine.

The multipliers for a caſk, which is taken for varieties:

The middle fruſtum	1. Of a ſpheroid	.7	greateſt bulge.
	2. Of a parab. ſpindle	.63	next leſs.
	3. Two conoids	.56	next leſs to that.
	4. Two cones	.51	next leſs to that.

Example.—Let a caſk be taken as the middle fruſtum of a ſpheroid, the bung diameter of which is 32 inches, the head 26, and length 50 inches; what is the content in beer and wine gallons? $\overline{32 - 26} \times .7 = 4.2$. To which add 26, and we ſhall have 30,2 for the mean diameter; and $\overline{30.2}|^2 = 912.04$, which multiplied by the length 50 will give 45602; and $\frac{45602}{359} = 127$ beer gallons; and $\frac{45602}{294} = 155.1$ wine gallons. The contents of other caſks may be found in the ſame manner by uſing the proper multipliers. See Everard's SLIDING *rule*.

For the ready computation of the contents of veſſels, or of any ſolids in the meaſures in uſe in Great Britain, we ſhall here inſert the following rules taken from a Treatiſe of Practical Geometry, publiſhed at Edinburgh in 1745, 8vo. Vide pag. 137. ſeq.

1°. To find the content of a cylindric veſſel in Engliſh wine gallons, the diameter of the baſe and altitude of the veſſel being given in inches and decimals of an inch: ſquare the number of inches in the diameter of the veſſel; multiply this ſquare by the number of inches in the height, then multiply this product by the decimal fraction 0.0034, and you will have the contents of the veſſel in gallons, and decimals of a gallon. For example, let the diameter be = D = 51.2 inches, the height = H = 62.3 inches, then will the content be D D H × 0.0034 = 51.2 × 51.2 × 62.3 × 0.0034 = 555.27342 wine gallons.

2°. Suppoſing the Engliſh ale gallon to contain 282 cubical inches, the content of a cylindric veſſel is computed in ſuch gallons, by multiplying the ſquare of the diameter of the veſſel by its height as before, and their product by the decimal fraction 0.0027851, that is, the ſolid content in gallons will be D D H × 0.0027851.

3°. If the Scotch pint contains 103.4 cubical inches, the content of ſuch a veſſel in Scotch pints, will be D D H × 0.0076.

4°. Suppoſing the Wincheſter buſhel to contain 2178 cubic inches, the content of a cylindric veſſel is computed in thoſe buſhels, by multiplying the ſquare of the diameter of the veſſel by the height, and the product by the decimal fraction 0.0003606. But the legal Wincheſter buſhel containing only 2150.42 ſolid inches, the content of a cylindric veſſel is computed in ſuch buſhels, by multiplying the ſquare of the diameter by the height, and their product by the decimal 0.0003652. Or the content will be D D H × 0.0003652 See BUSHEL.

5°. Suppoſing the Scotch wheat firlot to contain $21\frac{1}{4}$ Scotch pints, or about 2197 cubical inches, the contents of a cylindric veſſel in ſuch firlots will be D D H × 0.000358.

And if the beer firlot contain 31 Scotch pints, the contents of ſuch a veſſel in beer firlots will be D D H × 0.000245. See FIRLOT.

6°. It is to be obſerved, that when the ſection of the veſſel is not a circle, but an ellipſis, the product of the greateſt diameter by the leaſt is to be ſubſtituted in theſe rules, for the ſquare of the diameter.

7°. To compute the content of a veſſel, which may be conſidered as the fruſtum of a cone in any of thoſe meaſures. Let A repreſent the number of inches in the diameter of the greater baſe, B the number of inches in the diameter of the leſſer baſe. Compute the ſquare of A, the product of A by B, and the ſquare of B. Take the third part of the ſum of all theſe, and ſubſtitute it in the preceding rules for the ſquare of the diameter, and proceed in all reſpects as before. Thus for example, the content in wine gallons will be $\overline{A\,A + A\,B + B\,B} \times \frac{1}{3}\,H \times 0.0034$. Or thus: To the ſquare of half the ſum of A and B add one-third of the ſquare of half their difference; and ſubſtitute this ſum in the preceding rules for the ſquare of the diameter of the baſe of the veſſel. For the ſquare of $\frac{1}{2}\,A + \frac{1}{2}\,B$ added to $\frac{1}{3}$ of the ſquare of $\frac{1}{2}\,A - \frac{1}{2}\,B$ gives $\frac{1}{4}\,A\,A + \frac{1}{2}\,A\,B + \frac{1}{4}\,B\,B + \frac{1}{12}\,A\,A - \frac{1}{6}\,A\,B + \frac{1}{12}\,B\,B = \frac{1}{3}\,A\,A + \frac{1}{3}\,A\,B + \frac{1}{3}\,B\,B$.

8°. When the veſſel is a fruſtum of a parabolic conoid, meaſure the diameter of the ſection at the middle of the height of the fruſtum: and the content will be the ſame as of a cylinder of this diameter, of the ſame height with the veſſel.

9°. When a veſſel is a fruſtum of a ſphere, if you meaſure the diameter of the ſection at the middle of the height of the fruſtum, then compute the content of a cylinder of this diameter, and of the ſame height with the veſſel, and from this ſubtract $\frac{1}{3}$d of the content of a cylinder of the ſame height, on a baſe, the diameter of which is equal to that height; the remainder will give the content of the veſſel. That is, if D repreſent the diameter of the middle ſection, and H the height of the fruſtum, you are to ſubſtitute $D\,D - \frac{1}{3}\,H\,H$ for the ſquare of the diameter of the cylindric veſſel in the firſt ſix rules.

10°. When the veſſel is a fruſtum of a ſpheroid, if the baſes are equal, the content is readily found by the rule given from Oughtred. In other caſes, let the axis of the ſolid be to the conjugate axis, as n to 1; let D be the diameter of the middle ſection of the fruſtum, H the height or length of the fruſtum, and ſubſtitute in the firſt ſix rules $D\,D - \frac{H\,H}{3\,n\,n}$ for the ſquare of the diameter of the veſſel.

11°. When the veſſel is a hyperbolic conoid, let the axis of the ſolid be to the conjugate axis as n to 1, D the diameter of the ſection at the middle of the fruſtum H, the height or length, compute $D\,D + \frac{H\,H}{3\,n\,n}$, and ſubſtitute this ſum for the ſquare of the diameter of the cylindric veſſel in the firſt ſix rules.

12°. In general, it is uſual to meaſure any round veſſel, diſtinguiſhing it into ſeveral fruſtums, and taking the diameter of the ſection at the middle of each fruſtum; thence to compute the content of each, as if it was a cylinder of the mean diameter; and to give their ſum as the content of the veſſel. From the total content computed in this manner they ſubtract ſucceſſively the numbers which expreſs the circular areas that correſpond to thoſe mean diameters, each as often as there are inches in the altitude of the fruſtum to which it belongs, beginning with the uppermoſt; and in this manner calculate a table for the veſſel, by which it readily appears how much liquor is at any time contained in it, by taking either the dry, or the wet inches; having regard to the inclination, or drip of the veſſel, if it has any.

This method of computing the content of a fruſtum from the diameter of the ſection at the middle of its height, is exact in that caſe only when it is a portion of a parabolic conoid; but in ſuch veſſels as are in common uſe the error is not conſiderable. When the veſſel is a portion of a cone or hyperbolic conoid, the content by this method is found leſs than the truth; but when it is a portion of a ſphere or a ſpheroid, the content computed in this manner exceeds the truth. The difference or error is always the ſame in different parts of the ſame, or ſimilar veſſels, when the altitude of the fruſtum is given. And when the altitudes are different, the error is in the triplicate ratio of the altitude. If exactneſs be required, the error in meaſuring the fruſtum of a conical veſſel, in this manner, is $\frac{1}{4}$th of the content of a cone, ſimilar to the veſſel, of an altitude equal to the height of the fruſtum. In a ſphere it is $\frac{1}{3}$d of a cylinder, of a diameter and height equal to the fruſtum. In the ſpheroid and hyperbolic conoid, it is the ſame as in a cone, generated by the right-angled triangle contained by the two ſemiaxes of the figure revolving about that ſide which is the ſemiaxis of the fruſtum. Theſe are demonſtrated in a treatiſe of fluxions by Mr. Maclaurin, where thoſe theorems are extended to fruſtums that are bounded by planes oblique to the axis in all the ſolids, that are generated by any conic ſection revolving about either axis. Vide p. 25. and 715.

In the uſual method of computing a table for a veſſel, by ſubducting from the whole content the number that expreſſes the uppermoſt area, as often as there are inches in the uppermoſt fruſtum, and afterwards the numbers for the other areas ſucceſſively, it is obvious that the contents aſſigned by the table, when a few of the uppermoſt inches are dry, are ſtated a little too high, if the veſſel ſtands on its leſſer baſe, but too low when it ſtands on its greater baſe; becauſe, when one inch is dry, for example, it is not the area at the middle of the uppermoſt fruſtum, but rather the area at the middle of the uppermoſt inch, that ought to be ſubducted from the total content, in order to find the content in this caſe.

But gauging, as now practiſed, is chiefly done by means of inſtruments called *gauging-rods*, or *rules*, which do the buſineſs at once, and anſwer the queſtion without ſo much calculation; which is no inconſiderable addition, both to the eaſe and diſpatch of the work. This inſtrumental way of gauging, therefore, we ſhall here chiefly inſiſt upon.

Dr. Hutton in his "Menſuration" has given rules for computing the contents of the various fruſtums of ſolids, which bear reſemblance to the ſeveral varieties or forms of different caſks. Rules adapted to theſe forms will be found under the denominations of the ſeveral ſolids to which they belong in this Cyclopædia; and they occur in moſt books, profeſſedly written on the ſubject of Gauging. We ſhall here ſubjoin one general rule, extracted from the above-cited treatiſe, (p. 592) which may be eaſily applied to the caſes that occur.

General Rule.

Add into one ſum 39 times the ſquare of the bung diameter,
25 times the ſquare of the head diameter,
and
26 times the product of thoſe diameters.

Multiply the ſum by the length of the caſk, and the product by the number .00034; then this laſt product divided by 9

will

will give the wine gallons, and divided by 11 will give the ale gallons: or, $\overline{39\,B^2+25\,H^2+26\,BH} \times \frac{L}{114}$ is the content in inches; which being divided by 231 for wine gallons, or by 282 for ale gallons, will be the content.

E. G. If the length of a cask be 40 inches, the bung diameter 32, and the head diameter 24.

Here $32^2 \times 39 = 39936$
$24^2 \times 25 = 14400$
$32 \times 24 \times 26 = 19968$

The sum - - 74304
multiplied by - 40

divided by 114) 2972160
gives - - 26071 cubic inches: and
this divided by 231 gives 112 wine gallons,
or divided by 282 gives 92 ale gallons.

Construction of a Gauging-rod, whereby the content of any cylindrical, or common vessel, is easily had.—Take the diameter A B of a cylindrical vessel, A B D E, *Plate* IV. *Surveying, fig.* 2, that holds one of the measures wherein the fluid is estimated, *e. gr.* gallons, and join it at right angles to the indefinite line A 7. From A to 1, set off a right line equal to A B; then will B 1 be the diameter of a vessel, that holds two measures, or gallons, of the same height as the former.

Again, let A 2 = B 1; then will B 2 be the diameter of a vessel that holds three measures, but of the same height as that which only holds one. And, after the same manner, find the diameter of other large vessels, B 3, B 4, B 5, B 6, B 7, &c.

Lastly, set off the several divisions thus found, A 1, A 2, A 3, &c. upon the side of a rod or rule; and, on the other, the height or depth of a cylinder, that holds one measure or gallon, repeated as oft as it will go. Thus is the gauging-rod complete.

For cylinders, that have the same altitude, are to each other as the squares of their diameters; consequently the square of the diameter of the vessel that holds 2, 3, or 4 gallons, must be double, triple, or quadruple of that which only holds one. And since in the first, A B = A 1, the square of B 1 is double, that of B 2 triple, that of B 3 is quadruple, &c. it is evident, that the right lines A 2, A 3, A 4, &c. are the diameters of the vessels required.

These divisions, therefore, being applied to the side of a cylindrical vessel, it will immediately appear how many measures, *e. gr.* gallons, a cylindrical vessel of that base, and of the height of that which holds one gallon, will contain.

Wherefore, finding by the divisions on the other side of the rod, how often the height of one gallon is contained in the height of the given vessel; and multiplying the diameter before found by this number; the product will be the number of gallons the vessel contains.

Thus, *e. gr.* if the diameter of the cylindrical vessel be 8, and its height 12, its contents will be 96 gallons.

Note, 1°. The less you take the height of the cylinder containing one gallon, the greater will the diameter of the base be: whence both that, and the diameters of the cylinders containing several gallons, will be the more easily divisible into lesser parts. Bayer directs such height to be only one digit, or tenth of an inch.

2°. The diameters of vessels holding one or more decimal parts of a gallon will be had, by dividing one or more decimal parts of the vessel holding a whole gallon, by its height: which gives us the area of the circular base; from whence the diameter is easily found by the rules delivered under DIAMETER, CIRCLE, &c. And after the same manner, the diameters are found for the divisions of vessels, that hold two or more gallons.

GAUGING-*rod, use of the.*—To find the content of a cask; that is, to determine the number of measures, *e. gr.* gallons, it will hold: apply the gauging-rod to the vessel, as directed in the preceding article, and find both the length of the cask, A C, *fig.* 3, and both diameters, G H and A B. Now, as we find, by experiment, how far soever it may be from geometrical exactness, that a common cask of this form may safely enough be reputed as a cylinder, whose base is a medium between the head and the belly; find such medium, which call the *equated diameter.*

Then multiplying the number thus found by the length of the cask A C, the product will be the number of measures the vessel contains.

Suppose, *e. gr.* A B = 8, and G H = 12, and A C = 15, the equated diameter will be 10, which multiplied by 15, gives the capacity of a cask, 150 measures.

If it happen, that the diameters of the two ends be not equal, measure them both, and take half their sum for the diameter to work by.

There is another method whereby the content of a vessel is had, without any calculation at all, which obtains in divers parts of Germany and the Low-Countries: but as this supposes all vessels to be similar to each other, and their length double of the equated diameter, that is, of half the sum of the diameters A B and G H, it is not safe to use it in all places. Kepler, however, prefers it so much before all others, as including all the precautions possible, that he recommends it to the public, to enact it by law, that all casks be made in this proportion.

The methods of gauging, which chiefly obtain among us, are, by the four-foot gauging-rod, and Everard's sliding-rule.

GAUGING-*rod, description and use of the four-foot.*—The four-foot gauging-rod, represented in *fig.* 4, is usually made of box, and consists of four rules each a foot long, and about three-eighths of an inch square, joined together by three brass joints; by which means the rod is rendered four feet long, when the four rules are quite opened, and but one foot when they are all folded together.

On the first face of this rod, marked 4, are placed two diagonal lines; one for beer, and the other for wine: by means of which the content of any common vessel in beer or wine gallons may be readily found, by putting the rod in at the bung-hole of the vessel, till it meets the intersection of the head of the vessel with the staves opposite to the bung-hole. For distinction of this line, there is written on it, *beer* and *wine gallons.*

On the second face, 5, are a line of inches, and the gauge-line; which is a line expressing the areas of circles, whose diameters are the correspondent inches in ale gallons. At the beginning is written, *ale area.*

On the third face, 6, are three scales of lines; the first, at the end of which is written *hogshead,* is for finding how many gallons there are in a hogshead, when it is not full, lying with its axis parallel to the horizon. The second line, at the end of which is written *B. L.* signifying a *butt lying,* is for the same use as that for the hogshead. The third line is to find how much liquor is wanting to fill up a butt when it is standing: at the end of it is written *B. S.* signifying a *butt standing.* In the half of the fourth face of the gauging-rod, 7, there are three scales of lines, to find the wants in a firkin, kilderkin, and barrel, lying with their

their areas parallel to the horizon. They are diſtinguiſhed by letters *F. K. B.* ſignifying a *firkin, kilderkin,* and *barrel.*

GAUGING-*rod, uſe of the diagonal lines on the.*—To find the content of a veſſel in beer or wine gallons, put the braſed end of the gauging-rod into the bung-hole of the caſk, with the diagonal lines upwards, and thruſt its braſed end to the meeting of the head and ſtaves; then with chalk, make a mark at the middle of the bung-hole of the veſſel, and alſo on the diagonal lines of the rod, right againſt, over one another, when the braſed end is thruſt home to the head and ſtaves: then turn the gauging-rod to the other end of the veſſel, and thruſt the braſed end home to the end, as before.

Laſtly, ſee if the mark made on the gauging-rod come even with the mark made on the bung-hole, when the rod was thruſt to the other end; which if it be, the mark made on the diagonal lines will, on the ſame lines, ſhew the whole content of the caſk in beer or wine gallons.

If the mark made on the bung-hole be not right againſt that made on the rod, when you put it the other way, then, right againſt the mark made on the bung-hole, make another on the diagonal lines; and the diviſion on the diagonal line, between the two chalks, will ſhew the veſſel's whole content in beer or wine gallons.

Thus, *e. gr.* if the diagonal line of a veſſel be 28 inches four-tenths, its contents in beer gallons will be near 51, and in wine gallons 62.

If a veſſel be open, as a half-barrel, tun, or copper, and the meaſure from the middle on one ſide to the head and ſtaves be 38 inches, the diagonal line gives 122 beer gallons; half of which, *viz.* 61, is the content of the open half tub.

If you have a large veſſel, as a tun or copper, and the diagonal line, taken by a long rule, proves 70 inches; the content of that veſſel may be found thus:

Every inch at the beginning-end of the diagonal line, call ten inches. Thus ten inches become 100 inches; and every tenth of a gallon call 100 gallons; and every whole gallon call 1000 gallons.

Exam.—At 44.8 inches, on the diagonal beer-line, is 200 gallons; ſo that four inches 48 parts, now called 44 inches 8 tenths, is juſt two-tenths of a gallon, now called 200 gallons: ſo alſo, if the diagonal line be 76 inches and 7 tenths, a cloſe caſk, of ſuch diagonal, will hold a 1000 beer gallons; but an open caſk but half ſo much, *viz.* 500 beer gallons.

GAUGE-*line, uſe of the.*—To find the content of any cylindrical veſſel in ale gallons: ſeek the diameter of the veſſel in inches, and, juſt againſt it, on the gauge-line, is the quantity of ale gallons contained in one inch deep: this, multiplied by the length of the cylinder, will give its content in ale gallons.

For example, ſuppoſe the length of the veſſel 32.06, and the diameter of its baſe 25 inches; to find what is the content in ale gallons?

Right againſt 25 inches, on the gauge-line, is one gallon, and 745 of a gallon; which multiplied by 32.06, the length, gives 55.9447 gallons for the content of the veſſel.

The bung diameter of a hogſhead being 25 inches, the head diameter 22 inches, and the length 32.06 inches, to find the quantity of ale gallons contained in it?

Seek 25, the bung diameter, on the line of inches; and right againſt it, on the gauge-line, you will find 1.745: take one-third of it, which is .580, and ſet it down twice: ſeek 22 inches in the head diameter, and againſt it you will find, on the gauge-line, 1.356; one-third of which, added to twice .580, gives 1.6096; which multiplied by the length 32.06, the product will be 51.603776, the content in ale gallons.

Note, this operation ſuppoſes, that the aforeſaid hogſhead is in the figure of the middle fruſtum of a ſpheroid.

The uſe of the lines on the two other faces of the rod is very eaſy; you need only put it downright into the bung-hole (if the veſſel you deſire to know the quantity of ale gallons contained therein be lying) to the oppoſite ſtaves; and then where the ſurface of the liquor cuts any one of the lines appropriated to that veſſel, will be the number of gallons contained in that veſſel.

The deſcription and uſe of Everard's ſliding-rule for gauging, ſee under SLIDING-*rule.*

GAUGING MASTER, on *Canals,* is an officer appointed to meaſure, weigh, and aſcertain exactly the tonnage of the boats uſed on canals; the proceſs of which, as practiſed on the Grand Junction canal, we have deſcribed under the article CANAL. It may be proper here, however, to remark, that the practice, now followed on many of the Britiſh canals, was firſt ſuggeſted by Thomas Walker, eſq. of Bilborough, Notts, in 1798, who contrived a weighing-houſe, and with the concurrence of the Cromford canal company, and thoſe of the Derby, Erewaſh, Grantham, Leiceſter, Milton-Mowbray, Nottingham, Nutbrook, and Trent canals and navigations, drew up a ſet of general regulations for the boats uſed on all theſe navigations, and ſuperintended the gauging of the firſt ſet of boats, and the eſtabliſhment of gauging-maſters, at the ſouth end of the Erewaſh canal, and other places, for gauging the boats, affixing proper numbers and graduated plates on each, for aſcertaining thereby the exact loading carried by each boat, every time which it paſſed a weighing-houſe; and in order to aboliſh a practice which had previouſly prevailed, of giving large and unequal weights to the purchaſers of coals, at the different wharfs belonging to the coal-maſters, on the Cromford, Erewaſh, Nottingham, and Nutbrook canals. The coal-maſters of that diſtrict, with ſome very few exceptions, came to the reſolution of all ſelling their coals by the gauging-maſter's accounts, and by which alſo the canal-companies agreed to take their tonnage: and thus one uniform weight is eſtabliſhed in the trade on theſe ſeveral canals. The full particulars of the dimenſions and condition of the ſeveral boats uſing theſe navigations, ſhewing the loading which they have on board at every inch of their draught of water, is printed from time to time, in an uniform manner, ſo as to bind up in octavo volumes for the uſe of the ſeveral gauging-maſters, boat-owners, colliers and traders, &c. Of theſe we have ſeen four volumes, printed by Tupman & Co. of Nottingham, containing the particulars of 430 wide and 60 narrow boats. Mr. Walker was, in January 1805, preſented with a large and ſuperb ſilver cup, at the joint expence of the above canal companies, for his important ſervices in contriving and bringing theſe regulations to perfection. We have been the more particular in mentioning theſe regulations, in order to call the attention of the owners and traders on other canals to the adoption of ſimilar plans, by which trade in general would be much facilitated, and the fair trader protected from the deceptive arts of thoſe who are ſtriving to obtain buſineſs, by pretending to give large and unuſual weights of their commodities to purchaſers, inſtead of lowering the prices, which they would do if their pretenſions to cheapneſs were well founded.

GAVI, in *Geography,* a town of Genoa, once ſo ſtrong as to command the paſs of the Bochetta, but now diſmantled; 20 miles N. of Genoa. N. lat. 44° 43′. E. long. 8° 48.

GAVIA,

GAVIA, a town of Spain, in the province of Grenada; four miles S.S.W. of Grenada.

GAVIA, in *Ornithology*. See LARUS and STERNA.

GAVIAON, the name by which the Portugueſe called the *caracara*, a ſpecies of Braſilian hawk, of the bigneſs of our kite.

GAVILAN, in *Natural Hiſtory*, a name given by the Spaniards to a ſpecies of hawk, common in the Philippine iſlands; it is ſomewhat larger than our ſparrow-hawk, and is of a yelloviſh colour on the back and wing, and whitiſh under the belly: it is the moſt common of all the birds of prey in that part of the world, and is very voracious and miſchievous.

GAVINO, in *Geography*, a town of Portugal, in Alentejo; 20 miles N.W. of O-Crato.

GAVINO, *St.* a town of the iſland of Sardinia; 24 miles S.E. of Oriſtagni.

GAVIOTA, in *Ornithology*, the name given by the Portugueſe to a water-fowl of the gull kind, common in Braſil, and called by the natives *guacu guacu*. See LARUS *Hibernus*.

GAUL, or GALLIA, in *Ancient Geography*, a country of Europe, bounded on the north and weſt by the ſea, on the eaſt by the Rhine and Alps, and on the ſouth by the Mediterranean and the Pyrenées, and extending from 42° 30′ to 52° N. lat., and from 4° 40′ to 8° 20′ E. long. The greateſt breadth was 600 Engliſh miles, but much diminiſhed towards each extremity; and its length was from 480 to 620 miles. It was therefore much more extenſive than modern France, before the late revolution; for to the dominions of that powerful monarchy, with its more recent acquiſitions of Alſace and Lorraine, we muſt add the duchy of Savoy, the cantons of Switzerland, the four electorates of the Rhine, and the territories of Liege, Luxemburg, Hainault, Flanders, and Brabant. This extenſive region was called by the Greeks "Galatia," and "Celto-galatia," to diſtinguiſh it from Galatia, a province of Aſia; and by the Romans "Gallia Ulterior, or Tranſalpina," *i. e.* Gaul beyond the Alps, in order to diſtinguiſh it from "Gallia Citerior, or Ciſalpina," which lay on the ſame ſide of the Alps with Rome, and properly formed a part of Italy.

Ciſalpine Gaul, which comprehended Piedmont and Lombardy, was denominated "Togata," from the Roman gown or dreſs, which was uſed by the inhabitants; but this country was called "Italia Subalpina," or Italy at the foot of the Alps, by Plutarch and Pliny, and ſimply Italy by Polybius. The appellation of Gallia Ciſalpina, however, was antiquated in the reign of Auguſtus, when he divided Italy into eleven regions; and accordingly this name frequently occurs in authors who flouriſhed before, and ſcarcely ever in thoſe who wrote after, the reign of Auguſtus. As to the boundaries of this country, it extended from the Alps and the river Varus, parting it from Tranſalpine Gaul, to the river Aeſis, according to Livy, or by Pliny's account, to the city of Ancona, in the ancient Picenum. On the north, Ciſalpine Gaul was divided from Rhætia by the Alps, called "Alpes Rhæticæ," and from Illyricum by the river Formio; but on this ſide, the borders of Italy were, in Pliny's time, extended to the river Arſia in Iſtria. On the ſouth it reached to the Liguſtic ſea, and the Apennines parting it from Etruria; ſo that, under the common name of Ciſalpine Gaul, were comprehended the countries lying at the foot of the Alps, called by Pliny and Strabo the Subalpine countries, Gallia Ciſpadana, and Gallia Tranſpadana. "Gallia Ciſpadana" lay next to Liguria, extending from Trebia to the city of Ancona, bounded on the north by the Po and part of the Adriatic, and on the ſouth by the Apennines parting it from Etruria. It was called "Gallia" from its inhabitants, and "Ciſpadana," becauſe it lay on the ſide of the Padus or Po, next to Rome. It was poſſeſſed by the Boii, the Lingones, and the Senones. "Gallia Tranſpadana" extended from the countries of the Lepontii, Libicii, and Cunini, which were referred by Strabo and Pliny to the claſs of Subalpine nations, to the Adriatic ſea, and the river Formio, now Il Riſano, parting it from Iſtria, being bounded on the ſouth by the Po, and on the north by the Alpes Rhæticæ and Carnicæ; the former ſeparating it from Rhætia, now the Trentin, and the latter from the country of the Carni, now Carniola. This part of Ciſalpine Gaul was inhabited by the Orobii, the Inſubres, the Lævi, the Cenomani, the Euganei, and the Veneti, and contained many conſiderable cities. See ITALY.

Tranſalpine Gaul was called "Comata" from the long hair worn by its inhabitants; and the ſouth part of it, poſſeſſed by the Romans and called by them "Provincia, or Romana Provincia," whence is derived the appellation of Provence, was afterwards denominated "Narbonenſis" and "Braccata," from the bracca or breeches uſed by the inhabitants. Gaul was chiefly peopled, at different periods, by colonies from Italy, to which it was contiguous; and about 120 years before the Chriſtian era, when the Romans meditated the conqueſt of this extenſive region, it was portioned out among three great nations. The *Celtæ*, called by Cæſar Galli or Gauls, occupied more than one half, *viz.* from the Seine and the Marne to the Garonne, and from the upper part of the Rhine to the Mediterranean. This province was anciently called "Celtica." The *Belgæ* inhabited the territory on the lower part of the Rhine. The *Aquitani* were cantoned between the Garonne, the Pyrenées, and the bay of Biſcay. When Cæſar reduced Gaul into the form of a Roman province, he divided the whole country into three parts, and named them according to three principal nations, which he found inhabiting them reſpectively, *viz.* Belgia, Aquitania, and Gallia Propria. By a new diviſion, B. C. 27, Auguſtus extended the northern boundary of Aquitania to the Loire. The country between the Loire and the Seine was denominated "Gallia Celtica," and afterwards "Lugdunenſis," from a colony ſettled at Lugdunum, or Lyons. Part of Celtica, contiguous to the Rhine, and occupied by the Sequani and Helvetii, was added to Belgica, the adjacent province. Gallia Narbonenſis firſt ſubmitted to the Roman arms. A ſmall canton, called "Viennenſis," in the Alps, maintained its liberty until ſome time after the reduction of Gaul. The remainder of Narbonenſis was divided into "Prima" and "Secunda." When the Romans gained poſſeſſion of thoſe parts of the Belgic territory, which had been ſeized by the Germans not long before the age of Cæſar, they divided the country along the Rhine, from Baſil to Leyden, into "Germania Superior and Inferior." Hence, under the Antonines, Gaul is found partitioned into ſix provinces, *viz.* Narbonenſis, Aquitania, Celtica or Lugdunenſis, Belgica, Germania Superior and Germania Inferior. Under the empire of Probus, about the year 278, Gaul was divided into ſeven provinces, *viz.* the ſix former, and the Viennenſis, which had formed a part of Narbonenſis. About the year 392, Diocleſian, having divided the empire between the two Auguſti and the two Cæſars, ſeparated the Helvetii and Sequani from Belgica, and formed a new province under the appellation of "Maxima Sequanorum." Belgica was divided into "Prima and Secunda," which was alſo the caſe with reſpect to Lugdunenſis. The four provinces of the Alps, *viz.* Alpes Penninæ, Graiæ, Maritimæ, and Cottiani, were

were reduced into two, *viz.* Alpes Maritimæ and Graiæ, and placed in the department of the Gauls. The city of Bourges was withdrawn from Aquitania, and that of Langres from Belgica, and were re-united to Lugdunenſis Prima. Accordingly Gaul, under this emperor, was divided into twelve provinces, *viz.* Narbonenſis, Viennenſis, Aquitania, Lugdunenſis Prima and Secunda, Belgica Prima and Secunda, Germania Prima and Secunda, Maxima Sequanorum, Alpes Maritimæ, and Graiæ. Under the empire of Valentinian, Gaul was again divided, by the diſmemberment of Aquitania, of which were compoſed Aquitania Prima and Secunda, and Novempopulana. The other provinces remained the ſame as they were under Dioclefian. The new provinces were Aquitania Prima and Secunda, and Novempopulana. Bourges was withdrawn from Lugdunenſis Prima, and made the metropolis of Aquitania Prima. Under the empire of Gratian the two Lugdunenſes were ſeparated into four, and Narbonenſis into two; and the number of provinces was 17, *viz.* Narbonenſis Prima and Secunda, Viennenſis, Alpes Maritimæ, Alpes Graiæ et Penninæ, Aquitania Prima and Secunda, Novempopulana, Lugdunenſis Prima, Secunda, Tertia, and Quarta, Belgica Prima and Secunda, Germania Prima and Secunda, and Maxima Sequanorum.

Such was the ſtate of Gaul, when Honorius A.D. 419, permitted the Goths to take poſſeſſion of Aquitania Secunda, a maritime province, between the rivers Garonne and Loire, the limits of which were gradually extended by the gift of ſome neighbouring territories. About the ſame period the Burgundi, a fierce and warlike tribe of Vandals, eſtabliſhed themſelves in Upper Germany, and afterwards occupied two provinces, which ſtill retain the name of that colony. The rapacity, or ambition, of the Franks was ſtimulated by the ſucceſs of thoſe invaders. Colonies multiplied along the banks of the Meuſe, the Scheld, and the Rhine, and ſoon filled the whole extent of Lower Germany.

Gaul, according to Ptolemy, was divided into four provinces, *viz.* Aquitania, Lugdunenſis, Belgica, and Narbonenſis.

Gallia Narbonenſis, comprehending Dauphiné, Provence, and Languedoc, with a part of Savoy, was at firſt divided into Prima and Secunda, and afterwards into three provinces, *viz.* Narbonenſis Propria, Viennenſis, and Narbonenſis Secunda; to which were added, Alpes Maritimæ, and Alpes Graiæ. Narbonenſis Propria, ſince called Languedoc, was chiefly inhabited by two conſiderable tribes, *viz.* the "Volcæ Arecomici," cantoned in the vicinity of the Rhone, and "Volcæ Tectoſagæ," in the weſtern parts of the province.

The *Viennenſis*, which was a province extending from Maſſilia, or Marſeilles, along the left bank of the Rhone to the lake of Geneva, was inhabited by ſeveral ſmall tribes, among which were the Allobroges, who occupied the northern diſtrict of Dauphiné, with a ſmall part of Savoy; on the S. bounded by the Iſere, on the W. by the Rhone, and on the N. by an imaginary line drawn from Lyons to Geneva: —the Vocontii, a powerful tribe who inhabited the modern dioceſes of Vaiſon and Die, together with ſome neighbouring diſtricts:—the Segalauni, poſſeſſing an inconſiderable territory near the Rhone, below the influx of the Iſere, ſince called the duchy of Valentinois:—the Tricaſtini, whoſe capital, Senomagus, now St. Paul des Trois Chateaux, lay on the left hand of the Rhone, 15 miles northward of Orange: —and the Cavares, who peopled the ſouth part of Comtat Venaiſſin, together with the principality of Orange in Provence.

Narbonenſis Secunda was occupied by the territories of the Salues, or Saluvii and Salices, a tribe of the Ligures, which reached from the ſprings of the Durance to the gulf of Lyons, and from the ſettlements of the Cavares to the Alps.

Alpes Maritimæ conſiſted of a mountainous territory on the eaſtern border of Provence, terminating at the mouth of the Varus, or Var, a ſmall river conſidered as the boundary of Gaul and Italy.

Gallia Lugdunenſis, ſo called from Lugdunum its capital, and ſometimes Celtica, from Celtæ, the general appellation of its inhabitants, extended from the Rhone weſtward to the ocean; on the S. bounded by Aquitania, and on the N. by Belgica. It was divided into Prima, Secunda, Tertia and Quarta.

Lugdunenſis Prima comprehended almoſt the whole of the modern provinces of Lyonnois, Nivernois, and Bourgogne; and was peopled by the Seguſiani, planted between the Rhone and the Loire:—the Ædui, one of the moſt powerful and opulent nations in Gaul, and ſtyled the friends of the Romans, who occupied the ſouthern parts of Bourgogne and Nivernois, *viz.* the dioceſes of Autun, Challon, Maçon, and Nevers;—and the Lingones, a conſiderable tribe, denominated by Pliny Roman allies, who eſtabliſhed themſelves on the right of the Saone, near the ſource of the Marne, in the dioceſe of Langres, formerly including that of Dijon.

Lugdunenſis Secunda was nearly of the ſame extent with Normandy, and was peopled by the Veliocaſſes, on the right hand of the Seine, in the dioceſe of Rouen:—the Caleti, on the S. coaſt called Littus Saxonicum, N. of the mouth of the Seine, in the diſtrict of Caux:—the Lexovii on the ſea-coaſt, on the left of the Seine, between the Carnutes and Viducaſſes:—the Aulerci Eburovices, above the Lexovii, on the left hand of the Seine:—the Saii, to the weſtward of the Aulerci, near the S. border of Normandy, in the dioceſs of Seez:—the Viducaſſes, a colony of the Ædui, below the Saii, on the Orne, in the dioceſe of Baieux:—the Bajocaſſes, on the ſea-coaſt, in a diſtrict watered by the Aure:—the Unelli, or Venelli, planted along the weſt coaſt of Normandy:—and the Abrincatui, who poſſeſſed a ſmall diſtrict, now called Avranchin, near the ſouth-weſt extremity of Normandy.

Lugdunenſis Tertia comprehended the provinces ſince called Bretagne, Maine, and Anjou, with a part of Touraine; inhabited by different tribes, of which the moſt conſiderable were the Turones, whoſe capital is now Tours on the Liger, or Loire, or was near that city:—the Andes, or Andecavi, in Anjou:—the Aulerci Cenomani, in the dioceſe of Mans:—the Diablintes or Diaulitæ, in Maine:—the Arvii, in the S.W. diſtrict of Maine, on the border of a river which falls into the Sarte:—the Redones in the dioceſes of Rennes, St. Malo, and Dol in Bretagne:—the Namnetes, in the dioceſe of Nantes, between the Andecavi and the ſea-coaſt, on the north ſide of the Loire:—the Veneti, in a territory called by Cæſar Venetia, now Vannes, ſeparated from the Namnetes by the river Herius, or Vilaine:—the Curioſolites, or Cariofuelites, on the E. bounded by the Redones, S. by the Veneti, W. by the Oſiſmii, N. by the ſea, in the dioceſes of St. Brieuc and St. Malo:—the Oſiſmii, on the N.W. coaſt of Bretagne, in the dioceſes of Quimper and Leon:—and the Coriſopiti, of whom no mention occurs before the 5th century, in the S.W. corner of Bretagne.

Lugdunenſis Quarta, or Senonia, included part of Orleanois, of Iſle de France, and of Champagne. It was peopled by the following tribes, *viz.* the Senones, a brave nation in an extenſive territory, on the left hand of the river Sequana or Seine, in the dioceſes of Sens and Auxerre:— the Carnutes, an ancient and powerful tribe, in Orleanois, between the Seine and the Loire:—the Pariſii, N. of the Carnutes

nutes and Senones, in the middle of Iſle de France :—the Aureliani, S. of the Carnutes and W. of the Senones, in a diſtrict of Orleanois, traverſed by the Loire :—the Meldi, in the dioceſe of Meaux :—and the Tricaſſes, Tricaſſini, or Treci, in South Champagne.

Aquitania Prima comprehended ſeveral inland modern provinces, *viz.* Berri, Marche, Auvergne, Limoſin, Quercy, Rouergue, and a portion of Languedoc ; and was inhabited by the Bituriges, in Berri, to the weſtward of the Loire : —the Arverni, a powerful tribe in Auvergne, extending in the time of Strabo from Marſeilles to the Pyrenees, and from the ocean to the Rhine ; but their territory is now repreſented by the dioceſes of Clermont and St. Flour :—the Lemovici, in Limoſin :—the Cadurci, in Quercy, on the river Oltis or Olt, called in the middle age Cadurcinum :—the Ruteni, in Rouergue :—and the Gabali and Vellavi, or Velauni, S. of the Arverni, in the weſtern part of Languedoc.

Aquitania Secunda extended ſouthward along the coaſt from the Loire to the Garonne ; and was peopled by the Bituriges Vibiſci, near the mouth of the Garonne in Bourdelois :—the Meduli, in Medoc, a ſmall diſtrict between the lower part of the Garonne and the ocean :—the Petrocorii, in Perigord, to the right of the lower part of the Garonne :—the Nitiobriges, or Nithobroges, in a territory watered by the Olt or Lot, and more extenſive than the dioceſe of Agen, in Guienne :—the Santones, N. of the Garonne, along the ſea-coaſt in the dioceſes of Saintes and Angouleme, and territory of Aunis :—the Pictavi, or Pictones, planted between the Santones, and the river Loire, in Poitou :—and the Ageſinates, an inconſiderable tribe, whoſe name may be recognized in Aiſenai, an archdeaconry in the dioceſe of Lucon. See AQUITANIA.

Novempopulana, the ſouth-weſt corner of France, between the river Garonne and the Pyrenean mountains, was inhabited by the Eluſates, who occupied the N.W. diſtrict of Armagnac :—the Auſci, in Armagnac Cliberris, now Auch, on the river Ger, which runs northward, and falls into the Garonne above Agen :—the Sotiates, in Sos, a diſtrict of Condomois :—the Lactorates, N. of the Auſci, on the left hand of the Garonne :—the Vaſates, in the dioceſe of Bazas : —the Boii, in the vicinity of the river Sigmanus, now Archachon, a ſmall baſon on the ſea-coaſt, into which the Loire falls, about 30 miles S.W. of Bourdeaux :—the Tarbelli, along the ſea-coaſt between the ſettlements of the Boii and Pyrenean mountains :—the Bigerrones, in the dioceſe of Bigorre, at the foot of the Pyrenees :—the Convenæ, in the dioceſe of Cominge :—and the Conſoranni, in the dioceſe of Conſerans, on the border of Languedoc.

Gallia Belgica, or Belgic Gaul, was bounded, according to the diviſion of Cæſar, on the W. by the Seine, on the E. by the Rhine, on the N. by the ocean, and to the S. undefined. Auguſtus added to this province the Sequani and Helvetii, who had formed a part of Gallia Celtica. Belgia Propria, diſtinguiſhed from Belgica, as a part from the whole, included the ſettlements of the Bellovaci, Atrebates, and Ambiani, and reached to the ſea-coaſt. Gallia Belgica was divided into Prima and Secunda, Germania Prima and Secunda, and Maxima Sequanorum.

Belgica Prima comprehended the greater part of Loraine and Treves, beſides ſome adjacent diſtricts ; and was inhabited by the Treveri, in the electorate of Treves :—the Mediomatrices, who anciently occupied a very extenſive territory, but after the conqueſt of Gaul by Cæſar, they cannot be traced beyond their ſettlements in Belgica Prima. In the middle age Pagus Metenſis was of the ſame extent with the dioceſe of Metz :—the Leuci, in Loraine, S. of the Mediomatrices, on the Moſelle, towards Mons Vogeſus, now Mont de Vauge :—and the Verodunenſes, in Loraine, N. of the Leuci, on the river Moſa, or Meuſe.

Belgica Secunda was ſituated between the river Meuſe and the Britiſh channel ; and was occupied by the Remi, in the dioceſe of Laon, or N. part of Champagne :—the Catalauni, in the middle of Champagne :—the Sueſſiones, in the N. diſtrict of Iſle de France :—the Veromandui, N. of the Sueſſiones, in the N.E. part of Picardy :—the Bellovaci, a numerous and powerful tribe, whoſe territories extended beyond the dioceſe of Beauvais :—the Silvanectes, on the left bank of the Oiſe, oppoſite to the Bellovaci :—the Ambiani, planted near the bank of the Samara, or Some, who held a diſtinguiſhed rank among the Belgic tribes :—the Atrebates, N. of the Ambiani, in Artois :—the Morini, in a maritime territory, which comprehends the dioceſes of Boulogne and St. Omer :—and the Nervii, a brave and powerful tribe, in the ancient dioceſe of Tournay, which included thoſe of Gand (Ghent) and Bruges, and reached to the ſea-coaſt.

Maxima Sequanorum included Franche Comté and a great part of Switzerland. It was occupied by the Sequani, the Helvetii, and the Rauraci ; which ſee reſpectively.

Germania Prima, or *Superior*, was a tract on the left bank of the Rhine, ſince called Alſace ; and was inhabited by the Triboci, who occupied the dioceſe of Straſburg :—the Nemetes, ſituated between the Vangiones and Triboci, in the biſhopric of Spire, in Lower Alſace :—the Vangiones and Carcates, N. of the Nemetes, in the palatinate of the Rhine.

Germania Secunda, or *Inferior*, on the left bank of the Rhine, comprehended the duchy of Juliers, Luxembourg, Limbourg, Liege, and Brabant ; and was occupied by the Ubii, in the electorate of Cologne :—the Gugerni, a remnant of the Sicambri eſtabliſhed by Auguſtus on this ſide of the Rhine, in a territory formerly occupied by the Menapii, between the Ubii and Batavi, in the ſmall diſtricts of Gueldres and Cleves :—the Eburones, in Liege and Limbourg, on both ſides of the Meuſe, who, after being exterminated, were ſucceeded by the Tungri :—the Sunici, Condruſi, Segni, and Paemani, in conſiderable tribes, which were cantoned along the ſkirts of Arduenna :—the Menapii, who occupied a territory ſometimes called Pagus Monapiſcus in Brabant, N. of the Toxandri, who were planted in the S. part of Brabant between the Scheldt and the Meuſe :—and the Batavi, a branch of the Catti, who, being expelled their country, ſettled on the extremity of the coaſt of Gaul, and in an iſland formed by two branches of the Rhine and the ſea. See BATAVI.

It is extremely difficult to diſtinguiſh the various tribes with which Gaul was peopled in the time of Cæſar, of Tacitus, or of Ptolemy. Modern nations are fixed and permanent ſocieties ; but the tribes of Germany and Gaul were fluctuating aſſociations of ſoldiers and ſavages : ſo that the ſame territory often changed its inhabitants in the tide of conqueſt and emigration. The ſame communities, uniting in a plan of defence or invaſion, beſtowed a new title on their new confederacy. The diſſolution of an ancient confederacy reſtored to the independent tribes their peculiar but long-forgotten appellations. A victorious ſtate often communicated its own name to a vanquiſhed people. Sometimes crowds of volunteers flocked from all parts to the ſtandard of a favourite leader : his camp became their country, and ſome circumſtances of the enterpriſe ſoon gave a common denomination to the mixed multitude. The diſtinctions of the ferocious invaders were perpetually varied by themſelves, and confounded by the aſtoniſhed ſubjects of the Roman empire. Gibbon's Hiſt. Rom. Emp. v. 1.

The following *Table*, extracted from Playfair's Geography, exhibits

exhibits a comparative view of the ancient and modern political diviſion of Gaul.

Roman Provinces under Auguſtus.	Provinces under the French Monarchy.
1. Narbonenſis, I^ma . .	Languedoc, Conſerans, Comté de Foix, Rouſſillon.
2. Narbonenſis, II^aa. . .	Part of Lower Provence,
3. Alpes Maritimæ . . .	——— Upper Dauphiné, ——— Eaſtern Provence, Nice, Monaco.
4. Lugdunenſis, I^ma. . .	Lyonois, Nivernois, Burgogne, Beaujolais, Forez, Part of Champagne.
5. Lugdunenſis, II^da. . .	Normandie, Vexin Français.
6. Lugdunenſis, III^a. .	Bretagne, Maine, Anjou, Touraine.
7. Lugdunenſis, IV^a. .	Mantois, Chartrain, Iſle de France, Brie, Part of Champagne, ——— Bourgogne, ——— Nivernois, ——— Orleanois.
8. Aquitania, I^ma. . . .	Berri, Marche, Limouſin, Part of Poitou, Bourbonnais, Auvergne, Velay, Gevaudan, Rouergue, Alby in Languedoc, Quercy.
9. Aquitania, II^a. . . .	Part of Poitou, Angoumois, Saintonge, Perigord, Bordelais, Agenois,
10. Novempopulana . .	Landes, Bazadois, Condomois, Comminge, Bigorre, Bearn, Navarre, Gaſcogne.
11. Gallia Belgica, I^ma.	Territory of Treves, ——— Luxembourg, Duchy of Gueldre, Meſſin, Toulounais, Lorraine, Barrois.
12. Belgica, II^a.	Laonois, Beauvoiſis, Noyonnais, Picardie, Artois, Flandre.
13. Maxima Sequanorum	Part of Bourgogne, ——— Franche Comté, ——— Switzerland.
14. Germania, I ^ma. . .	Electorate of Mentz, ——— Treves, ——— Palatinate, Worms, Spire, Alſace, Some diſtricts in Swabia and in Switzerland.
15. Germania, II^a. . . .	United Provinces, Part of Weſtphalia, &c.
16. Gallia Viennenſis . .	Savoy, Vivarais, Dauphiné, Comtat-Venaiſſin, Part of Provence.

Playfair's Geog. vol. i. Anc. Un. Hiſt. vols. ix. xvi.

For a further account of Gaul, ſee FRANKS and FRANCE. For its principal mountains, ſee ALPS; and an account of its rivers will be found under their ſeveral appellations, *Garamna*, *Sequana*, &c. or their Engliſh names, *Garonne*, *Seine*, &c. For an account of the original inhabitants of Gaul, their government, language, religion, &c. we refer to the articles CELTS and DRUIDS. After the conqueſt of Gaul by the Romans, its hiſtory will be blended with that of *Rome*, which ſee. See alſo the biographical articles AUGUSTUS and CÆSAR.

GAULAN, GAULON, or *Golan*, a town of Paleſtine, on the other ſide of Jordan, the capital of Gaulonitis, which was a diſtrict belonging to the half-tribe of Manaſſeh (Deut. iv. 43.), and extending from Peræa quite to Lebanon. This city was given to the Levitical tribe, of the family of Gerſhon, and became a city of refuge. (Joſh. xxi. 27.) It was the birth-place of Judas Gaulonites, chief of the Herodian ſect.

GAULEN, in *Geography*, a river which riſes in the north part of Norway, and, after a courſe of about twenty leagues weſtward, runs into the ſea about a league W. from Drontheim. In the year 1344 this river ſeemed to be drained; but by ſome means it paſſed under ground, from whence it emerged, and deſtroyed ſeveral churches, 48 farm-houſes, and 250 perſons.

GAULLY, a river of America, in Virginia, which riſes in a ſource that is unknown, and runs into the Kanhawa above the falls on the eaſtern ſide. N. lat. 37° 57'. W. long. 80° 58'.

GAULONITÆ, among the *Jews*, the name of a faction rather than a religious ſect, the ſame with the *Galilæans*. This political faction was raiſed up and headed by Judas Gaulonites, or Judas of Galilee, who is mentioned Acts, v. 37. Joſephus has called him in one place (Antiq. l. 18. § 1. p. 869. ed Haverc.) Judas Gaulanites, and in another place (Id. l. 20. c. 1. § 2. p. 965.) Judas of Galilee. Judas the Gaulonite and Judas of Galilee were, therefore, the ſame perſon;

called by one or other of theſe names, becauſe Gaulona or Gaulonitis, his native country, which lay beyond Jordan, was otherwiſe called Galilee, or Galilee of the Gentiles, to diſtinguiſh it from the other Galilee on this ſide of Jordan. (See GALILEE.) This Judas had raiſed and headed an inſurrection againſt the Roman government, on occaſion of the tax which Auguſtus levied on Judæa, when he reduced it into the form of a Roman province. Judas became popular by either firſt broaching or reviving the principle, that the Jews ought to obey none but God; and we learn from Joſephus (De Bell. l. ii. c. 8. § 1.) that Judas roufed their rebellious ſpirit, by charging them with meanneſs, if they could endure to pay tribute to the Romans, and acknowledge mortal men for their lords, after God had been their king. But notwithſtanding the pretenſions of Judas, the Jews had before this time been ſubject to mortal lords; for they had been tributary to the Romans in the reign of Herod; and even before Herod's reign, they had paid tribute to the Romans: for Joſephus ſays (Ant. l. xiv. c. 11. § 2.) that "Caſſius impoſed a heavy tribute upon the people (in Syria); and in particular bore very hard upon Judæa, exacting of them 700 talents of ſilver." The Gaulonite faction was ſoon ſuppreſſed; and we read no more of it in the New Teſtament, unleſs, as ſome have conjectured, thoſe perſons belonged to it, who were otherwiſe called Galileans, and whom Pilate ſlew as they were performing the ſacred rites at the altar, thus mingling their blood with their ſacrifices. Luke, xiii. 1.

GAULONITIS. See GAULAN.

GAULTHERIA, in *Botany*, named by Kalm in honour of a French phyſician ſettled in Canada, whoſe name was really *Gautier*, and who wrote an account of the ſugar obtained from the maple, *Acer ſaccharinum*, publiſhed in the Mem. etrangers de l'Acad. des Sciences de Paris, v. 2. 378, according to Dryander's Bibl. Banks, v. 3. 565.—Linn. Gen. 220. Schreb. 295. Willd. Sp. Pl. v. 2. 616. Ait. Hort. Kew. v. 2. 71. Mart. Mill. Dict. v. 2. Juſſ. 161. Lamarck Illuſtr. t. 367. Gærtn. t. 63.—Claſs and order, *Decandria Monogynia*. Nat. Ord. *Bicornes*, Linn. *Ericæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, permanent, of one leaf, five-cleft, bell-ſhaped; its ſegments half-ovate. *Cor.* of one petal, ovate, ſlightly five-cleft; limb ſmall, revolute. Nectary of 10 awl-ſhaped, erect, very ſhort bodies, ſurrounding the germen between the ſtamens. *Stam.* Filaments 10, awl-ſhaped, incurved, ſhorter than the corolla, inſerted into the receptacle; anthers with two cloven horns. *Piſt.* Germen ſuperior, roundiſh, depreſſed; ſtyle cylindrical, the length of the corolla; ſtigma obtuſe. *Peric.* Capſule roundiſh, obtuſely pentagonal, depreſſed, of five cells and five valves, opening at the top in five places, clothed all round with the perianth, become a roundiſh, coloured berry, open at the ſummit. *Seeds* numerous, nearly ovate, angular, bony.

Eſſ. Ch. Calyx inferior, five-cleft, permanent. Corolla ovate. Nectary of ten awl-ſhaped points. Capſule of five cells, clothed with the pulpy calyx.

1. G. *procumbens*. Linn. Sp. Pl. 565. Andr. Repoſ. t. 116.—Leaves obovate, pointed, ſlightly ſerrated, ſmooth, crowded about the tops of the branches. Stems aſcending, wavy, naked.—Found by Kalm in barren ſandy ground in Canada. It is eaſily cultivated with us in a light ſandy loam, with a mixture of peat earth, and is very hardy, bearing flowers and fruit moſt part of the year. The *roots* are moderately creeping. *Stems* procumbent in their lower part, then aſcending, ſubdivided, wavy, ſomewhat angular, ſmooth, woody, naked except about the top, where they bear a few ſcattered, evergreen, broadiſh obovate *leaves*, paler beneath, on ſhort thick ſtalks. *Flowers* axillary, ſolitary, ſtalked, drooping, white, with a reddiſh calyx, which becomes a ſcarlet ſpongy berry. Every part of the plant has more or leſs of an aromatic flavour, like ſyrup of capillaire, with ſome aſtringency. A few of the leaves are ſaid to communicate an agreeable perfume to tea. The two ſcales at the baſe of each flower are rather bracteas than an outer calyx, as appears by the analogy of other plants in this order, and their appearance after flowering.

2. G. *antipoda*. Forſt. Prod. 34.—"Leaves ſcattered, roundiſh, with tooth-like ſerratures. Stem ſhrubby, diffuſe."—Native of New Zealand. *Forſter*.

Mr. R. Brown, in his valuable *Prodromus*, v. 1. 559, has propoſed to augment this genus with the *Andromeda rupeſtris* of Forſter, and ſeveral American plants, hitherto referred to *Andromeda*. We have not had ſufficient opportunity to examine into the propriety of this meaſure. Another indubitable ſpecies, however, is

3. G. *erecta*. Venten. Jard. de Cels, t. 5.—Leaves ovate, pointed, finely ſerrated, ſcattered. Stem erect. Flowers in long hairy cluſters.—Native of Peru. *Ventenat*. It conſtitutes the underwood of the pine foreſts on the weſt coaſt of North America. *Mr. A. Menzies*. *Stem* ſhrubby, branched, leafy, erect, 18 inches to three feet high; the branches hiſpid. *Leaves* an inch and half or two inches long, broad-ovate, with minute ſharp ſerratures; dark-green and ſhining above; paler and roughiſh beneath. *Cluſters* three inches long, hairy, viſcid, with broad, concave bracteas. *Flowers* bright red, drooping. *Berry* red.—Ventenat ſays the late Mr. Cels received this ſhrub in 1792, and kept it in his greenhouſe. From Mr. Menzies' information, it may be preſumed capable of bearing our climate, and of growing under the ſhade of evergreens; a very deſirable property. We have not ſeen it alive in England.

GUALTIER, ST., in *Geography*, a town of France, in the department of the Indre; and chief place of a canton in the diſtrict of Le Blanc; 15 miles S.W. of Chateauroux. The place contains 962, and the canton 5,417 inhabitants, on a territory of 327½ kiliometres, in 10 communes.

GAULUS, in *Antiquity*, a ſhip of a roundiſh form, moſtly uſed by the people of Phœnicia.

GAULUS alſo ſignified a kind of cup.

GAUN, a term provincially applied to the gallon meaſure, and ſometimes to a ſmall tub.

GAUNA, in *Ancient Geography*, a town of Aſia, in Media. Ptol.

GAUNERSDORFF, in *Geography*, a town of Auſtria, 16 miles N.N.E. of Vienna.

GAUNLASSE, a river of England, in the county of Durham, which runs into the Wear at Biſhop's Auckland.

GAVNOE, in ſmall iſland of Denmark, near the S.W. of Zealand. N. lat. 55° 12'. E. long. 11° 53'.

GAUNT-BELLIED, in *Rural Economy*, a term applied to ſuch animals as are drawn up ſmall or thin in their bellies: when horſes have this appearance, they are ſuppoſed to be waſhy, tender, and unhealthy, conſequently of but little value for hard labour, or any other purpoſe. In the removal of this ſtate there is ſeldom much to be accompliſhed, but ſuch animals ſhould be fed as little as poſſible with any ſort of dry fodder. Graſs and other kinds of moiſt food are conſtantly the moſt proper.

GAUNTLET. See GANTLET.

GAVOTTA, or GAVOTTE, derived from the *Gavots*, a people inhabiting a mountainous diſtrict in France, called Gap, in *Italian Muſic*, is a kind of dance, the air of which has two ſtrains, briſk and lively, and in common time: each of its ſtrains are played twice over; the firſt has uſually four or

eight bars, and the ſecond contains eight, twelve, or more, The time begins with a minim, or two crotchets, or notes of equal value, and the hand riſing; and ends with the fall of the hand upon the dominant, or mediant of the mode, never upon the final, unleſs it be a rondeau. And the laſt begins with the riſe of the hand, and ends with the fall upon the final of the mode.

The Gavots of Corelli, Albinoni, Vivaldi and others of the Italians, correſpond with theſe rules as far as they relate to the meaſure, the number of bars in each ſtrain, and the cadences; but in reſpect to the initial notes of the air they deviate from it; for they ſometimes begin with a whole bar, and ſometimes with an odd quaver. Cotgrave, in his Dictionary, defines Gavote a kind of Brawle, danced commonly by one alone.

GAVOTTA, *Tempo di*, is when only the time or movement of a gavotte is imitated, without any regard had to the meaſure or number of bars, or ſtrains. We often find parts of ſonatas which have this phraſe to regulate their motions.

GAUPP, JOHN, in *Biography*, an able divine and mathematician, was born at Lindau, in Swabia, in the year 1667. Here he received the early parts of his education, from whence, at the age of 15, he was ſent to Ulm. From Ulm he went to the univerſity of Jena, where he took the degree of M.A. and became a conſiderable proficient in mathematics. After this he ſpent ſome time in different German univerſities, improving himſelf in theology and mathematics, and then viſited Amſterdam and London. In 1693 he was admitted to the office of the miniſtry, in which he roſe to the ſtation of principal paſtor of Lindau, about the year 1728. As much of his time as he could ſpare from the duties of the paſtoral office he devoted to mathematical and philoſophical purſuits, and became a lecturer in theſe branches of ſcience. He ſoon attained ſuch a rank among the philoſophers of the age, as to be honoured by the correſpondence of many of the moſt learned mathematicians in foreign countries. He was a practical mechanic, as well as an able illuſtrator of the higher branches of ſcience, and many of the inſtruments which he made uſe of in his obſervatory, and in his experimental reſearches, were conſtructed by himſelf. He had begun the erection of an obſervatory, but death terminated his labours in 1738. He was the author of "Gnomonica Mechanica Univerſalis:" of various calendars, and calculations and deſcriptions of eclipſes: of other philoſophical treatiſes, and of ſermons. His Ephemerides and aſtronomical obſervations were received by the Royal Academies of Sciences at Paris and Berlin, and ſeveral of them were inſerted in the Memoirs of thoſe learned ſocieties. Moreri.

GAUR, or ZOUF, in *Geography*, a city of Aſia, and capital of a ſmall kingdom or ſtate, in the ſouthern part of Greater Bucharia, ſeparated by mountains from Cabul and Candahar. This city was taken by Mamood I., and in 1009 annexed with its territory to Ghizni. It is ſaid to be now ſubject to the kingdom of Candahar: 150 miles S.W. of Balk. N. lat. 34° 40'. E. long. 63° 54'. The mountains of Gaur on the N. and N.W. of Candahar, are probably the Paropamiſus of antiquity; and they have no connection with the chain of Caucaſus, as the ancients ſuppoſed.

GAURA, in *Botany*, from γαῦρος, *pompous* and *elated*; a tall ſhewy plant. Linn. Gen. 187. Schreb. 250. Willd. Sp. Pl. v. 2. 311. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 2, 4. Juſſ. 319. Lamarck Illuſtr. t. 281. Gærtn. t. 127.—Claſs and order, *Octandria Monogynia*. Nat. Ord. *Calycanthemæ*, Linn. *Onagræ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, ſuperior, deciduous; tube cylindrical, long, thickeſt at the baſe, containing four obſolete, oblong, attached glands; limb in four deep, oblong, acute, reflexed ſegments. *Cor.* Petals four, inſerted into the tube of the calyx, oblong, directed towards the upper ſide, equal, with narrow claws. *Stam.* Filaments eight, thread-ſhaped, broadeſt towards the extremity, with an obſolete, conical, nectariferous gland withinſide of the baſe of each; anthers oblong, verſatile. *Piſt.* Germen inferior, oblong, of four cells, with the rudiments of ſeveral ſeeds affixed to the central columnar receptacle; ſtyle thread-ſhaped, as long as the ſtamens; ſtigmas four, round, ovate, ſpreading. *Peric.* Drupa dry, ſquare, tapering at each end, its angles dilated and compreſſed, of four cells, three of which are uſually abortive. *Seed* ſolitary, oblong, angular.

Eſſ. Ch. Calyx four-cleft, tubular. Corolla of four petals, turned upward. Drupa dry, inferior, quadrangular.

1. G. *biennis*. Linn. Sp. Pl. 493. Curt. Mag. t. 389.—Leaves lanceolate. Stem herbaceous. Stamens and ſtyle pendulous.—Native of Virginia and Pennſylvania. A hardy biennial plant in our gardens, flowering from Auguſt to October, and when the autumn is favourable, propagating itſelf copiouſly by ſeed. The *ſtem* riſes to the height of ſix or eight feet, and is leafy, much branched. *Leaves* alternate, ſoft, bluntly toothed. *Flowers* extremely numerous, in denſe corymboſe terminal cluſters, elegantly conſpicuous on account of their red calyx and white petals.

2. G. *fruticoſa*. Jacq. Ic. Rar. v. 3. t. 457.—Leaves linear-lanceolate. Stem ſhrubby. Stamens and ſtyle direct.—Native of South America. Jacquin and Willdenow have well diſtinguiſhed this from the former, on account of its ſhrubby ſtem, ſmooth and narrow leaves; and flowers not a quarter ſo large, whoſe corolla is not ſo much expanded, and whoſe ſtamens and ſtyle are prominent, not pendulous. The colours of the parts agree.

The *Gaura mutabilis* of Willdenow and Cavanilles, figured in Curt. Mag. t. 388. by the name of *Oenothera anomala*, is, at beſt, a very doubtful *Gaura*. According to the account and figure of the ripe fruit in Cavanilles, Ic. v. 3. 30. t. 258, it ſeems indeed to agree; but the ſection of the germen in Curtis is rather that of an *Oenothera*, with which latter its flower perfectly accords. Curtis's hint of its being probably a genus diſtinct from both, is perhaps neareſt the truth.

GAURA, in *Geography*, a town of Peru, in the juriſdiction of Chançay, containing about 200 houſes, and two churches, ſituated in a fertile country, and watered by a river of the ſame name. Its chief commerce is in ſalt and ſalt beef.

GAURA *Mons*, in *Ancient Geography*, a mountain mentioned in the Itinerary of Jeruſalem, between Mons Seleucus, and Lucus, ſituated, as M. D'Anville conjectures, in Dauphiné.

GAURANUM PROMONTORIUM, a promontory of Aſſyria, near the mouth of the Tigris.

GAVRAY, in *Geography*, a town of France, in the department of the Channel, and chief place of a canton in the diſtrict of Coutances; 9 miles S. of Coutances. The place contains 1823, and the canton 14,806 inhabitants, on a territory of 162½ kiliometres, in 15 communes.

GAURBEND. See GHOURBEND.

GAURIANISI, a ſmall iſland in the Grecian Archipelago, W. of Andros. N. lat. 37° 52'. E. long. 24° 50'.

GAURITZ RIVER, a river of Africa, on the ſouth coaſt of the colony of the Cape of Good Hope, which is a collection of water from the Great Karroo plains, the Black mountains, and the chain that runs parallel and neareſt to the ſea-coaſt. The branches to the northward of this chain are periodical, but it flows to the ſouthward, throughout the year, though in the ſummer months with a very weak current. In the rainy ſeaſon it is conſidered as the moſt rapid

and dangerous river in the whole country. Its mouth opens into the ſea, where the coaſt is ſtraight, and it is croſſed by a bar of ſand, which, in ſummer, is generally dry.

GAURES, or rather *Gavres*, or *Gabres*. See GABRES.

GAURUS, in *Ancient Geography*, a mountain of Italy, in Campania.

GAUSAPHNA, a town of Africa Propria, named alſo *Gazauphala*. Ptol.

GAUSWANNY, in *Geography*, a town of Hindooſtan, in the circar of Gohud; 30 miles N.W. of Narna.

GAUT, or GHAUT, ſignifies in India either a paſs through mountains, or a landing place on the bank of a river; but in a more extenſive ſenſe it is applied to the mountains themſelves; and as the Myſore country is a kind of table land, or tract elevated above the reſt of the peninſula, the term is particularly applied to that country.

The *Gauts*, peculiarly ſo called, are ranges of mountains, which run along the eaſt and weſt coaſts of the Deccan; the latter being called by the natives the mountains of Sukhien. Theſe mountains riſe abruptly from the low country, particularly on the weſt ſide, towards the ſea, forming, as it were, a ſtupendous wall of mountains, and ſupporting, like a terrace, a vaſt extent of fertile and populous plains, which are ſo much elevated as to render the air cool and pleaſant. This elevated tract is continued not only through the Mahratta territories, but extends through the peninſula, to the ſouthern extreme of Myſore; and it is named "Balla-Gaut," through its whole extent, denoting literally the "Higher, or Upper Gauts;" or perhaps more correctly the countries lying *above* or *below* the Gauts. In the peninſula it is applied in contradiſtinction to "Payen-Gaut," or the "Lower Gauts;" but in the Deccan it ſeems to be uſed only as a proper name. Oppoſite to Paniany, on the weſtern coaſt, there is a break or interruption of the mountains, about 16 miles in breadth, occupied chiefly by a foreſt. Excluſively of this gap, the mountains of Sukhien extend from cape Comorin to Surat, at unequal diſtances from the coaſt; ſeldom more than 70 miles, and commonly about 40; and within one ſmall ſpace only. This range approaches within ſix miles. The ridge, which we are now deſcribing, does not terminate in a point or promontory, when it approaches the Tapty, or Surat river; but, departing from its meridional courſe, bends eaſtward, in a wavy line, parallel to the river, and is afterwards loſt among the hills, in the neighbourhood of Burhanpour. In its courſe along the Tapty, it forms ſeveral paſſes, or deſcents (that is, *gauts*) towards that river; whence the country into which the paſſes deſcend was originally named Candeiſh, or the low country. The ridge alſo ſeems to abate of its great height, after paſſing the parallel of Baſſeen, northward. (See BUGLANA.)

This famous Apennine marks, perhaps with more preciſion, as Mr. Rennell obſerves, than any other boundary whatever, the line of ſummer and winter, or rather of dry and wet, and extends 13 degrees of latitude. Although the preciſe altitude of theſe mountains has not been aſcertained, yet being from 3000 to 4000 feet, it is ſufficient for preventing the great body of clouds from paſſing over them; and accordingly the alternate N.E. and S.W. winds, called the monſoons, occaſion a rainy ſeaſon on one ſide of the mountains only: that is, on the windward ſide. It would appear, however, that during the firſt part of the rainy monſoon, on the Malabar coaſt, (*i. e.* May and June,) a conſiderable quantity of rain falls in the upper region, or table land of Myſore, &c.; but it is ſuppoſed that this weather is rather of the nature of the periodical rains within the tropics, than of the proper monſoons. Be this as it will, there is no doubt that great quantities of clouds paſs over the weſtern edge of the Gauts. But the quantity of rain that falls *above*, does not bear any kind of proportion to that which falls *below*, the Gauts. Mr. Rennell concludes that the region of the Gauts ſhelters only a particular tract; beyond which, the light and elevated clouds which paſs over it deſcend in rain. Madras is within the limits of the ſheltered tract, though at leaſt 300 miles to the leeward of the Gauts. It has been, till of late, a general opinion, that the Gauts extended from the Northern, or Bootan mountains, to cape Comorin; and occaſioned a diverſity of ſeaſons at one and the ſame time throughout all India. But the truth is, that different ſeaſons exiſt at the ſame moment, only in a part of the peninſula; for in the parallel of Surat the cauſe ceaſes; the S.W. wind, no longer oppoſed by a wall of mountains, carrying its ſupply of moiſture uninterruptedly, both far and near, over the whole face of the country. Rennell's Memoir.

GAUTHIER, or GAULTIER, JOHN BAPTIST, in *Biography*, was born at Louviers, in the dioceſe of Evreux, in the year 1685. He was from early life attached to the ſtudy of theology, but, in obedience to the wiſhes of his parents, he commenced the ſtudy of the law; finding, however, his diſlike to that ſtudy inſurmountable, he was permitted to follow his inclination, and entered, in the year 1704, on a courſe of theology, in the ſchools of the Sorbonne. Having finiſhed his early ſtudies, he was admitted to deacons' orders, and commenced a ſeries of catechetical lectures to young people, and of conferences for the inſtruction of junior eccleſiaſtics. His diligence and ability attracted the notice of M. le Normand, biſhop of Evreux, who took him into his family, where he applied himſelf to the ſtudy of eccleſiaſtical antiquities. In 1713, he was, by the intrigues of the Jeſuits, obliged to quit the dioceſe of Evreux, and was received into the houſe of M. de Langle, biſhop of Boulogne. By that prelate he was admitted into prieſts' orders, and after taking his degrees in law, he was nominated to the canonry of his cathedral: he afterwards made him his proctor, and vicar-general, becauſe Gauthier's ſentiments proved a bar to his elevation in the church. From this time M. Gauthier was the boſom friend of his patron and benefactor, who, in a great meaſure, ſubmitted himſelf to his advice in the concerns of his dioceſe. The biſhop likewiſe availed himſelf of his pen in various publications, particularly in the "Letters and Memoirs," which he printed during his diſpute with the archbiſhop of Rheims. Upon the death of M. de Langle, Gauthier entered into the ſervice of M. Colbert, biſhop of Montpellier, as librarian, a character which was intended to conceal the more intimate connection that ſubſiſted between them; for till the death of M. Colbert, Gauthier was his chief adviſer in all eccleſiaſtical matters, his private chaplain, and confidential ſecretary. He then went to Paris, where he ſpent the remainder of his days in literary employment. He died in 1755, in conſequence of an injury which he ſuſtained by the overthrow of a carriage as he was travelling from Evreux to Paris, when he was ſeventy-one years of age. His publications were extremely numerous, chiefly on theological ſubjects. The titles of them all are given in Moreri, to which the reader is referred.

GAUTTY, in *Geography*, a town of Bengal; 28 miles W. of Nagore.

GAUTUMPOUR, a town of Hindooſtan, in Oude; 20 miles W. of Corah.

GAW, in *Mining*, ſignifies a *Fault*, in parts of Yorkſhire and ſome other places. See that article.

GAWAITTAN, in *Geography*, a town of Pruſſia, in Samland; 7 miles W. of Goldap.

GAWILE, or GYALGUR, a town of Hindooſtan, in Goondwana; 20 miles N.N.W. of Ellichpour. N. lat. 21° 27′. E. long. 77° 58′.

GAWNAGH, LOUGH, a lake of Ireland, in the northern part of the county of Longford, near the borders of Cavan.

GAWRAH, a town of Hindooſtan; 5 miles N.E. of Benares.—Alſo, a river of Aſia, which riſes in the mountains of Kemaoon, and runs into the Ganges with the Ramgonga.

GAWSE, or GAWZE, in the *Manufactures*, a very thin, ſlight, tranſparent kind of ſtuff, woven ſometimes of ſilk, and ſometimes only of thread.

To warp the ſilk for making of gawze, they uſe a peculiar kind of mill, upon which the ſilk is wound: this mill is a wooden machine, about ſix feet high, having an axis perpendicularly placed in the middle thereof, with ſix large wings, on which the ſilk is wound from off the bobbins, by the axis turning round.

When all the ſilk is on the mill, they uſe another inſtrument to wind it off again on two beams: this done, the ſilk is paſſed through as many little beads as there are threads of ſilk: and thus rolled on another beam, to ſupply the loom.

The gauze-loom is much like that of the common weavers, though it has ſeveral appendages peculiar thereto. See LOOM.

There are figured gauzes; ſome with flowers of gold and ſilver, on a ſilk ground, theſe laſt are chiefly brought from China.

GAWZYGUR, in *Geography*, a town of Hindooſtan, in the circar of Gohud; 30 miles N.W. of Narwa.

GAY, a term ſignifying ſpeckled or light coloured in cattle.

GAY, JOHN, in *Biography*, an eminent Engliſh poet, was born in 1688, at Barnſtaple, in Devonſhire, where he was educated with a view to trade. He was accordingly put out as an apprentice to a ſilk-mercer, in London. He ſoon ſhewed an utter diſlike to the duties enjoined on him in this ſituation; and in a few years a mutual ſeparation took place between him and his maſter. From this time he ſeems to have devoted himſelf to poetical compoſition; and, in 1711, he publiſhed his "Rural Sports," inſcribed to Pope. This compliment, joined to the excellent temper of Gay, laid the foundation of mutual friendſhip, which death only could divide. In 1712, Gay accepted the offer of reſiding with the ducheſs of Monmouth, in quality of her ſecretary: this ſituation afforded him ſufficient leiſure to purſue the bent of his own inclinations, and in the courſe of the year he gave to the world a poem, entitled "Trivia, or the Art of walking the Streets of London." This little work diſplayed in a ſtriking manner the talent which its author had for making obſervations, and which gave him an originality beyond what his powers of invention, properly ſo called, could have effected. About the ſame time, he engaged in dramatic writing. The "Mohocks, a tragi-comical farce," was attributed to his pen; and he brought out a comedy, called "The Wife of Bath." In 1714, Gay appeared as the advocate of his friend Pope, in a diſpute between him and Ambroſe Phillips, reſpecting the merits of their paſtorals: thoſe of Pope were written in poliſhed, and thoſe of Phillips in the ruſtic ſtyle. Gay, to ſerve his friend, undertook to compoſe a ſet of burleſque paſtorals, in which the manners of the country ſhould be exhibited in their natural coarſeneſs, with a view of proving, by a ſort of carricature, the abſurdity of Phillips' ſyſtem of paſtorals. His work was entitled "The Shepherd's Week," as the ſix pieces of which it conſiſted were denominated by days of the week. They proceed through the common topics of a ſet of paſtorals in a humorous ſtrain of parody; nevertheleſs his pictures of rural life and its accompanying ſcenery were ſo natural and amuſing, and intermixed with circumſtances ſo truly beautiful and touching, that they proved the moſt popular works of the kind in the Engliſh language. Gay dedicated his work to lord Bolingbroke; and at this period he ſeems to have enjoyed a large ſhare of favour from the Tory party then in power. He was appointed ſecretary to the earl of Clarendon, in his embaſſy to the court of Hanover. Upon the death of the queen his proſpects were damped; but he made ſome efforts to obtain the favour and patronage of the new family; the experiment did not ſucceed. He wrote a poetical epiſtle upon the arrival of the princeſs of Wales, which compliment procured him the honour of the attendance of the prince and princeſs, at the exhibition of his next dramatic piece. Gay had many friends among perſons of rank and opulence, and he was generally eſteemed for the excellent qualities of his heart, yet nothing was done towards fixing him in a ſtate of independence. He publiſhed a collection of poems, in 1720, by ſubſcription, by which he gained a thouſand pounds, and a preſent of ſome ſouth-ſea ſtock from Craggs, ſecretary of ſtate, which raiſed his hopes of fortune to a conſiderable height; but by refuſing to ſell his ſtock at the critical period, he loſt the whole, and was ſo dejected by his diſappointment as to be thrown into a dangerous ſtate of ill health. He retired to Hampſtead for the air; and by this and the kindneſs of his friends he recovered, and wrote the tragedy of "The Captives," which was acted in 1723. His next work was his "Fables," written profeſſedly for the inſtruction of the duke of Cumberland, to whom it was dedicated. This was publiſhed in the year 1726. A ſecond part of the Fables, directed to political ſubjects, was publiſhed after Mr. Gay's death, but it did not take with the public; whereas the Fables, properly ſo called, have been reprinted in almoſt a thouſand different forms. The poet naturally expected a handſome reward for this performance; but upon the acceſſion of George II., though not wholly forgotten, he was offered nothing better than the poſt of gentleman-uſher to the young princeſs Louiſa, which he declined, by ſaying he was too old for ſuch a place. Solicitations were made afterwards in his behalf, but he was ſtill unſucceſsful, and his hopes at court came to an end. He left the purlieus of the palace, and finding that he muſt depend on himſelf for his future ſupport, he began to deviſe plans for the purpoſe. In 1727, he brought out his famous "Beggar's Opera," which was refuſed at Drury-lane; but when it did appear on the ſtage, it was, after once or twice performing, received with unbounded applauſe: it was the leading topic of the town, and upwards of ſixty ſucceſſive repreſentations were inſufficient to ſatiate the metropolis. It was likewiſe acted with equal popularity at all our country theatres. "If," ſays an able critic, "the cauſe of this extraordinary ſucceſs be enquired, the anſwer is perhaps not very obvious. But it ſeems to indicate a kind of coarſeneſs in the national taſte, which could be delighted by the repetition of popular ballad tunes, and the delineation of ſcenes of vice and vulgarity, painted indeed in a natural ſtyle, and in their incidents appealing to the feelings implanted in every human breaſt. But if the Beggar's Opera obtained applauſe on the ſtage, it underwent more ſerious cenſure in other places than almoſt any dramatic piece that has

has been exhibited. By making a highwayman the hero, and bringing him off in a kind of triumph, the author has been charged with rendering the character of a freebooter an object of popular ambition; and by furniſhing his perſonages with a plea for their diſhoneſty, drawn from the univerſal depravity of mankind, and particularly of thoſe in offices of authority, he has been accuſed of ſapping the foundations of all ſocial morality. It cannot be denied that ſuch is the manifeſt tendency of the piece in its principles; but whether a mere ſpectacle is capable of producing important effects upon the public morals, may be queſtioned. That Gay himſelf had no miſchievous intentions in writing it, is highly credible; and his friend Swift warmly defended it as a wholeſome ſatire againſt the corruption of the times."

Government, it is imagined, thought unfavourably of the tendency of the Beggar's Opera, inaſmuch as they prevented the repreſentation of the ſecond part of it, which was written and publiſhed under the title of "Polly." For the injury which he ſuſtained in the ſuppreſſion of this piece, he was amply compenſated by the ſale of the publication, and by the patronage of the duke of Queenſbury, who took him into his houſe and ſhewed him every kindneſs. Raiſed above the preſſure, or the fear of want, he fell into a dejected ſtate of ſpirits, and was in other reſpects much out of health; but in the happier intervals, he produced his "Acis and Galatea," and the opera of "Achilles." He died in December, 1732, at the age of forty-four, ſincerely lamented by his friends; and his memory was honoured by a monument in Weſtminſter Abbey, where his remains were depoſited, and an epitaph was written by Pope. He poſſeſſed but little energy of mind, and had too much indolence to ſupport that independence, which he was ever deſirous of aſſerting. Gay was author of ſome other pieces beſides thoſe already noticed, and of two ballads generally known, *viz.* "All in the Downs," and "'Twas when the Seas were roaring." Biog. Brit. Lives of the Poets.

Gay *Head*, in *Geography*, a kind of peninſula, in America, on Martha's vineyard, between three and four miles in length, and two in breadth, and almoſt ſeparated from the other part of the iſland by a large pond. The Indians, inhabiting this part, lately numbered, amounted to 203. The ſoil is good, and with cultivation will produce moſt vegetables. Traces are perceived of former volcanoes on this peninſula. N. lat. 41° 20'. W. long. 70° 50'.

GAYA, or Kygow Gaya, a town of Moravia, in the circle of Hradiſch; 14 miles W.S.W. of Hradiſch. N. lat. 48° 59'. E. long. 17° 2'.

Gaya, a town of Hindooſtan, in the country of Bahar; 50 miles S. of Patna. N. lat. 24° 46'. E. long. 85° 8'.—Alſo, a river of Spain, from which Scipio formed an aqueduct to Tarragona.—Alſo, a ſmall iſland in the Eaſt-Indian ſea, near the eaſt coaſt of Borneo. N. lat. 4° 46'. E. long. 118° 48'.

GAYAC. See Guaiacum.

GAYACH, in *Geography*, a river of Bavaria, which runs into the Danube, 5 miles W. of Paſſau.

GAYETA, a town of Spain, in Valencia; 30 miles S. of Valencia.

GAYLAH, a town of Hindooſtan, in Oude; 8 miles S. of Banſey.

GAYMENT, Fr. has been ſaid to be equal to *Allegro*, Ital. chearful, lively, quick; but the French word, as Rouſſeau has well obſerved, is not ſo extenſive in its ſignification, being confined to chearful, light, airy ſtrains alone; whereas allegro extends to quick movements of all kinds of character and expreſſion.

GAZA, Theodore, in *Biography*, a learned modern Greek, who flouriſhed in the 15th century, was born at Theſſalonica. After the deſtruction of his native city, in 1430, by the Turks, he took refuge in Italy, and ſtudied the Latin language with ſuch diligence, that in three years he was ſo thoroughly acquainted with it as to become one of the moſt eloquent writers in his time. From 1441 to 1450 he was a profeſſor in the univerſity of Ferrara, and afterwards its principal rector. Before this he was in a ſtate of extreme indigence, and was obliged to copy Greek manuſcripts for a livelihood. From Ferrara he went into the ſervice of pope Nicholas V., and at the ſame time obtained the patronage of cardinal Beſſarion, who made him his confidential friend. Upon the death of the pope he was ſome time with king Alphonſo at Naples, upon whoſe deceaſe he returned to Rome. His patron cardinal Beſſarion procured him a rich benefice in Calabria, but being inattentive to his own affairs, he was ſtill in but depreſſed circumſtances. At the inſtance of Nicholas V. he undertook a tranſlation of Ariſtotle's work on animals, which was not finiſhed till the reign of Sixtus IV., to whom he preſented it, and expected no doubt a handſome remuneration, inſtead of which he was mortified with a preſent of fifty crowns only, which, it is ſaid, ſo enraged him that he actually threw the money into the Tyber. After this he returned to Ferrara, and from thence to Calabria, where it is probable he died in 1478. Gaza was one of the moſt learned men of his time, and his great talents have been celebrated by the principal ſcholars among his contemporaries. His works are "A Greek Grammar," printed by Aldus in 1495, together with his treatiſe "On the Grecian Months." Beſides the work already noticed of Ariſtotle, he tranſlated the Aphoriſms of Hippocrates: Theophraſtus on Plants: Ælian's Tactics: Dionyſius Halicarn. de Compoſitione Orationis: the Homilies of John Chryſoſtom, and ſome other works. He tranſlated Cicero de Senectute, and other pieces from Latin into Greek; and in the controverſy between the Platoniſts and Ariſtotelians he compoſed a work againſt the notions of the former. Gen. Biog.

Gaza, in *Ancient Geography*, one of the five Philiſtine ſatrapies or principalities, ſituated towards the ſouthern extremity of Canaan, about 15 miles S. of Aſcalon, four or five N. of the river Bezor, and at a ſmall diſtance from the Mediterranean. It was placed on an eminence, ſurrounded by beautiful and fertile vallies; watered by the above-mentioned river and a number of other ſprings, and, at a further diſtance, encompaſſed on the inland ſide with hills highly cultivated. It was ſtrong, on account of its ſituation, and alſo by means of the walls and ſtately towers that ſurrounded it. It was, however, taken by Caleb, then chief of the tribe of Judah, or aſſigned to this tribe by Joſhua; but ſoon after regained by its inhabitants; and held by them till Samſon carried off the gates of it in the night. (Joſh. xv. 47. 1 Sam. vi. 17.) It often changed maſters, and paſſed from the Philiſtines to the Jews, from them to the Chaldeans, who conquered Syria and Perſia, afterwards to the Perſians, who held it, when Alexander beſieged, took, and deſtroyed it. It was afterwards poſſeſſed by the kings of Egypt. Antiochus the Great took and ſacked it; it was taken ſeveral times from the Syrians by the Maccabees; taken and deſtroyed by Alexander Jannæus, king of the Jews; repaired by Gabinius; and given by Auguſtus to Herod the Great; but not ſubject to his ſon Archelaus. The evangeliſt Luke ſays (Acts, viii. 26.) that, in his time, Gaza was a deſert place. Some geographers make Gaza a ſea-port, confounding

ing it with New Gaza, or Majuma; and others place it at a great diſtance from the ſea. Calmet has erroneouſly made this diſtance 20 miles; whereas Arrian ſtates it at 20 furlongs or 2½ miles.

New Gaza, or Majuma, was the ancient ſea-port to the former, and on that account a place of ſome note; but much more ſo in the reign of Conſtantine the Great, who called it Conſtantia from the name of his ſon Conſtantius, and endowed it with many ſingular privileges, of which it was deprived by Julian the Apoſtate. Majuma ſtood near the mouth of the river Bezor, about 10 miles ſouth of Aſcalon, and as many N.W. of Anthedon; it has ſtill ſome curious antiquities remaining; but it is not eaſy to ſay whether they belonged originally to New or Old Gaza.

Gaza, now called by the Arabs "Razza," is compoſed of three villages, one of which, under the name of the "Caſtle," is ſituated between the two others, on an inconſiderable eminence. This caſtle is now a mere heap of rubbiſh. The Serai of the Aga, which conſtitutes a part of it, is in a ruinous ſtate; but it has the advantage of a moſt extenſive proſpect. From its walls may be ſeen the ſea, from which it is ſeparated by a ſandy beach, a quarter of a league wide; and the adjacent country reſembles Egypt, by means of its date trees, and flat aſpect; and in this latitude, the ſoil and climate both appear to be truly Arabian. The heats, the drought, the winds, and the dews, are the ſame as thoſe of the banks of the Nile; and the inhabitants have the complexion, ſtature, manners, and accent of the Egyptians, rather than thoſe of the Syrians. The ſituation of Gaza, by its convenience for commerce, has rendered it at all times a town of ſome importance. The ruins of white marble ſometimes found there prove that it was formerly the abode of luxury and opulence; nor was it unworthy of this preference. The black ſoil of the ſurrounding country is extremely fertile, and the gardens, watered by limpid ſtreams, ſtill produce, without art, pomegranates, oranges, exquiſite dates, and ranunculus roots, in great requeſt, even at Conſtantinople. It has, however, ſhared in the general deſtruction; and notwithſtanding its proud title of the capital of Paleſtine, it is no more than a defenceleſs village, peopled by at moſt only 2000 inhabitants. The manufacture of cottons is their principal ſupport; and as they have the excluſive ſupply of the peaſants and Bedouins of the neighbourhood, they employ about 500 looms. Here are likewiſe two or three ſoap manufactories. The commodity of aſhes, or kali, was formerly an article of conſiderable commerce; theſe aſhes are procured by the Bedouins, who burn the plants of the deſert; but ſince the Aga has monopolized this commodity, and the Arabs are compelled to ſell it at his price, they are no longer anxious to collect it; and the inhabitants, conſtrained to purchaſe at his pleaſure, neglect the manufacture of ſoap. Another branch of commerce, more advantageous to the people of Gaza, is furniſhed by the caravans, which paſs and repaſs between Egypt and Syria. The proviſions which they are obliged to take for their four days' journey in the deſert occaſion a conſiderable demand for their flour, oil, dates, and other neceſſaries. Sometimes they correſpond with Suez; they likewiſe fit out every year a great caravan, which goes to meet the pilgrims of Mecca, and conveys to them the convoy of Paleſtine, and ſupplies of various kinds. They meet them at Maon, four days' journey to the S.S.E. of Gaza, and one day's journey to the N. of Akaba, on the road to Damaſcus. They alſo purchaſe the plunder of the Bedouins, which is occaſionally an article of great value. Beyond Gaza there are only deſerts, with ſome cultivated ſpots and villages along the ſea-coaſt. Gaza, however, ſuffers, in common with other places, by the ſands which daily accumulate; inſomuch that many places which were anciently ſea-ports, are now four or five hundred paces within land; and this is the caſe with reſpect to Gaza. N. lat. 31° 25′. E. long. 35° 40′. In 1799 Gaza was taken by the French. Anc. Un. Hiſt. vol. ii. Volney's Travels in Egypt and Syria, vol. ii.

Gaza, or *Ganzaca*, *Tebriz* or *Tauris*, a town of Aſia, which held the firſt rank in Media Atropatena. It was the depoſitory of great wealth, and the ſummer reſidence of the kings of Atropatena. It was ſituated N.E. of the lake Spauta, and at ſome diſtance from it.

Gaza *Giovane*, in *Ornithology*, the name of a ſmall ſpecies of heron, of a fine white colour, the *Ardea Garzetta*. See Garzetta and Heron.

GAZALI, in *Biography*, ſurnamed *Abou Hamed Mohammed Zein Eddin Al Thouſi*, one of the moſt celebrated of the Muſſulmen doctors, was born at Thous, a town in Khoraſan, in the year 450 of the Hegira, or 1072 of the Chriſtian era. He was appointed profeſſor of the college founded at Bagdat, but ſoon relinquiſhed the duties of the ſituation for the ſake of embracing a life of retirement and ſtudy, and after having made a pilgrimage to Mecca, he returned to his native country, where he died in the year 504 or 505. He obtained a high reputation for learning and virtues, which occaſioned him to be diſtinguiſhed in the oriental manner by many magnificent titles. Being aſked what means he had uſed to arrive at that eminence in ſcience to which he had attained, he replied, "that he had never been aſhamed to aſk for information on ſubjects concerning which he had been ignorant." He was author of many works, but his principal production was entitled "The different Claſſes of the ſciences which relate to Religion." Gen. Biog.

Gaze-Hound. See Hound.

GAZEEDEEN, in *Geography*, a town of Hindooſtan; 14 miles E. of Delhi.

GAZELLA, or Gazelle, a ſpecies of *Antelope*, which ſee.

GAZER, or Gazara, in *Ancient Geography*, a town of Paleſtine, belonging to the tribe of Ephraim, ſituated on the torrent of Gaas, S.W. of Bethel. It was given to the Levites of the family of Kohath. (Joſh. xxi. 21.) In the time of Solomon, Pharaoh, king of Egypt, took and burnt it; but it was rebuilt by Solomon. At a future period, it was taken by Judas Maccabæus, and fortified by his brother Jonathan. Joſeph. Ant. l. xiii. c. 11.

Gazer, in *Geography*, a town of Africa, in the country of Aſben; 50 miles N. of Aſouda.

GAZETTE, a news-paper, or printed account of the tranſactions of divers countries, in a looſe ſheet or half-ſheet.

The word is formed from *gazetta*, a kind of coin, formerly current at Venice, which was the ordinary price of the firſt news-paper printed there: though others derive it, by corruption, from the Hebrew *izgad*, which ſignifies *nuntius*, a meſſenger, but this etymology is too much forced.

Gazettes, which moſt people look on as trifles, are by ſome held the moſt difficult kind of compoſitions that have appeared. They require a very extenſive acquaintance with the languages, and all the terms thereof, and a great facility and command of writing, and of relating with perſpicuity, and in a few words.

To write a gazette, a man ſhould be able to ſpeak of war both by land and ſea; be thoroughly acquainted with every thing relating to geography, the hiſtory of the time, and that of the noble families; with the ſeveral intereſts of princes, the

the ſecrets of courts, and the manners and cuſtoms of all nations.

Vignuel de Marville recommends a ſet of gazettes, well written, as the fitteſt books for the inſtruction of young perſons coming into the world.

The firſt gazette publiſhed in theſe parts, is ſaid to have been that of Paris, begun in the year 1631, by Theophraſt. Renaudot, a phyſician of Montpelier, in his office of intelligence.

The firſt gazette in England was publiſhed at Oxford, the court being there, in a folio half ſheet, Nov. 7, 1665. On the removal of the court to London, the title was changed to the "London Gazette." The Oxford gazette was publiſhed on Tueſdays, and the London on Saturdays; which have continued to be the days of publication ever ſince.

GAZETTE, *Extraordinary*. See EXTRAORDINARY.

GAZNA, in *Geography*. See GHIZNI.

GAZNIN, a town of Hindooſtan, in Candahar; 106 miles E. of Candahar.

GAZOLDO, a town of Italy, in the department of the Mincio; 13 miles W.N.W. of Mantua.

GAZOMETER, GASOMETER, or *Gas-holder*, are names given to certain inſtruments or veſſels formed as reſervoirs for large quantities of gas, to which are added ſuitable conveniences for receiving and applying the ſame, and for meaſuring the volume. Lavoiſier and Meuſnier were the firſt to deſign and execute ſuch an inſtrument, of which a plate, accompanied with a deſcription, was given in the Elements of Chemiſtry, publiſhed by the former celebrated philoſopher in 1789. This inſtrument was too complicated and expenſive to be of general uſe. Since that time various have been the alterations and improvements made by ſucceeding chemiſts according to the objects they had in view.

Lavoiſier's gazometer conſiſted of a cylindrical copper veſſel, open at bottom, and inſerted into another larger veſſel of the ſame kind, open at top. The internal veſſel is 18 inches in diameter, and 20 inches deep. Around the bottom of this, on its outſide, is fixed a border divided into compartments, intended to receive leaden weights, 1, 2, 3, 4, &c. in order to increaſe the weight of the veſſel when conſiderable preſſure is requiſite. The top of this veſſel is furniſhed with a tube and ſtop-cock, forming a communication between the external and internal air, alſo with a thermometer cemented into it to ſhew the temperature of the air within. The veſſel is ſupported by a chain from one of the circular ends of a balance beam; and to the other end a ſcale and weight are ſuſpended as a counterpoiſe. The external veſſel is partly filled with water, and has tubes along the bottom and riſing up to communicate with the air in the interior veſſel, for the purpoſe of admitting or diſcharging it. Some auxiliary glaſs tubes and a ſcale of inches are attached to the veſſel, to ſhew the height of the water in the inner and outer veſſel, and the difference of the heights, in order to correct for the preſſure. This partial deſcription will give an idea of the outline of the ſtructure, which is much too complicated to be exhibited as a model for the preſent time.

In the 12th vol. of the Annales de Chimie, 1792, is given the deſcription of a gazometer by Van Marum: the immediate object of it was to exhibit the compoſition of water by the ſlow combuſtion of hydrogen in a large glaſs receiver. Two of theſe gazometers were employed; the one to introduce a ſtream of hydrogen gas, and the other oxygen. The hydrogen was lighted at the commencement of the experiment by electricity. The apparatus diſplays ingenuity; but it is complicated and expenſive. In the 14th vol. of the ſame work he gives a ſimplification of the gazometer as applied to the ſame purpoſe; but it is ſtill too complex and too partial in application for general uſe.

In 1794, Mr. Watt of Birmingham publiſhed a pamphlet containing a deſcription of an apparatus for elaſtic fluids. In this he deſcribes two veſſels, the one under the name of *hydraulic bellows*, which is, in fact, the modern gazometer, and the other under the name of *air-holder*. Theſe were illuſtrated with plates. The hydraulic bellows or gazometer conſiſts of two veſſels H and J, *Plate* XIV. *(Chemiſtry) fig.* 1. The outer veſſel, H, conſiſts of two cylinders placed one within the other, and about half an inch aſunder. Theſe cylinders are joined together at bottom by a circular rim, well ſoldered to them both; and the inner cylinder is ſhut at top by a cover alſo ſoldered on. This inner cylinder is about two inches ſhorter than the outer cylinder, and the latter is ſurmounted by a cup, W W, about 1½ inch deep, and one inch all around more in diameter than the cylinder to which it is attached. The pipe, P Q, paſſes diametrically acroſs the veſſel H; the end, Q, is open, and made ſo as to be ſtopt with a cork or cock. From this pipe, P Q, proceeds a pipe V, which paſſes upwards through the cover of the inner cylinder to which it is ſoldered, and is open at its upper end. The ſecond veſſel, J, of the bellows, is a hollow cylinder of one foot diameter, and eighteen inches long, ſhut at top, and open at bottom; it is made ſo as to move up and down eaſily in the circular interſtice between the inner and outer cylinders of the veſſel H; and when that interſtice is filled with water, as high as the cover of the inner cylinder, if the veſſel J is moved up and down, it will act the part of a bellows, drawing in and blowing out air, by the pipes V and P Q. The bellows are made of tinned iron plates japanned, or of tinned copper-plates not japanned.

The air-holder is thus deſcribed: Let a cylindrical veſſel *(fig.* 2.) be made of ſtrong tin plate; this veſſel is to be cloſe at both ends, which are made concave outwards; cloſe to both the bottom and cover, ſhort pipes, U and V, proceed from the ſide of the veſſel; their diameters ſhould be the ſame as the pipe, P Q, of the bellows. Another pipe, T, paſſes through the middle of the cover or upper end of the veſſel, to which it is well ſoldered; and reaches within half an inch of the bottom. To guard this veſſel from ruſt it ſhould be japanned both inſide and out; and for the greater convenience of japanning it within, it may be made to come aſunder at the middle of its height, and when varniſhed may be cemented together by a mixture of wax and roſin uſed hot. When this veſſel is completed, the upper pipe, U, is to have a ſhort pipe, W, inſerted into it, which ſhould alſo fit the pipe, Q, of the bellows. The lower pipe, V, is then to be corked, and the veſſel filled with water by the central pipe T. This veſſel is to be placed in an empty tub, the pipe, W, inſerted into the pipe, Q, of the bellows, and cemented to it. When the bellows are filled with artificial air, the cork of the lower pipe, V, is to be taken out, and the counterpoiſe of the bellows is to be lifted up; the water in the air-holder will then run out into the tub, and the air deſcend from the bellows into the former veſſel, which, when full, muſt have its pipes cloſe corked. To transfer the air from this veſſel into a bag or bladder, fix the faucet or mouth-piece of the bag or bladder into the upper pipe U, and if you want a quart or gallon, or other meaſure of air, pour ſo much water into the air-holder through the central pipe, and exactly that quantity of air will iſſue out; then re-cork your veſſel until you want more air from it.

In the 5th vol. of the Philoſophical Magazine 1799, Mr. Pepys deſcribes a new mercurial gazometer. The principle of it is nearly the ſame as the hydraulic bellows of Mr. Watt. A *(fig.* 3.) is a repreſentation of the bell of the gazometer,

zometer, made of glaſs, furniſhed with a cock at top, and able to contain 34 ounces Troy of diſtilled water. The diviſions of capacity, determined by actual meaſurement, are marked on the glaſs with a diamond. B B, are the ſections of two cylinders of lignum vitæ (or caſt iron), the outward one ſcrewed upon the ſolid internal one, which is made to project at its lower extremity, and furniſhed with a male ſcrew, to work into a female ſcrew, with which the lower end of the external cylinder is furniſhed. The ſpace between theſe is ſo adjuſted as to be almoſt filled up by the ſubſtance of the glaſs bell, A, when dropped into it, ſo that the quantity of mercury neceſſary to fill up that ſpace is proportionally ſmall. The internal cylinder has a conducting tube up through its axis, the lower end of which is furniſhed with a female ſcrew anſwering to the male ſcrew of the cock of the ſmall receiver C. The receiver, C, is of glaſs, and open at the bottom. When this receiver is uſed, it is ſcrewed into its place, and reſts upon a ſmall cup or ciſtern of mercury, D, in which the beak of a retort, furniſhed with a bent glaſs tube, may be introduced into the receiver. E E E E ſection of a wooden ſtand upon which the cylinders of lignum vitæ or caſt iron are ſupported, having an opening through the top to permit the cock of the receiver, C, to be joined to the conducting tube of the internal cylinder B. The ciſtern, D, is adjuſted to its height by means of a riſing cylinder in the pedeſtal F. G is a transfer glaſs for mixing alkaline gaſes in vacuo, or other purpoſes, and when uſed, is joined to the top of the bell A. H, a glaſs globe and ſtop-cock, capable of holding 14 ounces Troy of water, for weighing gaſes; it receives its gas by being inverted and ſcrewed into the bell A. I, a bladder furniſhed with a ſtop-cock, to aſſiſt in holding, transferring, or mixing different gaſes. K, an elaſtic gum bottle capable of containing 30 ounces of water, for holding the acid gaſes; when uſed it is ſcrewed into the top of the transfer G; the bottom cock of the latter being at the ſame time joined to the bell A, previouſly charged with the alkaline gas; the cocks being turned, the gaſes ruſh together in vacuo. L, a ſmall portable air-pump for exhauſting the globe H. M, a double male ſcrew, which fits any part of the apparatus, and on which a valve may be faſtened. N, a double female ſcrew. O, a ſmall inſtrument, of ſervice in collecting ſpilled mercury, or transferring ſmall quantities of it.

Mr. Davy's Reſearches, &c. publiſhed in 1800, contain an account of a mercurial gazometer by Mr. Clayfield. The peculiarity of this conſiſts, in having the counterpoiſe to the cylinder ſuſpended by a ſtring which runs in a ſpiral groove ſo as to balance the cylinder, whatever its depreſſion in the mercury may be.

The 53d vol. of the Journal de Phyſique, 1801, contains a deſcription of a new gazometer by Victor Michelotti, M. D. of Turin. This inſtrument, however, can ſcarcely be recommended for its ſuperiority.

In the 13th vol. of the Philoſophical Magazine, 1802, Mr. Pepys has deſcribed a new gas-holder. The apparatus is in ſome reſpects ſimilar to that recommended by Mr. Watt. A ſmall circular ciſtern is added at top, which is connected with the gas-holder by means of two pipes furniſhed with cocks. It has alſo a braſs cock on the ſide, and a glaſs gage or regiſter tube, ſhewing the quantity of included gas by the level of the water. The following is a deſcription of the different parts, *fig.* 4. The gas-holder, G, may contain from two to ten gallons. R, the regiſter tube, the ends of which are cemented into two tin ſockets by corks at the top and bottom of the gas-holder, into which it opens at both ends; of courſe the level of the water in the apparatus will always be ſeen in the tube, and conſequently that of the gas. C, the circular ciſtern with its two cocks and pipes, marked 1 and 2. C *k* a braſs cock on the ſide, with a ſcrew, to which bladders or a blow-pipe may be attached. O, an opening into the gas-holder, in which a pipe is ſoldered at ſuch an angle, that when all the uppermoſt cocks are ſhut, no water can poſſibly eſcape. But when a conducting pipe from a retort or other apparatus generating gas, is introduced into this opening, then, as the gas paſſes up into the gas-holder, an equal quantity of water will be diſcharged at O into any veſſel fit to receive it. S *p*, a ſpout on the ſide of the ciſtern to enable the operator to add water, even when the receiver fills its whole area. H, H, handles to lift the gas-holder. R *c*, a glaſs deflagrating receiver, ſtanding in the ciſtern. A, its adopting cork and cock. S, a watch ſpring in a ſlit wire prepared for combuſtion. The wire paſſes through a cork. D, a deflagrating diſk of iron for ſulphur, phoſphorus, charcoal, ſugar, camphor, &c. B, a blow-pipe with a gum elaſtic tube, E, capable of joining the cock C *k*.

To make uſe of this apparatus; firſt fill the gas-holder with water, by cloſing the opening, O, with a cork, and alſo the cock, C *k*, and keeping the circular ciſtern full of water, while the cocks 1 and 2 are both open. The air is driven out of the gas-holder through the cock 1, by the water deſcending into it by the cock 2. When full, the water in the regiſter will be on a level with the top of the gas-holder. Then ſhut the cocks 1 and 2. You may now remove the cork from the opening, O, which is then prepared to receive the conducting pipe from any apparatus from which the gas is generating. As the gas is delivered the water eſcapes, and ſhould be caught in any convenient veſſel. The regiſter will then ſhew the quantity received; when full, cloſe the opening, O, with a cork wrapped in leather, which prevents the communication with the atmoſphere. It may now be eaſily removed or conveyed where it is wanted. When it is required to fill a glaſs receiver, as R *c*, with the gas, having previouſly filled the circular ciſtern with water, place it in the ciſtern, put in the adopting cork, A, and with the mouth applied to the cock, exhauſt the receiver in which the water will riſe till full. Then cloſe the cock, A, and open the two cocks, 1 and 2, and the gas will aſcend into the receiver, while the water will take its place in the gas-holder.

In the ſame volume of the Magazine Dr. Warwick ſuggeſts a more ſimple alteration of Mr. Watt's air-holder than the above. It conſiſts in having a rim at the top of Watt's air-holder, ſo as to admit of a column of water of an inch in depth above the ſtop cock, ſoldered to the ſhorter tube in the top of the air-holder.

In the 23d vol. of Nicholſon's Philoſophical Journal, 1809, Mr. Clegg has given a deſcription of a gazometer or gas-holder for receiving the gas from coals, for the purpoſe of lighting manufactories, &c. This is on a large ſcale, ſo as to hold ſeveral hundred cubical feet. The veſſel containing the air is made of wrought iron plates, and may be cylindrical, or, which is better, ſquare or oblong, with an internal frame of wood to preſerve the figure. This veſſel is balanced by a weight in the manner of other gazometers, and is let down into a large well or reſervoir of water, like the upper cylinder of Mr. Watt's hydraulic bellows. When in operation, a ſmall head of water preſſes on the gas, and forces it through the tubes to the lamps, where it is burned. As this apparatus is daily receiving improvement, we ſhall defer giving a full deſcription of it till the article GAS-*Light*. See alſo LIGHT.

Rules for reducing meaſures of gaſes to weights.—In order to reduce any given meaſure of a gas to weight, the exact

weight of a given volume at a certain preſſure and temperature muſt be previouſly known. This may be ſeen in a table under the article GAS. The mean preſſure of the atmoſphere may be taken at 30 inches of mercury, and the mean temperature at 55° of Fahrenheit. The reduction, on account of preſſure, ariſes from the principle that "the volume of any gas is inverſely as the preſſure." The reduction, on account of temperature, muſt be $\frac{1}{475}$th for every degree of Fahrenheit, between the limits of 32° and 80°. At leaſt this is a ſufficient approximation: that is, the volume muſt be *increaſed* if the temperature is below 55°, and *diminiſhed* if above 55°, by the fractional part above ſpecified.

Example 1.—Required the weight of 1000 cubic inches of common air in a mercurial gazometer; the mercury within being 2½ inches above the level of that without, the barometer at the ſame time being 29.5 inches, and the thermometer 62°

Solution.—Here the real preſſure of the gas is 29.5 — 2.5 inches = 27. Hence, 30 : 1000 :: 27 : 900 = the volume of gas reduced to 30 inches of preſſure. Again, 62° — 55° = 7°, and $\frac{7}{475}$ of 900 = 14.5, which being taken from 900, leaves 885.5 cubic inches of gas at the common preſſure and temperature. But 100 cubic inches weigh 31 grains; whence 885.5 × 31 = 274½ grains, as required.

Example 2—Required the weight of 1000 cubic inches of common air in a water gazometer; the water within being 3 inches below that without, the barometer at the ſame time being 29.8, and the thermometer 38°.

Solution.—Here the real preſſure of the gas is 29.8 + the preſſure of 3 inches of water; but 3 inches of water = $\frac{3}{13.6}$ inches of mercury = .22 inch. Whence the preſſure = 30.02. And 30 : 1000 :: 30.02 : 1000.7, the volume of gas reduced to 30 inches of preſſure. Again, 55° — 38° = 17°, and $\frac{17}{475}$ of 1000.7 = 39.1, which being added to 1000.7, gives 1039.8 cubic inches of gas at the common preſſure and temperature = 322⅓ grains.

GAZONS, in *Fortification*, turfs, or pieces of freſh earth covered with graſs, cut in form of a wedge, about a foot long, and half a foot thick, to line or face the outſides of works made of earth, in order to keep up the ſame and prevent their mouldering.

GAZOPHYLACIUM, in the *Jewiſh Antiquities*, according to the Greek etymology, of γαζα, *treaſure*, and φυλαττω, *I keep*, ſignifies the treaſury-chamber. There were ſeveral places in the temple of Jeruſalem, where the rich preſents conſecrated to God by kings, princes, or private perſons, were kept. But the ſignification of this word, gazophylacium, has been farther enlarged, ſo as to comprehend the rooms where the proviſions of the temple were laid up, both for ſacrifices, and for the ſupport and ſuſtenance of the prieſts, and in general this word is uſed for all the apartments of the temple. In the Goſpel, by gazophylacium is meant the cheſt into which people caſt their offerings at the entrance of the temple. It has been alſo uſed by naturaliſts for a collection of figures of curious ſubjects. Mark xii. 41, 43. Luke xxi. 1.

GAZOPHYLAX, Γαζοφυλαξ, in *Antiquity*, an officer who had the care and management of the treaſure belonging to the kings of Perſia.

GAZUA, in *Geography*, a mountain of Arabia; 60 miles E. of Mecca.

GAZUATI, a name given by the natives to a chain of mountains in the viceroyalty of La Plata, which is conſidered as terminating the wide plains or ſteppes called Pampas on the ſouth. It is called by the Spaniards La Vantana, and the eaſtern part is denominated the Volcan, from its form, as there is no indication of a volcano. It is ſuppoſed not to exceed 1000 feet in height.

GAZYPOUR, a circar, or province, of Hindooſtan, bounded on the north-eaſt by the Dewah, on the ſouth by the Ganges, and on the weſt by Benares and Jionpour; of a triangular form, and about 180 miles in circumference. —Alſo, a town, the capital of the forementioned circar, on the left bank of the Ganges; 92 miles E. of Allahabad. N. lat. 25° 36′. E. long. 84° 48′.

GAZZA, in *Ornithology*, the name of a ſpecies of *heron* (ARDEA *alba*), common in Italy, and called by many authors *ardea alba major*, the *greater white heron*. Its whole body is of a ſnow white, its beak yellow, its head ſmooth, its legs black, and the membranes about its eyes green; though called large in compariſon of the leſſer white one, it is ſmaller than the common grey heron. Its tail alſo is much longer, and has no creſt. It is ſometimes ſeen in England, and has been miſtaken for a common heron become accidentally white, as ſparrows and other birds ſometimes are. See HERON.

GAZZANIGA, GIUSEPPE, of Verona, in *Biography*, a diſciple of Sacchini, and an agreeable compoſer in the elegant and graceful ſtyle of his maſter. He has compoſed more comic than ſerious operas, and began to be noticed as a muſician of taſte and genius in 1771, when his burletta, intitled "La Locanda," excited the attention and hopes of the public, which have not been diſappointed. He was living in 1796, and compoſed operas, chiefly comic, for ſeveral cities of Italy.

GAZZETTA, in *Ornithology*, a name given by Geſner and others to a ſpecies of ſmall white heron, ſold in the markets of Italy, and ſeeming to be the *ardea alba minor* of authors, or *gaza giovane* of the Venetians. See GARZETTA and HERON.

GAZZETTO, in *Ichthyology*, the name of a fiſh of the turdus or wraſſe kind, (a ſpecies of *Labrus*, which ſee,) caught in the Mediterranean, and ſold in the markets of Italy. It is of a fine green colour, and is conſiderably thick, though broad; its fins are ſpotted, and it has a large purple tubercle near the anus. It has only one back-fin which has twenty-four ribs or nerves, the firſt fifteen of which are rigid and prickly, the reſt ſmooth and flexile.

GEA, in *Ancient Geography*, a town of Arabia, near Petra. Steph. Byz.

GEANNIDES, in *Natural Hiſtory*, a name given by ſome authors to the ſtone called by others encymonites. It ſeems to have been the ſame with our ſparry incruſtations on the tops of caverns, &c. but the word has been generally underſtood to mean the eagle-ſtone.

GEAR, or *about your gear*, at *Sea*, a command to work on all hands.

GEARON, or JAROON, in *Geography*, a town of Perſia, in the province of Farſiſtan, celebrated for its excellent fruits, raiſins, pomegranates, dates, and quinces; 70 miles S.E. of Schiras.

GEASTRUM, in *Botany*, from γεα, *the earth*, and αστηρ, *a ſtar*. Perſoon Syn. Fung. 131. (Geaſter; Mich. Gen. 220. t. 100.)—Claſs and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*; ſect. *Dermatocarpi*, Perſ.

Micheli founded this very natural genus on the Puff-balls with a ſtellated volva, *Lycoperdon ſtellatum* of Linnæus, and its allies. Perſoon, in adopting it, very properly altered the termination of the name, that it might not be a mere compound of another eſtabliſhed generic name, *Aſter*. He gives the following generic character.

Volva thin, evaneſcent. Outer coat of the *peridium* cloven

ſtar-wiſe, at length reflexed: orifice of the head uſually hairy.

We ſhould rather call this "outer coat" an inner volva, after Linnæus; the true *peridium*, or receptacle of the ſeeds, being the membranous round head, whoſe orifice is uſually hairy.—The ſpecies are ſix; among them are

G. *coliforme*, (Lycoperdon coliforme; Sowerby's Fung. t. 313. Dickſ. Crypt. faſc. 1. t. 3.), found only in ſome few places in Norfolk and Suffolk, remarkable for having numerous orifices in its head, and as many ſtalks to ſupport it.

G. *coronatum*, (Lycoperdon ſtellatum; Sowerb. Fung. t. 312. L. volvam explanaus; Schmid. Ic. t. 46.), is much more common, and appears to be what Linnæus intended by his *ſtellatum*.

G. *quadrifidum*, (Lycoperdon fornicatum; Hudſ. 644. Sowerb. Fung. t. 198.), has a ſingularly vaulted and elevated volva. It is found in Kent, Norfolk, and Yorkſhire.

G. *rufeſcens*, figured in Schmidel, t. 43, and in Schæffer's Fungi, t. 182, has a ſeſſile head. This is found in Germany and England. We believe Bolton's t. 179, belongs rather to the *coronatum*. See Persoon.

GEAUNE, in *Geography*, a town of France, in the department of the Landes, and chief place of a canton in the diſtrict of St. Sever; 12 miles S.E. of St. Sever. The place contains 788, and the canton 7479 inhabitants, on a territory of 167½ kiliometres, in 19 communes.

GEBA, a town and country of Africa, on a river of the ſame name, which joins the river St. Domingo. N. lat. 11° 55'. W. long 14°. The river *Geba*, or *Geſves*, which is one of thoſe that forms the delta of the Biſſagos, has a very ſteep deſcent, and is ſubject to a tremendous *bore*, or influx of the tide, which aſcends in three hours or leſs, while the decline is of ſix hours. This phenomenon is known in ſeveral other rivers, as the Ganges, Maranon, Severn, and at Libourne near Bourdeaux. See Bore.

GEBAL, in *Ancient Geography*, a town of Phœnicia, the ſame with Byblos and Gabala. Ptol.

GEBALA, a town of Hiſpania Tarragonenſis, in the country of the Varduli. Ptol.

GEBALITÆ, a people of Arabia Felix, diſtinguiſhed by Pliny from the *Catabani*, though probably connected with, or ſubordinate to, one another; for Tanna, or Thomna, the capital of the one, was alſo the capital of the other. Strabo places them near the entrance of the Arabic gulf: but Ptolemy fixes their ſituation at the mouth of the Perſic gulf.

GEBAU, in *Geography*, a town of Bohemia, in the circle of Boleſlaw; ſix miles S. of Benatek.

Gebau, *New*, a town and caſtle of Sileſia, in the principality of Oppeln; 10 miles S.E. of Falkenburg.

GEBBAR, a town of Aſiatic Turkey, in the province of Diarbekir; 10 miles S.E. of Jadida.

GEBBATHON, or Gibbethon, in *Ancient Geography*, probably the ſame with *Gabbatha*, a Levitical city in the tribe of Dan, on the frontiers of Judah; 12 miles from Eleutheropolis, where was ſhewn the tomb of the prophet Habbakuk.

GEBEL, or Gebal, ſignifying a mountain, gives denomination, with appropriate additions, to ſeveral mountains in Arabia, Egypt, and Abyſſinia: ſuch as, G. *Camar*, a mountain of Arabia, extending N.E. from Fartach:—G. *Docan*, a mountain of Egypt, 100 miles S. of Suez:—G. *Ezzeit*, a mountain of Egypt, near the coaſt of the Red ſea; 110 miles S.S E. of Suez:—G. *Geranat*, a mountain of Arabia, on the right bank of the Nile; 28 miles N. of Enſeneh:—G. *Farah*, a mountain of Arabia; 15 miles S.W. of Ailah:—G. *Ibn Jakub*, a mountain of Arabia; 65 miles S.S.E. of Hali:—G. *Naklan*, a mountain of Egypt; 8 miles S.W. of Fayoum:—G. *Ollak*, a mountain of Abyſſinia, rich in gold; N. lat. 20° 50':—G. *El Silſili*, or the Chained mountain, a mountain of Egypt, on the E. ſide of the Nile, ſo called, becauſe in ancient times a chain was thrown acroſs the river; 42 miles N. of Syené:—G. *Sinan*, a mountain of the Arabian Irak; 25 miles N.W. of Baſſora:—G. *Tar*, a volcanic iſland in the Red ſea, anciently called *Combuſta*. N. lat. 15° 18'. E. long. 59° 19':—G. *Teileman*, a mountain of Egypt, on the W. ſide of the Nile; 12 miles N.N.W. of Syené:—G. *Teir*, or mountain of birds, a mountain of Egypt, on the E. bank of the Nile, named from a fabulous tradition that all the birds of the univerſe hold a council here annually; 24 miles N. of Enſeneh:—G. *Zaghir*, an iſland in the Red ſea. N. lat. 14°. E. long. 60° 28'.

Gebel-*Aroc*, a cluſter of ſmall iſlands in the Red ſea. N. lat. 13° 36'.

GEBER, in *Biography*, commonly called the *Arabian*, was a Greek by nation, according to Leo Africanus, who adds that he abandoned Chriſtianity and became a Mahometan. Other writers aſſert that Geber was born at Seville, in Spain, but that he was of Arabian origin; it is even affirmed that he was grandſon of Mahomet by his mother's ſide. There is equal difference of opinion as to the age in which he lived: according to Blancanus, he floriſhed in the ninth century; according to others in the eighth, and even in the ſeventh. This laſt period is moſt generally ſuppoſed to be the true one.

That Geber was a man of extenſive attainments, the catalogue of his writings, given in the Bibliotheca of Geſner, ſufficiently evinces. He was learned in chemiſtry, and is conſidered as having been one of the firſt reformers in that art. Paracelſus, who ſeldom beſtowed praiſe, called him the maſter of maſters in the art; and Boerhaave ſpeaks of him, in his Inſtitutes of Chemiſtry, with great reſpect. His works, indeed, contain much curious matter relative to the nature, purification, fuſion and malleability of the metals, with excellent hiſtories of the ſalts and acids: and the accuracy of many of his operations is ſurpriſing. He was addicted, however, to all the reveries and vain purſuits of the alchemiſts, and condeſcended occaſionally to uſe the myſtical jargon of the tribe. Dr. Johnſon is diſpoſed to derive the word *gibberiſh*, which he ſays was anciently written *gebriſh*, and probably ſignified the jargon of the alchemiſts, from Geber. The works of this author were publiſhed in Engliſh at Leyden by Richard Ruſſell, in 1668.—Eloy. Dict. Hiſt.

GEBESEE, in *Geography*, a town of Germany, in Thuringia; 8 miles N.N.W. of Erfurt. N. lat. 51° 10'. E. long. 10° 59'.

GEBIZEH, a town of Aſiatic Turkey, in Natolia, ſuppoſed to be the ancient Libyſſa, where Hannibal killed himſelf; 18 miles W. of Iſmid.

GEBRES. See Gaurs and Gentoos.

GEBROOKEN, one of the ſmaller Japaneſe iſlands, near the S. coaſt of Niphon. N. lat. 34° 36'. E. long. 139°.

GEBUL, a town of Syria; 20 miles S.E. of Aleppo.

GEBY, an iſland in the Eaſt Indian ſea, between Waygoo and Gilolo, about 15 miles long and 3 broad, on the equinoctial line. E. long. 129° 25'.

GECCO, or Gekko, in *Natural Hiſtory*, a name given by the Indians to their terrible poiſon, which kills in ever ſo ſmall quantity when mixed with the blood. They ſay that this gecco is a venomous froth or humour, vomited out of the mouths of their moſt poiſonous ſerpents, which they procure

procure in this fatal ſtrength, by hanging up the creatures by the tails, and whipping them to enrage them: they collect this in proper veſſels as it falls, and when they would uſe it, they either poiſon a weapon with it, or wounding any part of the fleſh, introduce the ſmalleſt quantity imaginable of it, and this is ſaid to be immediate death.

GECKO, in *Zoology*, a ſpecies of *Lacerta*, which diſcharges the poiſonous juice above-mentioned. See LACERTA *Gecko*.

GED, or GID, in *Ornithology*, an Engliſh name for the ſmall ſpecies of ſnipe, uſually called the *Jackſnipe*, or *Judcock*, and by authors *gallinago minima*. See SCOLOPAX *Gallinula*.

GEDAN, in *Geography*, a ſmall iſland in the Red ſea. N. lat. 16° 20′.

GEDAN, or *Ziden*, a town of Arabia; 30 miles S.S.E. of Jidda.

GEDDES, ALEXANDER, in *Biography*, was born at Arradowl, in the county of Banff, and in the pariſh of Ruthven, September 4, 1737, old ſtyle. His father's name was Alexander Geddes, the ſecond of four brothers. His mother's maiden name was Janet Mitchel; ſhe was born in Nether Dalachy, in the pariſh of Bellay. They were reſpectable, but not opulent farmers, ſuch as farmers are in that part of the country, ſubject to grievous oppreſſions from their landlords. In that ſtation, however, they maintained an excellent reputation, and laboured inceſſantly to give an education to their children, far above their rank. In their religious ſentiments they were liberal Roman Catholics, in whoſe library, we are told, the principal book was an Engliſh edition of the bible, which they taught their ſon to read with reverence and attention at a very early period. In his infancy, the principal facts contained in that book were familiar to his mind, and, before he had attained his eleventh year, he knew all its hiſtory by heart. He was afterwards ſent to Scalan, an obſcure place of education in the Highlands, at which thoſe young perſons were brought up, who had been devoted to the prieſthood, and who were deſtined to finiſh their ſtudies at a foreign univerſity. At this ſeminary, we have reaſon to believe, young Geddes laid the foundation of that ſuperior ſkill in the learned languages, for which he was afterwards ſo eminently diſtinguiſhed. In October 1758, he was ſent from Scalan, to the Scotch college in Paris, where he arrived about the end of December, after having narrowly eſcaped ſhipwreck in his paſſage from Aberdeen to Camphire. Mr. Gordon was then principal of the college. In a few days after his arrival, he began to attend the lectures, and entered immediately into rhetoric. He ſoon got at the head of the claſs; although there were two veterans in it. Vicaire was then profeſſor, and contracted a friendſhip for him, which laſted all his life. At the beginning of the next ſchool-year, he ſhould have entered into a courſe of philoſophy; but was perſuaded to ſtudy philoſophy at home at intervals, and to enter in divinity. He attended the lectures of M. M. Buré and De Saurent at the college of Navarre, and of Ladvocat, for the Hebrew, at the Sorbonne. Ladvocat was particularly attentive to him, and wiſhed much to have him remain at Paris; but other counſels prevailed; and he returned to Scotland in the year 1764. On his arrival at Edinburgh he was ſent to Dundee, to officiate as prieſt to the Catholics in the county of Angus. But he did not remain long in that ſtation; being removed in May 1765, to Traquaire, where he reſided nearly three years as domeſtic chaplain to the earl of Traquaire. Of this connection he was accuſtomed to ſpeak with ſatisfaction and gratitude, as having afforded him much leiſure for literary purſuits, and the uſe of a well-furniſhed library, admirably adapted to aſſiſt him in his favourite ſtudies. He left Traquaire in the autumn of 1768; and after a few weeks ſtay in Angus, returned to Paris, where he remained the following winter; during which he was moſtly in the king's and other libraries, and made ſeveral extracts from rare books, particularly Hebrew ones. In the ſpring of 1769, he returned to Britain, and undertook the charge of a conſiderable Roman Catholic congregation at Auchinhalrig, in Banffſhire. In the ſummer of 1770, he projected and built a new chapel on the ſame ſpot where the old one ſtood; and ſoon after made the old houſe at Auchinhalrig one of the moſt neat and convenient belonging to the Roman Catholic clergy in Scotland. This, and other unavoidable expences, encumbered him with debt; from which he was however relieved by the generoſity of the late duke of Norfolk. He then thought, that a little farm would help him to live more comfortably; but the conſequence was quite the reverſe; he was obliged to borrow money to ſtock it, and the failure of three ſucceſſive crops plunged him deeper in debt. In 1779, he left Auchinhalrig; after having continued during ten years in the aſſiduous diſcharge of the various duties belonging to his paſtoral office; and when he retired, it was with the moſt ſincere and unfeigned regret of all thoſe among whom he had miniſtered. The attention which he paid to the inſtruction of the young had never been ſurpaſſed, and but rarely equalled, by any of his predeceſſors.

His great learning, which began now to be univerſally known among the literati of the north, obtained for him, in the year 1780, a diploma, creating him doctor of laws, from the univerſity of Aberdeen. This was an honour that had never ſince the reformation been conferred by that body on a Roman Catholic. About this period Dr. Geddes came to London, and officiated for a few months as prieſt in the Imperial Ambaſſador's chapel, till it was ſuppreſſed at the end of the year 1780, by an order from the emperor Joſeph II. Dr. Geddes afterwards preached occaſionally at the chapel in Duke-ſtreet, Lincoln's-inn-Fields, till Eaſter 1782, when it is believed he totally declined the exerciſe of all clerical functions. It was at a much earlier period than this, that he formed a deſign of giving a new tranſlation of the whole bible. About the year 1760, he began to read with this view: he was then acquainted with only two verſions of that book, the vulgar Latin, and the vulgar Engliſh; in favour of the latter he had been much prepoſſeſſed in the early part of his life; but when he had acquired a knowledge of the Latin language, ſufficient to enable him to compare the two tranſlations, he gave a decided preference to the Vulgate. The Engliſh appeared to him rugged, conſtrained, and often obſcure, where the Latin was ſmooth, eaſy, and intelligible.

In the year 1762, he began to read the originals, with theſe verſions conſtantly before him, when he quickly diſcovered that the great object of the Engliſh tranſlators had been to give a ſtrictly literal verſion, at the expence of almoſt every other conſideration; while the author of the Vulgate had endeavoured to render the original equivalently, into ſuch language as was current in his age. Struck with the advantages of the latter method, Dr. Geddes immediately reſolved to follow the ſame plan if he ſhould ever tranſlate the bible. His original ideas, in this reſpect, though frequently reviewed by him, underwent but few alterations. The unwearied attention which he paid to the ancient verſions in the Polyglott confirmed him in the opinion, that a ſtrictly literal verſion was not the moſt proper to convey its meaning, and diſplay its beauties, ſince even thoſe tranſlators, who had the text to render, not into a different language, but only into different dialects of the ſame language, had not

attempted

attempted a ſtrictly literal verſion, and that thoſe of them who were the leaſt literal, had the moſt forcibly and intelligibly rendered their text. That Dr. Geddes ſhould have had, among the members of his own church, an hoſt of oppoſers, will not afford matter of aſtoniſhment to any one: he ſeems to have anticipated obloquy from the rich and the low vulgar, as the principal reward of an almoſt more than Herculean labour. But he was contented to go through evil as well as good report. He knew he had not a "mercenary ſoul;" the public knows, and poſterity will confeſs, that he poſſeſſed one expanded with the beſt principles of liberality and diſintereſtedneſs. "I expect not," ſays he, "exceſſive profits from exceſſive exertions. I truſt I ſhall never want meat, and clothes, and fire; to a philoſophic and contented mind, what more is neceſſary?"

It appears that Dr. Geddes had been engaged ſeveral years in this great undertaking before he ſaw any proſpect of meeting with encouragement ſufficient to make it public, if it were completed, and ready for the preſs. He had, in addition to difficulties common to ſituations of this kind, to contend with others peculiar to himſelf. He had a mind ardently intenſe in the purſuit and inveſtigation of truth. He could not brook error in any perſon, however exalted, nor would he hear it advanced and maintained, without ſhewing the indignation of a high and noble ſpirit. The ſentiment contained in the preface to his letter, addreſſed to the Engliſh Catholics, was one of the leading maxims by which his life was governed. "At any rate, I do what I think it my duty to do, and do it fairly and openly. In the following pages, ye will find neither palliation nor diſguiſe. I pour out my ſentiments with the ſame ſincerity as if I were before the tribunal of Him who is to judge the living and the dead. Miſtake I may, but prevaricate I never will." Such a ſpirit ſhewn in almoſt every act of his life, and in all the ſocial intercourſes and connections with the world, though meriting the applauſe of every honourable mind, was not the moſt likely to conciliate the regards of thoſe who might have afforded him real and effectual aſſiſtance. After he had ſpent much of his valuable life in biblical ſtudies, he complains of having met with a long and cruel interruption to them, and ſays, "I had but little hopes of ever being in a ſituation to reſume them, when Providence threw me into the arms of ſuch a patron as Origen himſelf might have been proud to boaſt of, a patron, who, for theſe ten years paſt, has, with a dignity peculiar to himſelf, afforded me every conveniency that my heart could deſire towards the carrying on and completing of my arduous work." The public are not now to be told that this liberal patron, of high and diſtinguiſhed worth, and of biblical literature, was the late excellent lord Petre.

In the year 1786, Dr. Geddes publiſhed his "Proſpectus of a new Tranſlation of the Bible," which excited very conſiderable attention; and in 1788 he publiſhed "Propoſals for Printing by Subſcription a New Tranſlation of the Bible, &c." but it was not till the ſpring of the year 1792, that the firſt volume of this work made its appearance. The volume contained the firſt ſix books of the Old Teſtament, and was dedicated to his excellent patron lord Petre. Soon after the publication, three vicars apoſtolic, who ſtyled themſelves the biſhops of Rama, Acanthos, and Centuriæ, iſſued a paſtoral letter, addreſſed to their reſpective flocks, warning them againſt the reception of Dr. Geddes's verſion. This unwarrantable ſtretch of eccleſiaſtical power occaſioned a correſpondence between Dr. Geddes and the biſhop of Centuriæ, in the courſe of which, the prelate, probably feeling his own impotence in argument, availed himſelf of the little brief authority of office, and declared the doctor ſuſpended from the exerciſe of his eccleſiaſtical functions unleſs he would ſignify his ſubmiſſion to an injunction contained in the paſtoral letter. The worthy doctor was not to be intimidated: no dread of perſonal inconvenience could arreſt him in his progreſs. His reply was conceived in highly animated terms, and admirably adapted to the circumſtances of the caſe. And in a ſtill longer letter to the biſhop of Centuriæ, he ſays, "I truſt ye will not deem it preſumption in me to grapple with biſhops; indeed, I would boldly grapple with popes, if popes dared to injure me. Our Catholic anceſtors frequently grappled with them, and ſometimes came off victorious. A pope, and conſequently a biſhop, may do wrong, and if he do wrong, may be told of it even by an inferior." In the year 1797, the ſecond volume of the Tranſlation was given to the world. In the preface to this volume, the author controverts and indeed gives up the popular doctrine of the abſolute and plenary inſpiration of the Scriptures: he conſiders the Hebrew hiſtorians to have written, like all other hiſtorians, from ſuch human documents as they could find; conſequently, like them, liable to miſtakes. The doctor alſo gave up as fabulous, and totally unworthy of the divine goodneſs, ſuch commands and injunctions, as appeared to his mind to be unworthy even of human authority; and in this view of the ſubject he denied, without heſitation, that the command given to deſtroy the Canaanites could be of divine origin.

In his volume of "Critical Remarks," publiſhed in 1800, he entered into a full vindication of this theory. If the mention of obnoxious opinions created him an hoſt of opponents, a juſtification of them was not likely to abate their fury, nor very much diminiſh their number. As he wrote to pleaſe no party, he had enemies in every party, and indeed to a perſon who thought and wrote ſo freely, this will not be unexpected. Dr. Prieſtley even, who had himſelf been a thouſand times calumniated as an unbeliever, ſeemed to doubt if ſuch a man as Geddes, who believed ſo little, and who conceded ſo much, could be a Chriſtian. To doubts of every deſcription, and to all his various opponents, the doctor replied, in a work entitled "A General Anſwer to the Queries, &c." He had before this given a tolerably explicit avowal of his creed. "The goſpel of Jeſus is my religious code: his doctrines are my deareſt delight: his yoke is eaſy, and his burthen light; but this yoke I would not put on; theſe doctrines I could not admire; that goſpel I would not make my law, if reaſon, pure reaſon, were not my prompter and preceptreſs. I willingly profeſs myſelf a ſincere, though unworthy diſciple of Chriſt: Chriſtian is my name, and Catholic my ſurname. Rather than renounce theſe glorious titles, I would ſhed my blood, but I would not ſhed a drop of it for what is neither Catholic nor Chriſtian."

Beſides the tranſlation of the early books of the Bible, the Critical Remarks, and thoſe other works to which we have already referred, we ſhould notice, as highly deſerving the attention of the biblical ſcholar, a letter to the biſhop of London, 1787. In 1793, he wrote an addreſs to the public on the publication of his new tranſlation: and in the ſucceeding year, his letter to, and correſpondence with, the biſhop of Centuriæ, were publiſhed. As a controverſialiſt, Dr. Geddes diſtinguiſhed himſelf in the year 1787, by a letter to Dr. Prieſtley, in defence of the divinity of Jeſus Chriſt; and by a letter to a member of parliament, on the expediency of a general repeal of all penal ſtatutes that regard religious opinions. In a modeſt apology for the Roman Catholics of Great Britain, publiſhed in the ſpring of 1800, Dr. Geddes has diſplayed much zeal in defence of the tenets to which he adhered; great moderation when deſcanting upon the injuries to which himſelf and brethren

were

were ſubject, by the continuance of perſecuting laws; and found reaſoning when he argues in behalf of the juſtice and policy of aboliſhing all legal diſabilities for conſcience ſake. This work deſerves the attentive peruſal of the liberal and candid of every ſect. The author has taken large and comprehenſive views of his ſubject; and has, in the diſcuſſion of it, diſplayed great ingenuity and acuteneſs—very extenſive reading—great variety and depth of learning—uncommon vigour of thought and energy of diction. He was author of many lighter pieces, poetical and proſe. In purſuing his great work Dr. Geddes intended next to have preſented the world with a new tranſlation of the book of Pſalms; but during the laſt year of his life, his literary purſuits were greatly interrupted by a long ſeries of painful affliction, yet in every interval of eaſe he applied himſelf to a work in which his heart was engaged. He had already printed one hundred and four of the Pſalms, and had prepared completely for the preſs as far as the 118th, when he was arreſted by a moſt painful and excruciating diſorder, which terminated his valuable and important life on the 26th of February 1802. The tranſlation of the book of Pſalms was publiſhed in 1807, as a poſthumous work, by his highly valued friends the Rev. Dr. Diſney, and Charles Butler, eſq.

Dr. Geddes's diſpoſition was truly philanthropic and benevolent, and his wit and vivacity contributed greatly to the delight of the ſocial parties in which he mixed. He was a ſtrenuous and uniform advocate for uncontrolled freedom of opinion, and freedom of diſcuſſion: he was, in the ſtricteſt ſenſe of the word, a genuine Catholic, extending his good will to all of every ſect and party, and diſpoſed to grant to others every privilege which he claimed for himſelf. Monthly Magazine, 1802. New Annual Register. Good's Life of Geddes.

Geddes, James, a learned Scotch writer, deſcended from a reſpectable family in the county of Tweedale, was born about the year 1710. In early life, he made a rapid progreſs in the learned languages, and in the elements of philoſophy, and ſoon entered with ſpirit into the ſentiments, and felt the beauties of the ancient writers. Having gone through his elementary courſe at ſchool, he was transferred to the univerſity of Edinburgh, where he made conſiderable proficiency in mathematics and natural philoſophy, under the tuition of the celebrated Maclaurin. His attention at a proper period was directed to the law, and he was admitted an advocate. For ſeveral years he practiſed at the bar with a high and uniformly increaſing reputation, and afforded flattering hopes of riſing to eminence in his profeſſion, but he died of a decline while he was young. His private character was amiable, and his loſs was ſincerely lamented by all who knew him. He retained through life that reliſh for ancient literature which he had imbibed in his youth, and devoted what time he could ſpare from the duties of his buſineſs, and the affairs of his family, to the ſtudy of the ancient poets, philoſophers, and hiſtorians. He was author of "An Eſſay on the compoſition and manner of writing of the Ancients, particularly Plato." This was publiſhed after his death, and it was once intended to print ſome of the other papers which he left behind him.

Geddes, Michael, a learned divine who flouriſhed in the ſeventeenth and eighteenth centuries. The time and place of his birth are not known, nor is it aſcertained where he was educated. He is firſt noticed in the capacity of chaplain to the Engliſh factory in that city, the duties of which he diſcharged for nearly ten years But during that time, *viz.* in the year 1686, he was ſummoned to appear before the court of Inquiſition. On his entrance before the judges they received him with an affectation of civility, and deſired him to be ſeated, but almoſt before he could accept of their offer they ſternly demanded how he dared to preach, or to perform any of the duties of his office in that city. Geddes, knowing upon what ground he ſtood, was not to be intimidated, he boldly replied that he enjoyed that liberty by virtue of an article in the treaty between the crowns of Portugal and England; that it was a privilege which had never been called in queſtion, and that he had reſided at Liſbon eight years, during which time he had ſerved the Engliſh factory in the capacity of chaplain, as others had done before him. To theſe declarations they replied, in defiance of all truth and modeſty, that they had been ignorant that ſuch liberty had been aſſumed by him and others, or that it ſhould not have been allowed. They then ſtrictly enjoined him to miniſter no more to his congregation. Letters of complaint were addreſſed by the factory to the biſhop of London, but before their arrival the prelate was ſuſpended, and no hopes of redreſs could be expected from the arbitrary and tyrannical James, by whom and his courtiers the Portugueſe were probably excited to this ſtep. In this ſtate of affairs, Mr. Geddes, finding himſelf no longer of uſe to the Engliſh reſidents, thought it adviſable to return to his native country, which he did in 1688. In a ſhort time after this he was created doctor of laws, and made chancellor of the dioceſe of Sarum. He died about the year 1714, leaving behind him ſeveral valuable works. Among theſe were "The hiſtory of the church of Malabar, from the time of its being diſcovered by the Portugueſe, in the year 1501, and of the Synod of Diamper, celebrated in the year 1599." "The church hiſtory of Ethiopia, including an account of the two great Roman Miſſions into that empire." "The Council of Trent, no free Aſſembly &c. &c." Alſo three volumes of "Miſcellaneous Tracts," relating to ſubjects in civil and eccleſiaſtical hiſtory; ſeveral Tracts againſt Popery, and the life of "Don Alvaro de Luna." Biſhop Burnet, who was his acquaintance and friend, ſays "he was a learned and wiſe man. He had imbibed a true notion of popery, as he had found it eſtabliſhed in Portugal, and as it was known in this country during the reigns of the Stuarts, as a political combination, managed by falſehood and cruelty to eſtabliſh a temporal empire in the perſons of the popes." Burnet's Hiſt. of Reformation.

GEDDINGTON, in *Geography*, a pariſh in the hundred of Corby, Northamptonſhire, England, has been formerly a place of note; as king Henry II. held a parliament here in 1188, to raiſe money for a cruſade. Nearly in the centre of the village is a ſtone croſs, which king Edward I. raiſed to perpetuate the memory of his queen, Eleanor. This croſs conſiſts of a triangular ſhaft, raiſed on ſteps, and is decorated with various ornaments and ſtatues in niches. A plan, view, and details of it are publiſhed in "the Architectural Antiquities of Great Britain," wherein its hiſtory is narrated, with accounts of other croſſes erected on the ſame occaſion. See vol. X. of this work, under the word Cross. This village conſiſts of 152 houſes, which are occupied by 663 inhabitants. Beauties of England and Wales, vol. xi.

GEDER, and Gederoth, in *Ancient Geography*. See Gadara.

Geder, in *Geography*, a town of Aſiatic Turkey, in the government of Sives; 15 miles S.W. of Amaſieh. See Amasieh.

GEDERN, or Geudern, a town of Germany, in the county of Konigſtein; 25 miles S.E. of Gieſſen.

GEDIDE, a town of the Arabian Irak, on the Euphrates; 16 miles S.E. of Bagdad.

GEDIN-

GEDINGOOMA, a town of Africa, in Kaarta; 30 miles N.W. of Kemmoo.

GEDINNE, a town of France, in the department of the Sambre and Meuſe, and chief place of a canton in the diſtrict of St. Hubert. The place contains 270, and the canton 6340 inhabitants, on a territory of 347½ kiliometres, in 32 communes.

GEDOYN, Nicholas, in *Biography*, a French abbè, was born at Orleans in 1667. He was educated at the Jeſuits' college in Paris, and afterwards entered their ſociety, in which he remained ten years. He then quitted it, and appeared in the world as a man of gallantry and letters, and a wit. He was intimate with the celebrated Ninon de l'Enclos, but his way of life did not injure his fortune, for he was preſented with ſeveral inſtances of church preferment. He was, on account of his great literary reputation, admitted a member of the Academy of Belles Lettres, and alſo of the French academy. He died in 1744, leaving behind him the character of a man of ſtrict integrity, of great urbanity and candour. He was a great admirer of antiquity, and held all attempts in poetry and eloquence as vaſtly inferior to the maſter-pieces of the ancients. He publiſhed "Œuvres Diverſes" a collection of diſſertations on moral and literary topics: and he was the tranſlator of Quintilian and Pauſanias: his verſion of the firſt is accounted one of the moſt elegant performances of the kind; and his tranſlation of Pauſanias is alſo elegant, and is enriched with learned notes. Moreri.

GEDROSIA, in *Ancient Geography*, an extenſive province of Aſia, bounded on the W. by Carmania, on the N. by Drangiana and Arachoſia, on the E. by Guzerat, a province of India, and on the S. by the Indian ocean. It is now called *Makran*; which ſee. Its chief river was the Arbis; and its principal cities were Poſis, Arbis, and Cuni. It was anciently inhabited by the Arbitæ, Parſiræ, Maſarnæi, and the Rhamnæ; and was divided into eight provinces or ſatrapies, containing twelve conſiderable towns. Marcian of Heraclea and Ptolemy place in this county a famous emporium, called γυναικων λιμην, or the "Haven of Women."

GEDUMAH, in *Geography*, a country of Africa, on the eaſt ſide of the river Senegal, governed by a king, who is a Mahometan; bounded on the N. by Sahara, or the Great Deſert, on the E. by Jaffnoo, on the S. by Jaaga, and on the W. by Foota-Torra; of a ſquare form, about 60 miles each way. N. lat. 14° 50′ to 16°. W. long. 9° 40′ to 11° 20′.

GEDWABENEN, a town of Pruſſia, in the province of Oberland; 6 miles N.W. of Paſſenheim.

GEEL, John Van, in *Biography*, an hiſtorical painter of the Dutch ſchool:—one of thoſe imitators of Metzu, whoſe works ſerve not to aid the credit of the maſter, but more to puzzle the connoiſſeur and aſſiſt the picture-dealer in his nefarious practices of impoſition upon thoſe amateurs of painting whoſe zeal ſurpaſſes their knowledge. The arrangement of his pictures, and his colour and character of ſubjects, are the ſame with thoſe of Metzu; and his works are therefore conſtantly miſtaken for thoſe of that painter.

GEELE, or Gheele, or *Gele*, in *Geography*, a town of Brabant; 10 miles N.W. of Dieſt.

GEEMSKERSKOI Nos, a cape on the eaſt coaſt of Nova Zembla. N. lat. 77° 10′. E. long. 77° 14′.

GEEONG, a town of the iſland of Borneo. N. lat. 5° 10′. E. long. 117° 10′.

GEER, Charles de, in *Biography*, a celebrated naturaliſt, deſcended from an ancient noble Dutch family, eſtabliſhed in Sweden, in the time of Guſtavus Adolphus, an individual of which, introduced into that country various improvements in the manufactures and mechanical arts, particularly in the method of caſting and working in braſs, and on that account was ennobled. The ſubject of this article was born in 1720, and in his fourth year accompanied his parents to Holland, from which he returned to Sweden at the age of eighteen. At this period he had made very conſiderable progreſs in his ſtudies in natural hiſtory under Linnæus and other celebrated profeſſors; and by the death of his uncle he came into poſſeſſion of a conſiderable ſhare in the iron works of Dannemora, and it being then very difficult and expenſive to keep them free of water, he did a great and moſt important ſervice to theſe mines by the activity with which he promoted the improvements made in the machinery. By his other inventions he obtained conſiderable property, but the riches which he acquired by his genius and induſtry, he privately ſhared with the poor, and built or repaired churches, and eſtabliſhed various ſchools. His leiſure time he devoted to the ſtudy of the minuter parts of creation, which, by the help of glaſſes, he carried to a great degree of perfection. In the year 1761 he was appointed marſhal of the court, and knight of the Polar ſtar, and in 1772 he was made commander of the order of Vaſa, with the grand croſs, and in a few months he was raiſed to the dignity of baron. He died in March 1778, having at that time the laſt volume of his work upon inſects in the preſs. De Geer had cauſed his obſervations on this ſubject to be inſerted in the Tranſactions of the Learned Societies; but as they increaſed, he reſolved to publiſh them in ſeparate volumes, the firſt of which appeared in the year 1752 under the title of "Memoires pour ſervir à l'hiſtoire des Inſectes." Nineteen years afterwards the ſecond volume appeared, and in 1779 the ſeventh and laſt was publiſhed. On account of his extenſive knowledge of entomology he was called the Swediſh Reaumur. He was author of "An Oration on the procreation of Inſects," and alſo of many papers in the tranſactions of the academies of Stockholm and Upſal. Gen. Biog.

Geer, in *Mining*, ſignifies the feagh or refuſe ſpar and other matters from a mineral vein.

Geer-*barrel*, is the tub or barrel in which the ſpar or ore is drawn up the ſhaft from the mine, and diſcharged on the hillock.

GEERABAR, in *Geography*, a town of Bengal; 8 miles N.W. of Koonda.

GEERAR, a town of Hindooſtan, in Oude; 21 miles N.E. of Notchegong.

GEERING, in *Rural Economy*, a term applied provincially to the ladders and ſide-rails of a waggon or large cart.

GEERS, a term ſignifying the harneſs or trappings of draught or team-horſes.

Geers, in *Mining*, are two pieces of wood ſet up like a St. Andrew's croſs, or ×, at each ſide of a mine-ſhaft, and connected together by other pieces, for ſupporting the turn-tree or roll on which the rope winds for drawing up the geer-barrel and ore, or for winding water, and for drawing up and letting down the miners in ſome inſtances. See Stowse and Turn-tree.

Geers, in a *Ship*. See Jeers.

GEERVLIET, in *Geography*, a town of Holland, in the iſland of Putten; 5 miles from the Brill.

GEESE, a well known ſort of bird. See Goose.

GEESEH, in *Geography*, a village of Abyſſinia, near the ſource of the Nile. N. lat. 10° 59′. E. long. 86° 56′.

GEESTE, a river of Bremen, which fills the ditches of Cailſburg, and runs a little below into the Weſer.

GEETE,

GEETE, a river of Brabant, which runs into the Demer at Helen.

GEEVACH, mountains of Ireland, in the counties of Leitrim and Roſcommon, which contain ſeveral coal-mines; amongſt others thoſe which have been worked at Arigna.

GEFLE, a river of Sweden, which paſſes by the town of the ſame name, and runs into the gulf of Bothnia, about 10 miles below it. Here it begins to be navigable for veſſels drawing 9 or 10 feet of water.

GEFLE, or *Giavle*, a town of Sweden, in the province of Geſtricia, on an arm of the gulf of Bothnia, which divides the town, and ſurrounds it; thus forming two iſlands. This town is ancient; the houſes are conſtructed partly of brick or ſtone, plaiſtered white, which have a neat appearance, and partly of wood. It is commercial, has a good harbour, and is the reſidence of many rich merchants; its principal exports are iron, pitch and tar, and planks; many of its inhabitants are fiſhermen; 60 miles N. of Upſal. N. lat. 60° 42'. E. long. 16° 57'.

GEFREES, a town of Germany, in the principality of Bayreuth; 12 miles N.N.E. of Bayreuth. N. lat. 50° 5'. E. long. 10° 50'.

GEFRORN. See BRENNER.

GEGADIVAY, a town of Hindooſtan, in the Myſore; 8 miles S.E. of Kiſtnagheri.

GEGE, a river of Pruſſian Lithuania, which runs into the Wilde; 2 miles S.E. of Plaſchken.—Alſo, a town of Hindooſtan, in Cochin; 25 miles E. of Cochin.

GEGENDA, a town of European Turkey, in Bulgaria, on the Danube; 20 miles W. of Nicopoli.

GEGENES, Γεγενεις, in *Antiquity*. The ancients generally called themſelves Γεγενεις, *ſons of the earth*, as Heſychius informs us. Alluding to the ſame original, the Athenians ſometimes ſtyled themſelves Τεττιγες, *graſshoppers*; and ſome of them wore graſshoppers of gold faſtened to their hair, as badges of honour, to diſtinguiſh them from others of leſs antiquity, and leſs noble extraction, becauſe thoſe inſects were believed to be generated out of the ground. Pott. Archæol. Græc. lib. 1. cap. 1.

GEGENY, in *Geography*, a town of Hungary; 23 miles E. of Gros Wardein.

GEGLACKE, a town of Pruſſia, in Natangen; 10 miles N.E. of Raſtenburg.

GEGNO, a town of Italy, in the department of the Lario; 3 miles N. of Como.

GEHANPENNA, a town of Hindooſtan; 7 miles N.W. of Delhi.

GEHARCONDA, a town of Hindooſtan, in Candeiſh, on the river Oodah Ootale; 50 miles E. of Burhanpour.

GEHENNA, Γεεννα, a ſcripture term, which has given ſome perplexity to the critics. It occurs in St. Matthew, v. 22. 29, 30. x. 28. xviii. 9. xxiii. 15. 33. Mark, ix. 43. 45. 47. Luke, xii. 5. James, iii. 6.

The authors of the Louvain and Geneva verſions retain the word *gehenna*, as it ſtands in the Greek; the like do M. Simon and the Latin tranſlators; but the Engliſh tranſlators render it by *hell* and *hell-fire*; and the like do the tranſlators of Mons, and father Bohours: but it is indiſputable, that it is employed in the New Teſtament to denote the place of future puniſhment; whereas in the Old Teſtament we do not find this place mentioned in the ſame manner. Accordingly, the word γεεννα does not occur in the Septuagint; and as it is not a Greek word, it is not to be found in the Greek claſſics. It is originally a compound of the two Hebrew words גיא הנם; *ge hinnom*, the valley of Hinnom, a place near Jeruſalem, firſt mentioned in the book of Joſhua, (ch. xv. 8.) It was there that the cruel ſacrifices of children were made, by cauſing them to paſs through fire, to Moloch, the Ammonitiſh idol (2 Chron. xxxiii. 6.) It was alſo called "Tophet," (2 Kings, xxiii. 10.), as it is ſuppoſed, from the noiſe of drums (Toph ſignifying a drum), a noiſe produced on purpoſe to drown the cries of the helpleſs infants. King Joſiah, to render this place for ever abominable, made a cloaca, or common ſewer thereof, where all the filth and carcaſes in the city were caſt.

The Jews obſerve farther, that there was a continual fire kept up there, to burn and conſume thoſe carcaſes; for which reaſon, as they had no proper term in their language to ſignify *hell*, they made uſe of that of *gehenna*, or *gehinnom*, to denote a fire inextinguiſhable.

As this place was, in proceſs of time, conſidered as an emblem of hell, or the place of torment reſerved for the puniſhment of the wicked in a future ſtate, the name "Tophet" came gradually to be uſed in this ſenſe, and at length to be confined to it. This is the ſenſe, as Dr. Campbell (Prel. Diſſ. to the Four Goſpels) conceives, in which gehenna, a ſynonymous term, is always to be underſtood in the New Teſtament, where it occurs twelve times. In ten of theſe there can be no doubt; in the other two the expreſſion is figurative; but the figure is taken, without queſtion, from that ſtate of miſery which awaits the impenitent. Thus, the Phariſees are ſaid to make the proſelyte, whom they compaſs ſea and land to gain, two-fold more a child of hell, υιος γεεννης, than themſelves (Matt. xxiii. 15); an expreſſion both ſimilar in form, and equivalent in ſignification to υιος Διαβολου, ſon of the devil, and υιος της απολειας, ſon of perdition. In the other paſſage (James, iii. 6.) an unruly tongue is ſaid to be ſet on fire of hell, φλογιζομενη υπο της γεεννης.

GEHMEN, in *Geography*, a town of Germany, and capital of a lordſhip in the circle of Weſtphalia, ſituated on the Aa, within the biſhopric of Munſter. The inhabitants are Lutherans and Calviniſts, each of whom have a church; 16 miles N.E. of Weſel. N. lat. 51° 55'. E. long. 6° 45'.

GE-HO, a town of Chineſe Tartary; 100 miles N.E. of Pekin. N. lat 41° 3'. E. long. 117° 32'.

GE-HOFEN, a town of Germany, in the county of Mansfeld.

GEHRDEN, a town of Germany, in the principality of Calenberg; 6 miles W.S.W. of Hanover.

GEHREN, a town of Germany, in the county of Schwartzburg; 10 miles S. of Arnſtadt.

GEIBENHEIM, a town of France, in the department of the Upper Rhine; 12 miles N E. of Beforte.

GEJER, MARTIN, in *Biography*, a learned German, was born at Leipſic in the year 1614, where he was regularly educated. He was created a doctor in divinity, profeſſor of Hebrew, miniſter of St. Thomas's, and afterwards preacher, confeſſor, and member of the eccleſiaſtical council of the elector of Saxony. He died at the age of ſixty-ſeven in the year 1681. He was author of Commentaries on the books of Pſalms, Proverbs, Eccleſiaſtes, and Daniel, and many other works abounding in erudition. Theſe were afterwards collected and printed in two vols. folio. Moreri.

GEIHOUN, in *Geography*, a river of Syria, which runs into the bay of Alexandretta. N. lat. 36° 40'.

GEIKIN, a river of Perſia, which ſeparates the province of Kerman from Mecran, and runs into the Indian ſea; 60 miles S.W. of cape Jaſques.

GEIL, a river which riſes in the county of Tyrol, paſſes through Upper Carinthia, and joins the Drave, near Villach.

GEILENKIRCHEN, a town of France, in the department of the Roer, and chief place of a canton, in the diſtrict of Aix-la-Chapelle. The place contains 431, and the canton 12,245 inhabitants, in 46 communes: 8 miles N.W. of Juliers. N. lat. 50° 57′. E. long. 6° 10′.

GEILGARBEN, a town of Pruſſia, in Samland; 15 miles N.E. of Konigſberg.

GEILSDORF, a town of Saxony, in the Vogtland; 5 miles S.S.W. of Plauen.

GEILSTATT, a town of Germany, in the biſhopric of Bamberg; 3 miles N. of Bamberg.

GEILZHEIM, a town of Germany, in the principality of Anſpach.

GEIRA, a town of Aſiatic Turkey, in Natolia, anciently *Aphrodiſias*, a city of Caria; 60 miles E.S.E. of Guzelhiſar.

GEISEL, a river of Saxony, which runs into the Saale; 5 miles S. of Halle.

GEISELAND, a town of Germany, in the county of Schwarzenburg; 16 miles N. of Schainfeld.

GEISELWINDEN, a town of Germany, in the county of Schwarzenburg; 8 miles E. of Schainfeld.

GEISENFELD, a town of Bavaria; 9 miles S.E. of Ingolſtadt.

GEISENHEIM, a town of Germany, in the circle of the Lower Rhine; 17 miles W. of Mentz.

GEISING, a town of Saxony, in the margraviate of Meiſſen; 20 miles S. of Dreſden.

GEISINGEN, a town of Germany, in the principality of Furſtenberg; 14 miles N. of Schaffhauſen.

GEISLEDE, a river of Germany, which runs into the Leine, near Heiligenſtadt, in the territory of Eichsfeld.

GEISLINGEN, a town of Germany, in the circle of Swabia, on the Kocher, containing two churches; 12 miles W. of Ulm. N. lat. 48° 34′. E. long. 9° 50′.

GEISMAS, a town of Germany, in the principality of Heſſe; 22 miles W. of Gottingen. N. lat. 51° 20′. E. long. 9° 24′.

GEISON. See GISON.

GELSPOLCHEIM, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the diſtrict of Straſbourg; 6 miles S.S.W. of Straſbourg. The place contains 2086, and the canton 11,683 inhabitants, on a territory of 135 kiliometres, in 14 communes.

GEISSELBORING, a town of Bavaria; 9 miles S.W of Straubing.

GEISSERN, a town of the archbiſhopric of Salzburg; 32 miles S. of Salzburg.

GEISSING SEE, a lake of Carinthia; 12 miles N. of Feitkirchen.

GEISSORRHIZA, in *Botany*, from γεισσον, a *penthouſe*, and ῥιζα, a *root*, alluding to the imbricated ſcales which clothe that part. Gawler in Curt. Mag. v. 18. t. 672. Sim's and Konig's Annals of Botany, v. 1. 223. A genus formed by Mr. Gawler, (now Ker Bellenden), out of *Ixia*, from which, according to him, it differs in having inclined ſtamens. Examples of it, beſides the plate above quoted, are *Ixia Rochenſis*, Curt. Mag. t. 598; *ſecunda*, t. 597; and *exciſa*, t. 584.

GEISTOL, in *Geography*, a river of Stiria, which runs into the Kainach, near Moſkirchen.

GEITHAYN, or GEITHEN, a town of Saxony, in the circle of Leipzig; 20 miles S.S.E. of Leipzig. N. lat. 51° 2′. E. long. 12° 39′.

GEKELEMUEKPECHUENK, a town of America, belonging to the Delaware Indians, on a creek of the ſame name, a head-water of the Muſkingum. This was the northernmoſt Moravian ſettlement of Muſkingum river. It lies 12 miles N.E. by N. from Salem, and 78 N. weſterly from Pittſburg.

GEKKO, and GEKKONES. See LACERTA.

GELA, in *Ancient Geography*, a town of Sicily, ſituated on the ſouthern coaſt at a little diſtance from the ſea, near the river Gela. This city was built by Antiphemus of Rhodes and Entimus of Crete, 713 years before the Chriſtian era. The ruin is now called "Fiume di Terre Nuova."

GELÆOPACHIA, in *Natural Hiſtory*, the name of a claſs of mineral fluids, which are inflammable, and of ſomewhat thick texture, and opake. The word is derived from the Greek γη, the *earth*, ελαιον, *oil*, and παχυς, *thick*. The bodies of this claſs are the Barbadoes tar, oil of earth, and the common piſſaſphaltum of the ſhops; which ſee under their ſeveral heads.

GELÆOPSILA, the name of a claſs of foſſils. The word is derived from the Greek γη, *earth*, ελαιον, *oil*, and ψιλος, *thin*, and expreſſes a thin oily ſubſtance naturally found in the earth. Theſe are thin and pellucid inflammable liquid ſubſtances, commonly known by the name of liquid bitumens, but by that denomination confounded with the thicker and coarſer kinds. The only bodies of this claſs are thoſe commonly diſtinguiſhed by the names of naphtha and petroleum.

GELALEAN CALENDAR. See CALENDAR.

GELANDRI, in *Ancient Geography*, a town ſituated on the bank and to the right of the river Danapris (the Dnieper), near the fourth cataract of this river.

GELASANI DENTES, a term uſed by ſome authors to expreſs the four middle fore-teeth, both of the upper and under jaw. They have their name from the Greek, γελος, *laughter*, becauſe they are ſhewn when people laugh.

GELASIUS I., in *Biography*, an African by birth, was admitted to the papal dignity in the year 492, on the death of Felix III., to whom he had been ſecretary. He was, almoſt immediately after his inſtallation, engaged in a diſpute with Euphemius, patriarch of Conſtantinople, reſpecting the name of Acacius being eraſed from the ſacred diptychs, or regiſters. Euphemius contended that the people and clergy would not and ought not to ſubmit to ſuch an indignity on the memory of their patriarch. To this repreſentation, Gelaſius replied in a moſt arrogant ſtyle, and declared his fixed reſolution not to be reconciled to the church of Conſtantinople while the name of Acacius was kept in the diptychs. This obſtinacy of the pope gave great uneaſineſs to the Catholic biſhops of the Eaſt, who were ſenſible of the advantage which the Eutychian party would derive from the continuance of the breach between them and Rome; and they applied to the ambaſſador, Fauſtus, who wrote to the pope, appriſing him of the fatal conſequences which they apprehended to their cauſe, if he ſhould perſiſt in his reſolution. The pope was, however, inflexible, till at length the eaſtern biſhops ſeparated themſelves from the communion of Rome, ſtruck out the name of Gelaſius from the diptychs, and unanimouſly reſolved neither to communicate with him, nor with any perſon who ſhould do ſo. Thus the pope loſt the moſt favourable opportunity of healing the ſchiſm which ſubſiſted between the eaſtern and weſtern churches. The breach was, indeed, during his pontificate, made much wider.

In 494, Gelaſius wrote letters to the biſhops of Dalmatia, and afterwards to thoſe of Dardania, juſtifying his own conduct in the buſineſs of Acacius; and urging them to oppoſe with vigour the Eutychians and Pelagians, and to treat them as enemies to the church, and rebels to St. Peter. In the year 495, he held a council of forty-ſix biſhops at Rome, at which was re-admitted to the communion of the church, and to his epiſcopal rank and ſee, Miſenus, biſhop of Cumæ, who had been depoſed and excommunicated under the pontificate of Felix III. for communicating with Acacius. Before, however, ſentence of abſolution was pronounced in favour of Miſenus, he was obliged ſolemnly to declare that he condemned, anathematized, and for ever execrated all who held communion with Acacius, or lived in communion with his ſucceſſors and abettors. During the papacy of Gelaſius, the Manichæan ſect began to revive at Rome, on which occaſion he iſſued a decree, by which all perſons who embraced their ſentiments were condemned to baniſhment, and their books burnt: and as it was cuſtomary with thoſe who were tinctured with their opinions to receive only the bread at the celebration of the Sacrament of the Lord's Supper, but to refuſe the wine, he condemned that practice in the ſtrongeſt terms, and ordered thoſe who refuſed the communion in both kinds, to be excluded from either, "becauſe," ſaid he "one and the ſame myſtery cannot be divided without ſacrilege." Gelaſius died in the year 496, having filled the high office of pope almoſt five years. He was author of many works, ſome of which were written avowedly in juſtification of his own conduct in ſuppreſſing hereſies, and in the abſolution of Miſenus. His moſt celebrated piece is "A Treatiſe againſt Eutyches and Neſtorius, concerning the two natures of Chriſt. As many of his other productions were inſerted in the "Collectio Conciliorum," ſo this was inſerted in the eighth volume of the Biblioth. Patrum. Gelaſius is thought to have been the author of the "Codex Sacramentarius," which is a collection of ſuch forms of public prayers and adminiſtrations of the ſacraments as were in uſe in the church of Rome in his time, digeſted in a new order, and including many additional forms of his own. The manuſcript of this codex was unnoticed for many ages, till, at the diſperſion of the Florentine library, it fell into the hands of Paul Petau, by whoſe ſon it was placed in the library of Chriſtina, queen of Sweden; at her deſire it was printed, for the firſt time, at Rome, in 1680. Moreri. Bower.

GELASIUS II. pope, was born of an illuſtrious family at Gaeta, in Campania. In early life he embraced the monaſtic ſtate among the Benedictines, applied himſelf with great diligence to his ſtudies, and acquired a high character for learning, abilities, and virtue. Pope Urban II. made him his ſecretary, and in the year 1088 preferred him to the dignity of cardinal deacon. Not long after this he was appointed chancellor of the Roman church. Upon the death of pope Paſchal, in 1118, he was unanimouſly choſen his ſucceſſor by the cardinals and Roman clergy, when he, who had been known before by the name of John of Gaeta, on account of the place of his birth, aſſumed the title of Gelaſius II. The imperial party at Rome were ſo enraged at this choice, which had been made without their conſent or knowledge, that Frangipani, one of the moſt powerful of the Roman nobility, aſſembled a body of armed men, broke into the church of the Benedictine monaſtery, while the cardinals were performing the ceremony of the adoration, and after cruelly beating theſe defenceleſs men, Frangipani ordered the new pope, who was already covered with blood, to be put into irons and taken to his houſe, where he was thrown into a dark dungeon. This act did not go unrevenged: the oppoſite party ſurrounded the houſe of Frangipani, with the prefect of the city, and others of the nobility at their head, threatened to ſet fire to it, and to put him and his family to death, if the pope were not immediately releaſed. This threat produced the deſired effect, the pope was liberated, and immediately after crowned with due ſolemnity. The emperor next took a violent part againſt him, and cauſed the archbiſhop of Braga to be choſen to the pontifical chair, who took the name of Gregory VIII. and was acknowledged lawful pope by all the imperial party at Rome. At firſt Gelaſius was obliged to leave the papal city, and to ſeek refuge at Gaeta, his native place, where he was received with loud acclamations, and had ambaſſadors ſent to him by the Norman princes, who declared themſelves ready to ſupport him to the utmoſt of their power. Upon the emperor's retreat, Gelaſius returned privately to Rome, where he ſuppoſed his party was ſufficiently ſtrong to drive his rival from the throne. But, during the firſt public performance of maſs, Frangipani forced his way into the church, accompanied by a large body of troops, intending to ſeize on Gelaſius, and ſend him priſoner to the emperor. The pope, however, eſcaped, and, his friends flocking together from all parts, a civil war commenced in Rome, in which numbers of lives were loſt on both ſides. The imperial party at length prevailed, and Gelaſius, deſpairing of being ever able to expel his rival, quitted Italy, and embarked for France, where he arrived in November 1118. Here he was received with all poſſible marks of reſpect and eſteem, and ſupplied by the clergy and nobility with large ſums of money, in order to ſupport him in his rank and dignity. The reigning monarch, Louis the Groſs, ſent him the moſt magnificent preſents, with aſſurances of his protection, and aſſiſtance in fixing him again on his throne. He died, however, in January 1119, having firſt viſited ſeveral cities, in the exerciſe of his pontifical functions, and appointed a council to meet at Rheims to conſult about the correction of the ſtate of eccleſiaſtical diſcipline in the Gallican churches. He was diſtinguiſhed for piety and the moſt exemplary moral virtues. In the Collectio Conciliorum are ten letters written by this pope. He was author of the "Life of Eraſmus," biſhop of Gaeta, and alſo of the "Lives of Anatolia and Cæſaria:" the firſt was written in proſe, the others in verſe. Moreri. Bower.

GELASIUS, biſhop of Cæſarea, was choſen to that high office in the year 380. He is claſſed, by St. Jerome and others, among the eccleſiaſtical writers of his age. He wrote ſeveral works, which have been commended for the correctneſs and purity of their ſtyle, but which he would not publiſh. Some fragments of the writings of this prelate, explanatory of the apoſtles' creed, and of the traditions of the church, are to be met with in the Greek collection of teſtimonies, under the name of John Damaſcenus, in the Codex Claromont. He died in 394.

GELASIUS, ſurnamed *Cyzicenus*, from the place of his birth, was ſon of a preſbyter of the church at Cyzicum, and flouriſhed about the year 476. When young, he found in his father's poſſeſſion a MS. containing an account of the proceedings of the council of Nice. As the Catholics were at this period perſecuted by the Eutychians, under the countenance of the emperor Baſiliſcus, and as that ſect boaſted that the decrees of the council of Nice were favourable to their principles, Gelaſius determined to draw up a new hiſtory of that council, with a view of confuting their repreſentations. He divided his work into three books; of which the two firſt contain the hiſtory of the council, and the third only three letters of the emperor Conſtantine,

This hiſtory, which is, in fact, nothing more than a collection of treatiſes, was publiſhed at Paris, by Robert Balfour, a Scotchman, in Greek and Latin, in 1559. It is inſerted in the ſecond volume of the Collectio Conciliorum. But Dupin ſays, that "There is neither order in his narrative, nor correctneſs in his obſervations, nor elegance in his expreſſions, nor judgment in his choice of matter; ſo that he muſt be pronounced a bad compiler who has collected, without any diſcrimination, whatever he found relating to the council of Nice, whether good or bad, not examining even whether it were true or falſe." Moreri. Dupin.

GELATIN, or ANIMAL JELLY, in *Chemiſtry*, a principle that abounds in various parts of animals, and forms one of the elementary conſtituents of animal organization. This principle is copiouſly contained in ſkin, in moſt of the ſoft and white parts, in bone, horns, and membrane, and in a ſmaller proportion in the blood, and alſo in many ſhells. From theſe ſubſtances it may be extracted by boiling in water. The watery ſolution is nearly tranſparent and colourleſs, and when allowed to evaporate and cool, it aſſumes the conſiſtence of *jelly*, which is well known. (See JELLY.) By further evaporation, this watery ſolution becomes hard and brittle, and forms *glue* or *ſize*, which ſee reſpectively.

The chemiſt is very much indebted to Mr. Hatchett's valuable experiments on gelatin, and the ſubſtances from which it is obtained. For curious and uſeful information on this ſubject, (ſee Phil. Tranſ. vol. xc.) Pure gelatin is inſipid, tranſparent, inodorous, and nearly colourleſs, or only exhibiting a ſhade of yellow. When dry gelatin is thrown into water, it abſorbs the water, ſwells, ſoftens, and becomes very elaſtic. It is not diſſolved whilſt cold, and if it be again expoſed to a warm dry air, it ſhrinks and regains its former conſiſtence. But by the application of heat to gelatin, when it is thus ſwelled by ſoaking and immerſed in more water, it forms a ſolution, exactly reſembling in chemical qualities the liquor from which the dry gelatin was prepared, of the ſame denſity, and again glutinous by cooling. It appears therefore to be an inherent and a very characteriſtic property of gelatin, that it is ſoluble in water and recoverable from the ſolution by evaporation, unaltered for an indefinite number of times, even after long application of boiling heat. In this reſpect it eſſentially differs from the ſolution of albumen, which coagulates by heat, and does not again return to its ſoluble ſtate. See ALBUMEN.

Gelatin of every kind is ſoluble in all the acids; and as the nitric acts upon it with particular energy, it may thus be ſeparated from the condenſed albumen, which is often naturally combined with it. The nitric ſolution of gelatin (*e. g.* of iſinglaſs) is of a pale yellow colour, which becomes deeper by evaporation. When much concentrated, the acid, acting at firſt merely as a ſolvent, is decompoſed by the gelatin, and gives out nitrous gas, ſometimes attended with ſparks or flame. This mutual decompoſition of nitric acid and gelatin produces alſo a quantity of the oxalic and malic acids, which may be detected in the liquor, if the concentration has not proceeded ſo far as again to decompoſe theſe new products. The acid ſolutions of gelatin give no precipitate when ſaturated with any of the alkalies or earths.

The muriatic acid diſſolves gelatin in the cold with great eaſe, and, like the nitric, ſeparates it from the denſe albumen of organized bodies, with which it is naturally combined:—and the muriatic ſolution will remain unchanged for many months.

The cauſtic fixed alkalies very eaſily diſſolve gelatin, and form a browniſh viſcid ſubſtance; giving out no ammonia during the ſolution. This viſcid alkaline ſolution, as Mr. Hatchett obſerves, does not poſſeſs the properties of ſoap, for it does not form a permanent lather when ſhaken with water, and when ſaturated with acid it affords no precipitate. This circumſtance, according to Mr. Hatchett, affords a very characteriſtic property, diſtinguiſhing pure gelatin from albumen, fibrin, and moſt other ſoft parts of animals; all of which latter form a true ſoap with alkalies, that curdles and precipitates on ſaturation with an acid.

Gelatin is inſoluble in pure alcohol, and when this ſpirit is poured into a watery ſolution of gelatin, the mixture becomes milky, and part of its gelatin ſeparates, as is the caſe with vegetable mucilages and alcohol; but unleſs a very large quantity of ſpirit is added, the mixture again becomes clear.

Hard and dry gelatin will remain unchanged for a long time; but when liquid, or in the thin gelatinous ſtate, it ſoon putrefies, becoming firſt ſour by the generation of acetic acid, then mouldy and fetid, and at laſt exhaling ammonia.

When dry gelatin is very much heated, it curls and becomes puffy, and yields an oily ammoniacal liquor, like all other ſoft parts of animals. In cloſe veſſels it leaves at laſt a bulky ſoft coal, the proportion of which, determined by Mr. Hatchett, is 56 grains from 500 of iſinglaſs. This by incineration in open air burns away entirely, except 1.5 gr. of earthy reſidue, which appears to be the phoſphats of ſoda and lime. Hence it appears that the quantity of earthy and ſaline matter is extremely ſmall, compared with that of the other ſoft parts. The ſame chemiſt alſo obſerved a kind of artificial converſion of condenſed albumen into gelatin by long digeſtion in dilute nitric acid; the albumen thereby becoming perfectly ſoluble in water, and forming a gelatinizing ſolution when reduced by evaporation.

The moſt ſingular combination of gelatin, and that which is moſt uſeful as a chemical teſt, is with tan. If a ſolution of gelatin, *e. g.* of glue or of iſinglaſs, be added to an infuſion of oak-bark, galls, catechu, or any other vegetable that contains the tanning principle, a copious white precipitate ſeparates, which, after the concentration of the liquors, may be very eaſily collected by the fingers, and forms a ſingular grey ductile maſs, ſmelling like tanned leather, and which runs into a dark brown brittle maſs, appearing like reſin, inſoluble in water, and incapable of putrefaction. For a further account of this combination, ſee TAN. The power of infuſion of tan as a teſt of gelatin is very extenſive. Dr. Boſtock found (Edinb. Med. and Phyſ. Journ.) a copious and immediate precipitate on adding a moderately ſtrong infuſion of galls to water, holding only $\frac{1}{100}$ of iſinglaſs, and a very conſiderable precipitate when the gelatin was only $\frac{1}{5000}$. The ſolutions of albumen alſo give a precipitate with tan, after ſtanding together ſome hours; and therefore, when uſed as a teſt, an immediate precipitate with tan may be conſidered as a pretty certain indication of gelatin.

The nitro-muriate of tin produces alſo a white precipitate with gelatin; but unleſs the ſolution of the latter is pretty ſtrong, the effect is only a white cloud, after ſome hours ſtanding. Nearly the ſame effect is produced with the ſolutions of albumen.

Mr. Hatchett obſerves, that the difference in the degree of viſcidity and tenacity of the varieties of gelatin is an inherent quality, and not cauſed by the degree of mere inſpiſſation; otherwiſe, when each variety was perfectly dry, they would each make a glue or cement of exactly the ſame degree of tenacity, which is known not to be the caſe. On the contrary, the tenacity depends partly on the age of the animal, the old giving a much ſtronger glue, *cæteris paribus*, than the young; and partly on the ſubſtances that furniſh it,

the glue from the ſkin being much ſtronger than the ſolid gelatin from the horns, ſinews, or any other part. In proportion as the glue is more adheſive, it becomes leſs eaſily ſoluble in water, and abſorbs a larger portion before it comes to the ſtate of tremulous jelly. Mr. Hatchett alſo found, that the force of adheſion of glue from ſkin was generally proportionate to the toughneſs of the ſkin: the ſoft flexible ſkins yielding a thinner gelatin than the hard bony ſkins, and with much more eaſe. Phil. Tranſ. ubi ſupra. Aikin's Dictionary of Chemiſtry, &c. See GLUE, JELLY, ISINGLASS, and SIZE.

GELATINOUS, is applied to any thing approaching the glutinous conſiſtence of a jelly.

GELATIO, properly ſignifies freezing, but is alſo uſed for that rigidity of the body and limbs, which comes on in the catalepſis, and other diſorders of that kind.

GELBFREUTH, in *Geography*, a town of Germany, in the principality of Culmbach; 10 miles S.S.W. from Culmbach.

GELBUM, a name given by the Hungarian miners to a ſort of marcaſite or mundic, which contains a conſiderable quantity of ſilver.

GELD, or GILD, in our *Ancient Cuſtoms*, a mulct, or compenſation for a crime or delinquency. See GILD.

Hence *wergild* was anciently uſed for the value or price of a man ſlain; and *orfgild*, of a beaſt, &c.

"Et ſint quieti de Geldis, & Danegeldis, Horngeldis, & Fortgeldis, & de Blodwita, & Fliwita, & Leirwita, & Heingwita, & Fremineſeuda, & Werdpens, & Averpeni, & Hundrepeni, & Tolingpeni." Charta Ric. II. Priorat. de Hatland, in Devon.

GELD *foot*, *Geld horn*, and *Geld wood*, ſee the ſubſtantives.

GELDA, in *Ancient Geography*, a town of Aſia, in Albania, between the mouths of the rivers Gherrus and Caſius, in the Caſpian ſea. Ptol.

GELDENHAUR, GERARD, in *Biography*, was born at Nimeguen in 1482. He was educated partly at Daventer, and partly at Louvain, where he contracted an intimacy with Eraſmus. When he had left the college, he was recommended to Charles V. who appointed him his reader and hiſtorian; after this he accepted the poſt of Latin ſecretary, and private reader to Philip biſhop of Utrecht, which he held till the death of that prelate. In 1526, he was ſent by Maximilian of Burgundy to examine the ſchools of Wittemburg. He now openly joined the Lutheran party, went to Worms, was married and undertook the education of youth. Eraſmus was diſpleaſed with his change of religion, and wrote againſt him. Geldenhaur removed firſt to Augſburg, and then to Marburg, where he was the firſt profeſſor of hiſtory, and afterwards of theology. He died in 1542. He was author of ſome pieces in controverſial theology; he publiſhed likewiſe Latin poems, orations, and epiſtles, and ſome hiſtorical works, of which the principal are "Hiſtoriæ Batavicæ;" "Hiſtoriæ ſuæ Ætatis, lib. vii." "Germanicarum Hiſtor. Illuſtratio;" "Deſcriptio Inſulæ Batavorum;" "De viris illuſtribus Inferioris Germaniæ." Moreri. Bayle.

GELDER, ARNOLD DE, a painter who was born at Dort in 1645. He firſt became a diſciple of Hoogſtraten, but afterwards ſtudied under Rembrandt, and made very conſiderable progreſs in the imitation of that maſter's manner; having a mind inclined to the ſame mode of obſerving and thinking. He remained two years with him, but did not, like the generality of ſtudents, attach himſelf to the ſtudy of the maſter's pictures only; he adopted his mode of ſtudying from nature, and, like him, made a collection of a large ſtock of thoſe articles his taſte led him to wiſh to imitate: ſuch as arms, and draperies of all ſorts; covering his walls with them, and conſtantly employing them in his backgrounds and on his figures. His principal work is a ſeries of twenty-two pictures of the ſufferings of Chriſt, which are famed for excellent chiaro-ſcuro and expreſſion. He died in 1727, aged 82.

GELDER-*Roſe*, in *Botany*. See VIBURNUM.

GELDER-*roſe*, *currant-leaved*, and *Virginian*. See SPIRÆA.

GELDING, in *Rural Economy*, a term by which young caſtrated horſes are frequently known. The term is ſeldom applied to them after they have attained the age of three years. See CANTHERII and next article.

GELDING, the operation of cutting or caſtrating any ſort of animal. The age of the animal and ſeaſon of the year ſhould be well attended to in the execution of this buſineſs. Colt-foals and tup-lambs may be gelded with advantage in moſt caſes at a very early period of their age, as at a fortnight or three weeks after they are dropped, though ſome prefer a later period for both theſe, but eſpecially for male-foals. In general, however, where the operation is performed early, the animal ſooner recovers its growth, and ſuffers much leſs check. In horſes it may however be executed at almoſt any age, where a due degree of care is afterwards taken of the animals.

In reſpect to ſeaſon, the beſt is, when a little inclined to be cool, as in the beginning of the ſpring and in the autumn.

The uſual method of proceeding in the performance of the buſineſs, is, with foals and ſtallions, firſt to caſt them upon ſome ſoft place, then to take the *teſtes* between the foremoſt and the great finger, ſlitting open the ſcrotum or bag with a ſharp knife for the purpoſe, and forcing them forward, in order that they may be laid hold of by the fingers, or a pair of ſmall nippers made for this uſe, and by that means be cut away; the ſpermatic veſſels being properly ſecured by ſtrong waxed thread ligatures. The old method was to ſear them off by a thin red hot cauterizing iron. The only thing neceſſary afterwards in the firſt mode is, merely to keep the ſides of the ſcrotum in contact. But in the old way a compoſition of roſin, wax, and turpentine, well melted together, is uſually laid over the parts by means of the hot iron. While under this treatment the animal ſhould be kept looſe in a moderately warm ſtable, in order that he may have proper exerciſe in walking about in it. In caſes where there is much appearance of inflammation, it may ſometimes be neceſſary to take away a little blood. And if the ſheath and belly ſhould become ſwollen, diſcutient fomentations ſhould be frequently applied.

In the gelding of animals of the ſheep kind, leſs trouble is commonly neceſſary, the ſhepherd moſtly performing the buſineſs. See CASTRATION.

Pliny informs us, that the Romans uſed to geld their horſes, eſpecially thoſe which they employed upon common and domeſtic occaſions; and geldings, called *Cantherii*, (which ſee,) were preferred, on account of their calmneſs of temper, to other horſes. The nations of Africa, and of Aſia, except the Chineſe, never geld their horſes; and ſome kingdoms of Europe have not yet adopted the practice. Caſtration deprives the animal of a conſiderable part of his ſtrength, ſpirit, and courage; robs him, (ſays Berenger, Hiſtory of Horſemanſhip, vol. i. p. 138.) in part, of his very *ſoul*, and leaves him a mutilated, daſtardly, and unnatural creature; but, at the ſame time, makes him mild, patient, more obedient, and conſequently fitter for many purpoſes, and more agreeable to many riders. To this purpoſe Strabo obſerves, (l. 7.) that caſtration, which, indeed,

was

was practiſed long before he wrote, was a cuſtom more peculiarly belonging to the Scythians and Sarmatians than any other nations; and they performed this operation on their horſes, for the better management of them: for though they were but ſmall, they were nevertheleſs mettleſome, and difficult to be governed. The practice of gelding horſes, which is now ſo frequent, ſeems to have been introduced by the Turkiſh or Hungarian nations, who took poſſeſſion of ancient Pannonia. The French, it is obſerved, call a gelding "un cheval Ongre," that is, an Hungarian horſe, which ſeems to indicate, that the Franks firſt learned the art and cuſtom of caſtration from the Hungarians: and it is remarkable, that to this day many Hungarians travel every year into Germany and Poland, in order to caſtrate any animal that is offered to them, which they do for a ſmall reward. It is ſaid, that they come as far as the Baltic every ſummer, and that they are very expert in their buſineſs.

GELDUM, a name given by ſome to the philoſopher's ſtone.

GELE'E Claude, in *Biography*, a landſcape painter, whoſe works entitle him to the foremoſt rank in his claſs. He was a native of Lorraine, and hence bore the name of Claude de Lorraine, by which he is better known than by his own. Notwithſtanding the extraordinary brilliancy of his talent, when devoted to painting, and fully developed in proceſs of time by continued induſtry, and proved by the grandeur and correctneſs with which he ſelected and imitated the works of nature, he appears to have been with difficulty brought forward at firſt in the art. His original eſſays of ingenuity were in the habit of a paſtry-cook, to which occupation he ſerved an apprenticeſhip. How he emerged thence, and what led him to think of painting, is not at preſent known.

Claude received ſome inſtructions from Agoſtino Taſſi, who, ſo far from finding him an apt ſcholar, with difficulty taught him the firſt rudiments of perſpective and drawing. When once, however, he began to feel their truth and force, his native ſtrength of intellect ſoon carried him beyond the ſphere of his maſter. His mind, expanding in the courſe of his ſtudies, was a ſpur to his induſtrious purſuit of the beauties of the goddeſs he adored; and never painter more truly may be ſaid to have unveiled thoſe beauties. By no one has nature been more happily pourtrayed than by this great maſter, in the art of painting.

His courſe of ſtudy was the moſt rational and uſeful that can be adopted. He conſtantly had recourſe to nature herſelf. His continual examination of her effects, and their cauſes, is the genuine ſource of that excellence to which he arrived. The open canopy of heaven was his ſtudy. It was there he conſtantly wrought, ſketching whatever was beautiful or grand; exploring the forms of natural objects, and noting their colours as they varied with the changes of light and ſhade; of combination with others, and ſeen with reflections from ſurrounding objects; or when alone, and tranſmitting the pure ethereal ray tinged with their own peculiar hues. For this purpoſe he frequently continued abroad from ſun-riſe, till the darkneſs of night compelled him, unwillingly to withdraw from his contemplations.

Sandrart ſays of him, that he was philoſophically informed; that he not only was capable of repreſenting the ever-varying productions of nature, but of reaſoning upon them, and explaining the cauſes of their different appearances; whether ariſing from diſtance, from dews and vapours, the evening or the morning light, or from differing reflections and refractions of light; and that he would do this with the clearneſs and preciſion of a man of ſcience.

The earneſtneſs with which he ſought to perfect his pictures, is evident in the labour he beſtowed upon them. To produce the ſurface they bear, numerous repetitions of colour are neceſſary; and that will only be done by thoſe who have their minds fraught with objects, which their hands do not readily perfect the reſemblance of. Their perception of truth is too ſtrong for their knowledge of the means of imitation; and therefore frequent reviſals and retouchings are neceſſary to ſatisfy them in purſuit after the actual repreſentation of nature. Claude felt all this, and brought his pictures accordingly to a high degree of perfection, by conſtantly ſuperviſing his labours with a ſtrong remembrance of the real objects; and not unfrequently altering his deſigns, and repainting them, till they perfectly correſponded with the images in his mind.

His deſigns are, for the moſt part, very agreeable, often grand, and entirely differing from the taſte of any one who had preceded him in landſcape painting. Titian and the Carracci had given a grandeur of ſubject generally derived from the more rugged ſcenes of nature. Claude, on the other hand, ſelected and united the beautiful with the grand; and aſſociated art and nature together, by the introduction of buildings into his pictures, with the greateſt propriety and richneſs of effect. The former, in their landſcapes, have not always preſerved the character of nature: there is much of the artificial apparent in them, either to command the attention of the obſerver by the force of colour, or from ſome error in the ſyſtem of art they uſed. Claude, on the contrary, never had recourſe to it; a cloſe imitation of the effect of nature was his object; and a perfect harmony of colour, of courſe the means he employed. No one, except it be our own Wilſon and Turner, have ſo completely given the effect of atmoſphere, ſo enveloped his objects with air, and relieved them ſo truly without apparent artifice from each other. Regarding a picture painted by him, is the ſame as looking into nature; his diſtances are duly kept, with ſo full, yet ſo tender an indication of the objects in the remote parts, as completely to dazzle the underſtanding when ſeen under favourable circumſtances. His colouring is of the moſt ſubtle nature, being the reſult of repetition of one colour, or layer of colour, over another; not of the tones mixed upon the pallette; and completely baffles all attempts to imitate it, except by the ſame means; which renders him extremely difficult to copy. It is not eaſy to ſay whether the luſtre which is ſo pre-eminent in his pictures be effected by the oppoſition of light and dark he uſes, the purity of his hues, or the breadth of his chiaro-ſcuro. His ſkies appear to poſſeſs an inherent light, reflecting and diſpenſing it upon the eyes of the beholders, as well as on the objects in the pictures.

The compoſitions of his larger works are principally combinations of the ſcenery ſurrounding Rome, and other places where he reſided. He took great care in the forms of his trees. As to what is ſaid by Pilkington, of his nicety of diſcrimination in repreſenting the various characters of the plants and trees he introduced; it does not appear to have been his practice in his beſt works. There is difference enough to give the appearance of nature; a fir tree grows differently from an oak, or a ſycamore, &c.; this he has marked occaſionally; but in general, his trees have one character ſelected from nature, as conveying the impreſſion of grandeur and beauty in the vegetable creation: and ſameneſs of form is rather imputed to him by ignorant obſervers. His choice, however, is perfectly juſtifiable, upon the ſame principle as that of the hiſtorical painter, who ſelects a general, rather than a peculiar, form of the human figure for his imitation.

The figures of men and animals which he introduced into his

his pictures, exhibit the effect of his unfortunate commencement in art, by their total want of drawing, and freedom of action. The idea which governs their introduction almoſt invariably excels their execution, notwithſtanding he took much pains to learn to draw in the academy at Rome, after ſtatues and living models. He was himſelf conſcious of his deficiency on this head, and frequently engaged other artiſts, ſuch as Felippo Lauri, and Courtois, to paint them for him, particularly his men and women.

In order to prevent copies of his works being ſold as his painting, and thus becoming injurious to his reputation, and to avoid frequent repetition of the ſame ſubjects; he drew, in a book prepared for the purpoſe, the deſigns of thoſe pictures he tranſmitted to different countries, and wrote upon the back of the drawings the name of the perſon to whom the original picture was ſold. This book is now in the poſſeſſion of the duke of Devonſhire, who has kindly allowed it to be engraved by Earlom, in a manner cloſely imitating the appearance of the drawings, and it is publiſhed under the title of "Liber Veritatis."

We have many of the fineſt works of this great maſter in this country, beſides an infinity of minor productions from his pencil. The principal ones here, are one in poſſeſſion of the earl of Egremont, wherein the ſtory of Jacob, Laban, and his daughters is introduced, and which has been engraved by Woollett. Another in poſſeſſion of Mr. Angerſtein, of the ſtory of the queen of Sheba's departure to viſit Solomon; and a third in poſſeſſion of Mr. Davis brought from the Altieri palace in Rome, and which has been valued at 7000 guineas. Theſe are maſter-pieces of their kind, for grandeur, richneſs, and variety of imagination in their different compoſitions; and for brilliancy, luxuriancy, and truth in their colour. He died in 1682, aged 82. "When ſhall we look upon his like again!!"

GELEITSTEIN, in *Geography*, a town of Germany, in the principality of Wurzburg; 10 miles S. of Gemunden.

GELEMAR, a town of Hindooſtan, in Oude; 26 miles S.W. of Gooracpour.

GELENAU, a town of Saxony, in the circle of Erzgeburg; 5 miles W.N.W. of Greiffenſtein.

GELFUM, or Gelbum, an Hungarian name for a kind of mundic, which contains ſilver.

GELIGONDA, in *Geography*, a town of Hindooſtan, in the Carnatic; 50 miles S.W. of Ongole.

GELISE, a river of France, which runs into the Baiſe at Lavardac.

GELLA, in *Ancient Geography*, a town of Hiſpania Tarragonenſis, in the country of the Vaccæans; ſuppoſed to be the *Tela* of Antonine's Itinerary.

GELLAH, or Collah, or *Galleh ad Snaan*, a town of Algiers, in the province of Conſtantina, near the river Serratt; built upon the eminence of a mountain, and having only one narrow road leading to it. This place is a kind of convenient aſylum for the rebels of both this and the neighbouring kingdom, where they are hoſpitably entertained, till their friends have procured their pardon, or compounded for their crimes; 86 miles E. of Conſtantina.

Gellah, a town of Africa, in the kingdom of Tunis, ſituated on a rugged promontory, to which it gives name, near the river Mejerdah: it was near this place that Publius Cornelius Scipio fixed his winter-quarters, which gave it the name of "Caſtra Corneliana;" 18 miles N. of Tunis.

GELLE', a town of Africa, in Dar-Fûr, at a ſmall diſtance N.W. of Cubcabia, and 40 miles N.W. of Cobbé. N. lat. 14° 24'. E. long. 27° 28'. Gellé, ſays Mr. Brown, (Travels in Africa, &c. p. 240.) was eſteemed leſs flouriſhing than moſt other towns of Dar-Fûr, being under the galling tyranny of a prieſt, a native of the place, and upon whom the inhabitants were dependent. His unfated avarice left them neither apparel nor a mat upon which to lie; and his malice perſecuted them, becauſe they had nothing more which he could plunder.

GELLERT, Christian Furchtegott, in *Biography*, was born in July 1715, near Freyburg, where his father was a clergyman. He received a good education in the ſchools, and in 1734 ſtudied theology at Leipſic. At the end of four years he returned home, and commenced preacher, but making no figure as an orator, he undertook the office of a private tutor. At this period he exhibited a poetical taſte, but his firſt attempts as an author were entitled, "Amuſements of Reaſon and Wit," which procured him a great deal of reſpect, as well for the agreeableneſs of his ſtyle, as for the excellence of diſpoſition which his work every where diſplayed. As an inſtructor of youth, he endeavoured not only to enrich the minds of his pupils with uſeful knowledge, but to form their taſte, improve their hearts, and inſpire them with ſentiments of religion and virtue. In 1744, he publiſhed the firſt volume of his fables, ſome plays, and the firſt original German romance worth any notice. The ſecond volume of his fables was publiſhed in 1748. He had always laboured under much ill health, and was ſubject to hypochondriacal affections, and, in 1751, he accepted the office of extraordinary profeſſor of philoſophy. He had not enjoyed the emoluments of his ſituation many months, when his complaint degenerated into inſuperable lowneſs of ſpirits, and confirmed melancholy, which embittered all the joys of life. In this ſtate, beloved by all, on account of his patience and Chriſtian reſignation, he continued to linger out a miſerable exiſtence till December 1769. The loſs of him was ſincerely and deeply lamented by his countrymen, to whom he had been a general inſtructor. "Every perſon," ſays his biographer, "who was capable of holding a pen, ſuddenly turned writer in his praiſe." His works were very numerous, and were publiſhed in ten volumes octavo, in the year 1766, and after his death a more complete edition was publiſhed at Leipſic, in eight volumes, with engravings. Kutner has celebrated his various excellencies; he ſays, "a century will perhaps elapſe, before we have another poet capable of exciting the love and admiration of his contemporaries, in ſo eminent a degree as Gellert, and of exerciſing ſo powerful an influence on the taſte and way of thinking of all ranks." Though not a genius of the firſt claſs he was an agreeable and fertile writer; the poet of religion and virtue; an able reformer of public morals, who preferred reproof to puniſhment, and ſeemed more inclined to adminiſter conſolation, than to plunge into deſpair. In his fables and ſpiritual ſongs he has diſplayed the whole force of his genius. In the former, he ſucceſsfully imitates La Fontaine, and ſhews the ſame delicate vein of humour, the ſame livelineſs and eaſe united to the keeneſt ſatire. In his tales properly ſo called, he ſeems fond of the ſerious, didactic ſtyle, and ſometimes of the tragic. His ridicule always appears in the garb of innocence, while the irony is concealed under the fineſt veil; his verſes are exceedingly ſoft and harmonious, and it may be eaſily ſeen that many of them are the fruit of long ſtudy and meditation. His proſe is not deſtitute of elegance, but it is inferior in ſtrength and fire to his more juvenile productions. No literary man was ever readier to allow the ſuperior merit of others. He ſet a great value on talents which he himſelf did not poſſeſs, and preferred learning to genius. As he required only a ſmall portion of the pleaſures or indulgences which money can procure,

procure, a ſmall income was more than ſufficient to ſupply all his wants, and he devoted a conſiderable part of it to acts of beneficence. As long as the Germans ſhall underſtand their preſent language, will the works of Gellert be read; and his character will be honoured while virtue is known and reſpected." Gen. Biog.

GELLHEIM, in *Geography*, a town of France, in the department of Mont Tonnerre; 13 miles W. of Worms.

GELLI, GIAMBATISTA, in *Biography*, an Italian poet, was born at Florence in 1498, of mean parents, who brought him up to the mechanical trade of a ſhoemaker. They had, however, given him the beſt education which their circumſtances could afford, and he became diſtinguiſhed for literature, and was, in the end, one of the chief ornaments of the academy Degli Umidi. He wrote two comedies, entitled "La Sporta" and "L'Errore," which were accounted the beſt compoſitions of the kind then in the language. He tranſlated the Hecuba of Euripides, from the Greek into the Italian. He was author of ſeveral other works, ſome on phyſical ſubjects; Diſſertations upon the poems of Dante and Petrarch; Tranſlations and Remarks on the difficulty of reducing the Italian language to rule, &c. Gelli died in 1563. Moreri.

GELLIBRAND, HENRY, was born in London in the year 1597. Having paſſed through the elementary parts of education, he was admitted a commoner of Trinity college, in the univerſity of Oxford, where, in the year 1619, he took his degree of B. A. Upon accidentally hearing one of ſir Henry Saville's lectures on mathematics, he conceived a ſtrong inclination for the ſtudy of the ſciences, and devoted himſelf to the purſuit with ſo much vigour, that, in 1623, he attracted the notice and friendſhip of ſeveral able mathematicians, particularly of Mr. Briggs, by whoſe patronage he obtained in 1626, the profeſſorſhip of aſtronomy in Greſham college. From this time he lived in cloſe intimacy with Mr. Briggs, who entruſted to him the taſk of completing his Britiſh Trigonometry, which he did not himſelf live to finiſh: to this he added a preface, and the application of the logarithms to plain and ſpherical trigonometry. During the time he was preparing this work for the preſs, he was cited into the high commiſſion court by Dr. Laud, then biſhop of London, on account of an almanack which he had publiſhed, and in which he had omitted the names of the popiſh ſaints, and inſerted thoſe of ſome of the martyrs celebrated in Fox's Acts and Monuments of the church. Upon trial, he was acquitted by the whole court, with the exception of archbiſhop Laud only, which was made an article of accuſation againſt the prelate himſelf at his own trial. Mr. Gellibrand contributed ſome pieces to the improvement of navigation: his ſituation at Greſham college, and his intercourſe with many able mathematicians, would probably have enabled him to have rendered more important ſervices to this ſcience, ſo important to the welfare of the country, had he not been immaturely carried off by a fever in 1636, when only in his fortieth year. He left behind him many valuable treatiſes in the mixed mathematics, and was highly praiſed by his contemporaries, for unwearied zeal in the inveſtigation and improvement of practical ſcience. It has been juſtly doubted whether he had a comprehenſive mind, as he could not admit the evidence which Galileo produced in defence of the Copernican ſyſtem. Biog. Britan.

GELLIVARE, in *Geography*, a town of Sweden, in the lapmark of Lulea; 98 miles N. N. W. of Lulea. N. lat. 67° 7'. E. long. 20° 24'.

GELLOSIA, in *Natural Hiſtory*, a name by which ſome of the writers of the middle ages call the chalazias.

GELMAH, or KALMAH, in *Geography*, a town of Africa, in the country of Algiers; 50 miles E. of Conſtantina. This, ſays Shaw, (Travels, p. 64.) is undoubtedly the "Calama" ſo much wanted in the Old geography, which was placed by St. Auſtin, in an indeterminate manner, betwixt Hippo and Conſtantina.

GELMAII, ancient called "Cilma," or "Oppidum Cilmanenſe," a town of Africa, in the kingdom of Tunis. This appears to have been formerly a large city, and the area of a temple is ſtill remaining; 84 miles S.S.W. of Tunis. N. lat. 35° 18'. E. long. 9° 20'.

GELMON, or GELON, or *Gilon*, in *Ancient Geography*, a city of Judah, the birth-place of Ahitophel. 2 Sam. xxiii. 34.

GELMUDEN, or GELMUYEN, or *Genemuyden*, a town of Holland, in the ſtate of Overyſſel, ſituated on the ſouth ſide of the Vecht, near the Zuyder ſee; 6 miles E.N.E. of Campen. N. lat. 52° 40'. E. long. 5° 57'.

GELNHAUSEN, a town of Germany, in the county of Hanau Munzenburg, on the Kintzig; given, in 1802, to the landgrave of Heſſe Caſſel; 12 miles E. of Hanau. N. lat. 50° 17'. E. long. 8° 15'.

GELON, in *Biography*, king of Syracuſe, was deſcended from an ancient family ſettled in the city of Gela. He firſt diſtinguiſhed himſelf in arms under Hippocrates tyrant of Gela, in whoſe employ he defeated the Syracuſans, in a battle on the banks of the Helorus. At the death of this prince he ſeized the ſovereignty of Gela, and quickly made himſelf maſter of Syracuſe by means of ſome exiles. In the year 480 B. C. when Xerxes invaded Greece, the Carthaginians ſent a very formidable army into Sicily, under Hamilcar, with a view of recovering all the places they had formerly poſſeſſed in that iſland; but while they were engaged in the ſiege of Himera, they were attacked by Gelon and entirely defeated, with the deſtruction as well of their fleet, which had been drawn up on the beach, as of their land army. The Carthaginians ſued for peace, which Gelon granted them upon certain conditions, one of which was, that they ſhould henceforth abſtain from human ſacrifices. Gelon had hitherto governed Syracuſe under the title of prætor alone, but upon this ſignal ſucceſs, the people with one voice hailed him as king, and paſſed a decree, ſettling the crown, after his death, upon his brothers Hiero and Thraſybulus. Upon his elevation to the throne, he conferred the rights of citizenſhip upon ten thouſand foreigners who had ſerved under him, and he employed the remainder of his life in anxious and laudable cares to promote the proſperity of his people. He died univerſally regretted about the year 478. He was a man of mild diſpoſition, and appears to have ruled, in general, with much lenity. The people were gratified with the confidence which he manifeſted in their affections by coming to the aſſembly, without arms and guards, and affecting to ſubmit his conduct to their free deciſion. They cauſed a ſtatue of him to be erected in the ſimple garb of a citizen, which had the ſingular fate of being ſpared at the time when all the other ſtatues of the Syracuſan kings were condemned to be melted down, at the recovery of liberty under Timoleon. Univer. Hiſt.

GELONI, in *Ancient Geography*, a people of Sarmatia, near the Boryſthenes, according to Pliny. Herodotus ſays, that the Geloni were of Greek origin, and that having been driven from their commercial cities, they ſettled in the country of the Budini. He adds, that their language was a mixture of Greek and Scythian; that they had wooden temples, like thoſe of the Greeks, adorned with ſtatues and altars of wood; and that every three years they celebrated feaſts in honour of Bacchus. They tilled the earth, lived on corn, and cultivated gardens.

GELONUM, a town of European Sarmatia, ſuppoſed by Ortelius to be different from *Gelonus*.

GELONUS, a town of Sarmatia, in the country of the Budini, which, according to Herodotus, was altogether built of wood: its walls, which were high, and on each ſide 30 ſtadia in length, were conſtructed of wood, as were alſo its houſes and temples.

GELOS, a port of Aſia, in Caria.

GELOSCOPY, GELOSCOPIA, of γελως, *laughter*, and σκοπεω, *I conſider*, a kind of divination, drawn from laughter; or a knowledge of any perſon's character and qualities, acquired from the conſideration of his laughter.

GELSEMIUM, in *Botany*, a barbarous name, corrupted from *Gelſeminum*, which is itſelf taken from *Gelſemino*, the Italian word for jaſmine. Juſs. 150. This is a genus of Juſſieu, formed of the Linnæan *Bignonia ſempervirens*, Willd. Sp. Pl. v. 3. 291, which he conſiders as akin to his order of *Apocineæ*, and which is very probably diſtinct from *Bignonia;* but we have not, any more than himſelf, ſufficient materials to make out its full characters. It is figured in Cateſby's Carolina, v. 1. t. 53, and is an elegant climbing ſhrub, with ſmooth, lanceolate, ſimple *leaves*, and axillary, funnel-ſhaped, yellow flowers. See BIGNONIA, n. 3.

GELT, in *Geography*, a river of England, which runs into the Irting; about a mile S.E. of Brampton, in Cumberland.

GELUDA, a town of Hindooſtan, in the circar of Kotta; 40 miles E. of Kotta.

GELVES, an iſland in the Mediterranean, near the coaſt of Tripoli; ſo called by the Spaniards. See GERBA.

GELUS, in *Ancient Geography*, a river of Italy, in Apulia.

GELZO, in *Geography*, a ſmall iſland in the North ſea, near the coaſt of Norway. N. lat. 69° 30'.

GEMS, a word which, in its large acceptation, denotes not only all ſuch ſtones as are valued for their ſcarcity, weight, tranſparency, luſtre, hardneſs, and conſequent durability, but has been extended to ſeveral ſoft and opaque ſtones, and even to ſubſtances not belonging to the mineral kingdom, ſuch as pearls, mother-of-pearl, coral, &c.; nor has it been unuſual, both in ancient and modern times, to apply it, without any epithet, to engraved ſtones. (See GEMS, *Engraved*.) Pliny uſes this word ſometimes in the latter ſenſe, but principally in that which is conveyed by the Greek term of λιθοι τιμιοι, or *precious ſtones;* but neither that celebrated cyclopædiſt of antiquity, nor, indeed, any of the numerous writers on this ſubject, from Theophraſtus to Anſelmus Boëtius, have furniſhed us with materials for aſcertaining to what ſpecies in the mineralogical ſyſtems of the preſent day ſeveral of thoſe precious ſtones are to be referred. The ancients would often apply the ſame name to mineral ſubſtances of different nature, and ſtill more frequently diſtinguiſh one and the ſame ſtone by many names, according as ſlight differences in colour, an additional ſpot, &c. ſuggeſted to its owner the conveniency of introducing a new denomination. Pliny undertook to collect all theſe names, and every word that has been ſaid before him on the mineral ſubſtances to which they were applied; a taſk which he performed with more induſtry than judgment and critical acumen: whence, to mention only one inſtance among many, he was led to combine all that Plato had mentioned of an iron ore, called *adamas*, with his own, ſufficiently fabulous, account of the true diamond, which latter happened to be known by the ſame appellation. But independently of this confuſion of names and ideas, both Pliny's account of gems, and that of his commentators, and of the earlier writers on this ſubject, are a tiſſue of fable and ſuperſtition; and though their ridiculous notions of the occult qualities and miraculous power with which all precious ſtones are endowed, may afford momentary amuſement, this is ſoon diſturbed by the reflection that ſuperſtition is one of the moſt odious frailties of the human mind. In juſtice to Pliny's good ſenſe, however, it muſt be ſaid that he appears to have been leſs impreſſed with a conviction of the truth of what he relates on the authority of others, than moſt of thoſe who have written on the ſame ſubject after him. There are, beſides, ſome good hints given by him to diſtinguiſh falſe from real gems: he points out external characters to be found by the feel, and derives others from tranſparency, weight, &c. and even ſhews that the faculty poſſeſſed by ſome precious ſtones of attracting, when rubbed, ſmall particles of ſtraw or paper, was not altogether unknown to him.—After Pliny, from the time of St. Epiphanias, (who wrote "De XII. gemmis in Veſte Aaronis") to the beginning of the 18th century, the writers in this department of natural hiſtory appear to have had no other object, next to that of extolling the virtues of gems in general, than to explain the nature of the twelve precious ſtones that adorned the breaſt-plate of the ephod of the Hebrew high-prieſt. It is needleſs to add, that they have thrown but little light upon the ſubject; and the ſame may be ſaid of thoſe who afterwards endeavoured to prove that the great medicinal effects to be derived from the internal uſe of precious ſtones is by no means chimerical. Among the latter was no leſs eminent a philoſopher than Boyle, who publiſhed a treatiſe on the origin and virtues of gems, the object of which is to ſhew that thoſe ſtones were originally in a fluid ſtate, or made up of ſuch ſubſtances as were formerly fluid; that many of their general virtues are derived from the mixture of metalline and other mineral ſubſtances uſually incorporated with them; while the great variety, and the particular efficacy of their virtues, ariſe from ſome happy concurrent circumſtance of their commixture, ſuch as the peculiar nature of the impregnating liquor, the proportion in which it is mixed with the petreſcent juice, &c. To ſupport his hypotheſis of the virtues of gems, Boyle ſhews, that ſeveral of them are not ſimple concretions of any petreſcent liquors, but that they conſiſt alſo of other mineral adventitious parts; which he argues from the ſeparableneſs of ſuch ſubſtances in ſome ſtones, the ſpecific gravity in others, and the different waters or tinctures to be met with in gems of the ſame ſpecies, as rubies, ſapphires, garnets, and even diamonds; of which laſt ſome are yellow, ſome of other colours. Theſe and other reaſons, ſpecious, no doubt, at the time they were given, would not, probably, in the preſent advanced ſtate of chemical knowledge, be of ſufficient force to re-introduce into practice the *Electuarium e gemmis*, *confectio de hyacinthis*, or any other of the many celebrated compoſitions of this kind with which the opulent among our forefathers endeavoured to ward off the ſtroke of death.

But what muſt appear particularly inconſequent is, that in the very period when every thing that is great and good was aſcribed to gems, the ſcientific knowledge which the beſt among the naturaliſts and phyſicians poſſeſſed of precious ſtone was ſo very ſlight, that the moſts heterogeneous mineral ſubſtances were confounded by them; and though it may have been perfectly indifferent whether a doſe of garnet, ſpinel, or ruby was adminiſtered to a patient, it cannot be ſuppoſed to have been equally ſo, when in the room of lapis lazuli (ranked among the gems) blue carbonate of

copper was ſubſtituted; which, from the reſults on record, and from the places where the ſuppoſed lapis lazuli was found, we are induced to believe did frequently happen.

At the time when mineralogy emerged from the obſcurity in which it had but too long been involved, the claſs of gems, alſo diſtinguiſhed by the appellations of *precious*, *hard ſtones*, *pierres fines*, *nobles*, *precieuſes*, *edel-ſteine*, attracted of courſe the principal notice of the ſyſtematic writers; they were, as far as the ſcientific knowledge of that period would allow it, freed of extraneous ſubſtances; theſe ſubſtances were more carefully examined, and ſeveral attempts made to define and arrange them. According to Baumer's definition, gems are the hardeſt, heavieſt, tranſparent ſtones; according to that of Wallerius, they are hard, polygonal cryſtals, infuſible, or fuſed with difficulty, particularly heavy, and of peculiar luſtre. Moſt of the writers of that period claſs them with the lapides vitreſcentes (to which moſt of the foſſils belonged that are now comprized by Werner under his flint-genus); but Linnæus, original in all his proceedings, conſidering the ſalts as the generators of cryſtallization, incorporated the different gems according to their form, as far as he was acquainted with it, among thoſe ſalts of which they reſpectively appeared to exhibit the cryſtallization. Thus the diamond, becauſe it cryſtallizes in the manner of alum, is called by him *alumen adamas*; after him Wallerius applies the term of *gemmæ pretioſiſſimæ* to thoſe precious ſtones that affect the cryſtal-form of alum; referring to them not only the diamond and ſpinel-ruby, but alſo the ſapphire and oriental amethyſt which he could certainly never have ſeen in that form; and the term of *minus pretioſæ* to thoſe that have priſmatic truncated cryſtals, and are leſs hard and ſplendid; and among theſe he has the emerald, beryl, topaze, and what he calls chryſolite and true hyacinth. Daubenton undertook to arrange the precious ſtones according to their colour, taking the ſolar ſpectre for a ſtandard, and divided them into three claſſes, *viz.* diamonds, oriental and occidental ſtones. The ſeven principal priſmatic colours formed the genera in each claſs, while the different ſhades conſtituted the ſpecies. This thought, when firſt conceived, muſt have appeared a happy one; for except in the diamond, it is the colour heightened by the luſtre of the gem which principally ſtrikes the beholder; but having formed his ideas chiefly from ſtones cut and poliſhed, that excellent man was not aware that the ſapphire alone exhibits almoſt all the varieties of colour obſerved in other gems. The chevalier Baillou appears to have been the firſt who had correct ideas reſpecting the arrangement of the precious ſtones; for in the proſpectus of a work deſcriptive of his collection, but which, unfortunately for ſcience, was never publiſhed, he ſhews that the colour is one of the moſt caſual and variable characters of thoſe ſubſtances, and that much more conſtant ones may be derived from ſpecific gravity, cryſtallization, and hardneſs, for determining which he mentions ſeveral machines of his own invention, without, however, deſcribing them. His paper was printed in the Memorie della Societa Columbaria Fiorentina 1747. Romé de l'Iſle is, we ſuppoſe, the laſt ſyſtematic mineralogical writer who introduces the gems or precious ſtones as a particular claſs of mineral ſubſtances. He divides them into gems ſtrictly ſpeaking, and into gems of the ſecond order. To the former claſs he refers, 1. The diamond. 2. The oriental ruby, ſapphire, and topaze (which three latter were firſt aſcertained by this celebrated cryſtallographer to be one and the ſame ſubſtance differently coloured). 3. The ſpinel. 4. The Braziſian ruby, ſapphire and topaze (which are all three true topazes.) 5. The emerald, Siberian beryl, and Brazilian chryſolite. 6. Saxon topaze and chryſolite. 7. The chryſolite properly ſpeaking (theſe are the apatite and aſparagus ſtone, or phoſphate of lime). 8. The hyacinth (Zircon, Haüy). To the gems of the ſecond order, are referred by him the garnet, tourmaline, and peridot of Ceylon (the latter is a yelloviſh-green variety of tourmalin), opaque rhomboidal ſchorl (ſchorl and baſaltic hornblende), together with what he calls ſchorl argileux, and ſchorl cruciforme (chiaſtolite or croſs-ſtone).

Neither of the two prevalent ſyſtems of the preſent day conſider the gems or precious ſtones as a ſeparate claſs; that of Werner, however, not profeſſing to pay great attention to their reſpective conſtituent parts, places almoſt all of them, together with ſeveral others that are not diſtinguiſhed by the name of precious ſtones, into the flint-genus, and this becauſe their more apparent characters beſpeak them rather of the ſiliceous than any other claſs of foſſils. In Hauy's ſyſtem they occupy different places of the firſt claſs "ſubſtances terreuſes," with the exception of the diamond and topaze, the former of which is claſſed with the "ſubſtances combuſtibles non metalliques," the latter, under the appellation of "ſilice fluatée alumineuſe," with the "ſubſtances acidifères."

Though, owing to a great diſſimilarity in their characters, the ſtones called *precious*, or *gems*, cannot, according to any found principles of claſſification, be made to form a ſub-diviſion in a ſyſtem of oryctognoſy; yet a certain aſſemblage of ſtones, poſſeſſed of a ſuperior weight, luſtre, and hardneſs united to comparative ſcarcity, remains ſtill, by general conſent, in the poſſeſſion of that title, and it would be affectation to refuſe acknowledging it. Nor can ſuch a diſtinction, unſcientific as it may appear, be conſidered as altogether uſeleſs. The principal department of mineralogy is undoubtedly that which deſcribes and arranges foſſil ſubſtances in ſuch a manner as to enable the ſtudent to determine the name and relations of any given unknown mineral; but this is no reaſon why we ſhould neglect other points of view in which thoſe ſubſtances may be conſidered. Thus economical mineralogy may well be allowed to arrange its materials in a manner different from that which the ſyſtematic writer would chooſe to adopt; and an aſſemblage of mineral ſubſtances, particularly valued as articles of ornament and luxury, may with propriety be made to form a ſubdiviſion in ſuch an arrangement. But though ſuperior hardneſs, luſtre, and value are ſaid to conſtitute the chief characters of the ſubſtances in queſtion, it is no eaſy matter to draw the line where the juſt mentioned properties are ſufficiently leſſened to render the epithet of *precious* inapplicable. We ſhall in this article conſider as gems or precious ſtones all thoſe apparently ſiliceous ſubſtances that, with more or leſs tranſparency, have greater hardneſs than quartz, and the ſpecific gravity of which is above 3. Their ſucceſſion is as follows: diamond, ſapphire and oriental ruby, chryſoberyl, ſpinel, hyacinth and jargon, emerald and beryl, topaze, garnet, chryſopraſe, opal, veſuvian, and chryſolite. The two laſt are precious ſtones by courteſy only. The hardneſs of chryſolite is ſcarcely that of quartz. As to the opal, though the abſence of two of the above characters would exclude it from this aſſemblage; yet it is by common conſent pronounced a firſt rate gem, often equal in value to a diamond of the ſame ſize, and muſt therefore remain with the precious ſtones.

Diamond.—Of this moſt precious of all the gems a ſufficiently detailed account has been given under that word, to which we refer, but add in this place ſome remarks more particularly connected with the ſubject of this article.

It is well known that brown, browniſh-yellow, and other

ſpots

ſpots conſiderably leſſen the value of diamonds, and that perſons concerned in their ſale endeavour to free them from theſe defects by expoſure to a certain degree of heat. This is ſometimes effected in ſmall porcelain crucibles, ſometimes by ſubjecting the diamond to the heat of the blow-pipe, in which latter caſe borax is added to prevent their acquiring a fine cruſt, which takes away the luſtre. In theſe operations care ſhould be taken that the heat be applied by ſlow degrees, and as gradually diſcontinued; ſince, in the contrary caſe, if the ſtone ſhould happen to have any incipient flaws or feathers, theſe will generally be found conſiderably to increaſe. This proceſs, however, has not conſtantly the deſired effect; for ſometimes the ſpecks will encreaſe in ſize, or exchange their colour for one perhaps ſtill leſs deſirable. Sometimes a browniſh colour is converted into red by the action of fire. Bruckmann ſaw a diamond, with a large brown ſpot before the blow-pipe in borax, aſſume a beautiful and equally diffuſed red, like that of the ballas ruby, and it was ſold with great profit as a red diamond. Another, however, with a ſpeck apparently of the ſame kind, when expoſed to the flame of the blow-pipe, became blackiſh throughout, by which change of colour its value was of courſe conſiderably diminiſhed. As to the choice of rough diamonds, (we tranſcribe what Mr. Allen has ſaid on this ſubject in a paper inſerted in the Philoſophical Magazine,) great care ſhould be taken in regard to their colour, their being free from extraneous matter, and their ſhape. The moſt perfect are cryſtalline and reſembling a drop of clear ſpring water, in the middle of which you will perceive a ſtrong light playing with a great deal of ſpirit. If the coat be ſmooth and bright, with a little tincture of green in it, it is not the worſe, and ſeldom proves bad; but if there be a mixture of yellow with green, then beware of it; it is a ſoft greaſy ſtone, and will prove bad.

If a ſtone has a rough coat that you can hardly ſee through it, and the coat be white, and look as if it was rough by art, and clear of flaws or veins, and no blueiſh caſt in the body of the ſtone, which may be diſcovered by holding it againſt the light, the ſtone will prove good.

It often happens that a ſtone ſhall appear of a reddiſh hue on the outward coat, not unlike the colour of ruſty iron, yet, by looking through it againſt the light, you may obſerve the heart of the ſtone to be white; and if there be any black ſpots, or flaws or veins in it, which by a true eye may be diſcovered, although the coat of the ſtone be opaque, ſuch ſtones are generally good.

If a diamond appear of a greeniſh bright coat, reſembling a piece of green glaſs inclining to black, it generally proves hard and ſeldom bad; ſuch ſtones have been known to be of the firſt water, but if any tincture of yellow ſeems to run within it you may depend upon its being a bad ſtone.

All ſtones of a milky coat, whether the coat be bright or dull, if ever ſo little inclining to the blueiſh caſt, are naturally ſoft, and in danger of being flawed in the cutting; and though they ſhould have the good fortune to eſcape, yet they will prove dead and milky. All diamonds of a cinnamon-coloured coat are very dubious: but if of a bright mixed with a little green, then they are certainly bad, and are accounted amongſt the worſt of colours.

The greateſt care muſt be taken to avoid beamy ſtones; and this requires greater ſkill and practice than many jewellers are equal to. By beamy ſtones are meant ſuch as look fair to the eye, and yet are ſo full of veins to the centre, that no art or labour can poliſh them; they run through ſeveral parts of the ſtone, and ſometimes through all: when they appear on the outſide, they ſhow themſelves like protuberant excreſcences, from whence run innumerable ſmall veins, obliquely croſſing each other, and ſhooting into the body of the ſtone: the ſtone itſelf will appear a very bright coat and ſhining, and the veins looking like a very ſmall poliſhed ſteel needle; ſometimes the knot of the veins will be in the centre, and fibres ſhoot outward, and the ſmall end terminate in the coat of the diamond. Stones having theſe properties are difficultly cut, and will never take a good poliſh.

Some ſyſtematic writers have given the name of *red diamond* to the ſpinel-ruby, probably on account of ſimilarity in their cryſtallization. The ſmall cryſtallized ſparkling varieties of pure rock cryſtal are frequently dignified with the name of *diamond*; thus, we have Briſtol, Corniſh, Bohemian, Tartarian, Hungarian, Sileſian, Canadian, Aſturian diamonds, diamond of Baffa, of Alençon, Dauphiny, &c.

Sapphire.—The gem next in hardneſs to the diamond is the ſapphire, compriſing, as varieties, all thoſe precious ſtones that are known by the name of oriental gems: namely, the oriental ruby, the oriental topaze, the oriental emerald. All theſe, taken together, form a ſub-diviſion of that aſſemblage of hard ſtones denominated *corundum*; which barbarous name might have been conveniently exchanged for one better adapted to European ears. The propriety of uniting the adamantine ſpar and corundum with the ſapphires, firſt occurred to Romé de l'Iſle, and his idea was afterwards followed up, with much acuteneſs of obſervation, by count Bournon, who divides the corundum, according to the two different ſtates in which it exhibits itſelf, into *perfect* and *imperfect* corundum: the former of them, conſiſting of all the above mentioned precious ſtones, was before called by Haüy *teleſie* (*i. e.* perfect body); but having followed M. de Bournon in uniting the common corundum and diamond ſpar with his teleſie, that mineralogiſt now diſtinguiſhes this latter by the name of *corindon hyalin*.

In general the name of ſapphire is given to the blue variety, which is either of a deep indigo blue, (now and then called the *male ſapphire* by lapidaries,) or of various lighter tints, ſeveral of which are ſometimes to be ſeen in one and the ſame cryſtal: the paleſt are ſometimes called *female*, or *water ſapphires*, which latter denomination is alſo applied to a blue variety of quartz. The ſapphire, more frequently than the red variety, or ruby, gradually paſſes into perfectly white or colourleſs, which, when cut, may almoſt paſs for a diamond.

A good ſapphire of ten carats is valued at 50 guineas. If it weigh twenty carats, its value is 200 guineas; but under ten carats, it may be valued by multiplying the carat at 10 ſhillings and ſixpence into the ſquare of its weight.

The red variety of ſapphire is called *oriental ruby*. Its colour is generally between a vivid cochineal and crimſon red; the latter, by an admixture of a portion of blue paſſing into violet, when it obtains the name of *oriental amethyſt*; which, without conſulting other characters, is immediately known from amethyſt quartz by its ſuperior luſtre.

A perfect ruby, above $3\frac{1}{2}$ carats, is more valuable than a diamond of the ſame weight. If it weighs one carat it is worth 10 guineas; two carats, 40 guineas; three carats, 150 guineas; ſix carats, above 1000 guineas. A deep coloured ruby, exceeding twenty carats weight, is generally called carbuncle. Of theſe 108 are ſaid to be in the throne of the great mogul, from 100 to 200 carats each.

Sapphire alſo occurs of a yellow colour, and is known as ſuch by the name of the *oriental topaze*. Its tint is generally between the dark yellow of the Brazilian, and the pale yellow of the Saxon topaze. An admixture of blue to this colour

produces the ſcarce green variety of ſapphire, called the *oriental emerald.*

Specimens, exhibiting ſeveral of theſe colours, are highly valued, both on account of their ſcarcity, and as inconteſtable proofs that difference of colour alone is not ſufficient to ſeparate ſubſtances ſo perfectly ſimilar in all other reſpects.

Beſides theſe different colours, two other properties, with reſpect to light, are obſervable in the ſapphire, which, though they proceed from an imperfection in the ſtructure of the cryſtal, are, nevertheleſs, much eſteemed. The firſt is that particular reflection obſerved in mother-of-pearl, called *chatoyement.* The other is that kind of reflection which produces the appearance of a bright ſtar with ſix rays, and which has procured the ſapphires that poſſeſs it the names of *aſterias* and *ſtar-ſtone*, and, among French lapidaries, that of *ſaphir de chat.* This beautiful variety is more frequent in the blue ſapphires than in the others. It is never ſeen in perfectly tranſparent ſtones, but is alſo obſervable in ſome of the leſs opaque cryſtals of common corundum.

The principal regular cryſtalline forms of all the ſapphires are the perfect ſix-ſided priſm, and the more or leſs acute-angled double and ſingle ſix-ſided pyramid, often deeply truncated and otherwiſe modified: they are all derived from a ſlightly acute rhomboid, which is the original or primitive cryſtal of this ſubſtance. But the rough ſapphires of commerce are generally rounded pieces, owing their form to rolling in the water, &c. In hardneſs the different varieties of ſapphire yield only to the diamond; the blue variety is ſuperior, in this reſpect, to the red, or the oriental ruby. The ſpecific gravity of blue ſapphire is from 3.907 to 4.161; that of the ruby from 3.933 to 4.087, according to Bournon.

Sapphires are found in the ſand of the rivers, at the foot of granite and trapp-rocks, particularly in Ceylon and Pegu; and they are likewiſe met with in the rivulet Rioupezouliou, at Expailly, in France. They are accompanied in Ceylon by ſpinel-ruby, tourmalin, ceylanite, and zircon. At Expailly, where they occur with iron ſand and ſmall fragments of hyacinth, they are gathered at the time when the rivulet happens to be nearly dry. The men employed in this kind of fiſhery, furniſhed with a kind of ſmall tray, with a linen bag, go up the bed of the rivulet till they arrive at ſmall depreſſions where the water has remained ſtationary: they enter them and fill their trays with the ſand of the bottom; this they waſh and ſtir with their hands under water, by which the lighter particles are carried off, while the fragments of ſapphire, &c. remain.

The ſapphires (alſo by way of excellence called *oriental gems*) claim the firſt rank after the diamond, and indeed the colourleſs variety may be conſidered as the beſt ſubſtitute for the latter. Lapidaries will often expoſe the light blue variety to the action of the fire in order to render them white and more brilliant. Brongniard obſerves, however, that the ſapphires from Expailly, inſtead of becoming colourleſs in the fire, acquire a greater intenſity of colour. Mr. Brard was aſſured by M. Picherot, a lapidary, that having left an Indian ſapphire for too great a ſpace of time expoſed to the fire, he was ſurpriſed by finding it melted into a convex ſtone (*en cabochon*) with even ſurface, though it had been cut with facets before the operation. Theſe ſtones are cut in Europe with the diamond-powder, and poliſhed with emery, a variety of the common corundum.

With regard to the above-mentioned variety, called *ſtar-ſtone*, we find it obſerved by count Bournon, that the manner of cutting it to exhibit this kind of reflection is generally, on the part of the lapidary, the reſult of chance; hence, in the greater number of the ſtones that have this property, the point from whence the ſtarry reflection proceeds, inſtead of being in the middle of the ſtone, is obſerved to be ſituated in a part more or leſs near to its baſe, by which the beauty of the ſtar-ſtone is conſiderably diminiſhed. The ſame author adds, that when an oriental ruby, or a ſapphire, which has the qualities neceſſary for the purpoſe, is intended by the lapidary to be formed into a ſtar-ſtone, he ought to make his ſection paſs below that part of the ſtone which he has found to correſpond with the ſummit of the primitive rhomboid; and as the kind of cutting moſt proper to produce this effect, is that *en cabochon* with as high an ellipſis as poſſible, the lapidary ought, at the ſame time, to take great care that the ſummit of this ellipſis be ſituated exactly under the point which correſponds with the ſummit of the rhomboid.

One of the moſt beautiful blue ſapphires is that preſerved in the collection of the Muſeum of Natural Hiſtory at Paris: it has the form of an oblique angular parallelopipedum; its weight is 132½ carats. Haüy thinks it had been cut and poliſhed; but Patrin is of the contrary opinion, becauſe no lapidary would have ever taken it into his head to give to a precious ſtone of ſuch value, a form ſo unuſual and ſo ungrateful in its effect upon the eye as the rhomboidal form. It is probable that this beautiful ſtone was really a primitive cryſtal of ſapphire, the ſides of which were afterwards poliſhed by art.

Formerly it was the cuſtom with ſome lapidaries to place the blue part of a peacock's feather under blue ſapphires, inſtead of common foil.

The ſapphire of moſt of the ancient writers appears to have been the lapis lazuli.

What is commonly called *water ſapphire*, or *falſe ſapphire*, is a blue variety of quartz; the *Brazilian ſapphire* of lapidaries is ſometimes a variety of topaze or beryl, ſometimes a blueiſh-green variety of tourmaline; and blue fluor-ſpar is now and then mentioned under the name of falſe ſapphire.

The accounts of ſmall blue and red ſapphires having been melted into beautiful large ones, by means of phoſphoric acid, &c. appear to be altogether fabulous.

Chryſoberyl.—*Chryſoberyl* of Werner, *Cymophane* of Haüy, is the ſame with the *opaleſcent* or *oriental chryſolite* of lapidaries; a precious ſtone, nearly as hard as ſapphire, and harder than topaze. Its ſpecific gravity is from 3.600 to 3.720. Its principal colour is aſparagus green; but it is only valued by the lapidary when exhibiting that kind of opaleſcence which repreſents a ſmall blueiſh-white light, undulating, as it were, in the interior of the ſtone, and changing its ſituation according to the poſition in which it preſents itſelf to the eye. There are alſo opaleſcent chryſolites, in which this kind of luſtre expands over great part of the ſurface of the ſtone, without ſhewing ſcarcely any locomotion. See CHRYSOBERYL.

This ſtone, which is alſo ſometimes called *gold-beryl*, is not frequently ſeen as an article of jewellery. Its *chatoyement* is ſometimes like that of the adularia and cats-eye; but from either of theſe ſubſtances it is eaſily diſtinguiſhed by its ſuperior hardneſs. It appears to have been confounded with the yellowiſh green beryl by thoſe writers who mention Siberia as one of the native places of this ſubſtance.

Spinelle.—The ſpinelle, both of the German and French mineralogiſts, is that precious ſtone to which the name of ruby more particularly applies: it is the ruby-ſpinel and ballas ruby of the lapidaries and jewellers. It ſcratches quartz with eaſe, but is itſelf ſcratched by ſapphire. Specific gravity about 3.7. It colour is principally red, carmine, crimſon and cherry red; from carmine it paſſes through roſe

roſe into reddiſh-white, and from cherry and crimſon-red into blueiſh-red and purple. The two laſt of theſe varieties were formerly called almandine, a name now given by Karſten and others to the noble garnet and pyrope. The cryſtal form of the ſpinel, as we ſee it in commerce, is generally that of more or leſs regular octahedra and rounded pieces. For a fuller account, ſee SPINELLE.

It is found in Ceylon and Pegu, in the ſand of rivers, accompanied with zircon, hyacinth, &c. Though it is inferior in luſtre and richneſs of colour to the oriental ruby, or red ſapphire, yet when of a certain ſize, it is much eſteemed as a gem. We are told that when the weight of a ſpinel exceeds four carats (ſixteen grains) it is valued at half the price of a diamond of the ſame weight. Mr. Brard has ſeen one at Paris of 215 grains.

It is extremely difficult, or, perhaps, impoſſible, to ſettle the ſynonomy of the ſpinel and the oriental ruby; and, indeed, ſome varieties of either of theſe ſubſtances are ſo very like one another, with regard to external characters, that, where the cryſtallization cannot be obſerved, the beſt connoiſſeurs are frequently at a loſs to diſtinguiſh them. The ſubſtances moſt commonly confounded with it are, the pyrope and noble garnet (*Barbary ruby*; *rubino di rocca* of the Italians); and the red topaze, which has obtained the name of *Brazilian ruby*, and is frequently called ballas ruby. Ignorance has alſo given the name of ruby to red fluor ſpar, and to red quartz; and it is probable that to the latter are to be referred the twelve pale rubies mentioned in Volkman's Journey through Italy, as having been preſented to the city of Venice, by the emperor John Cantacuzenus, in 1343, and each of which is ſaid to be of the weight of ſeven ounces.

Hyacinth and *Jargon* (*Zircon* of mineralogiſts). The Wernerian ſyſtem diſtinguiſhes hyacinth and jargon as ſpecies of the ſame genus; Haüy conſiders them as varieties of one and the ſame ſpecies: theſe great mineralogiſts conſequently keep both ſubſtances cloſe together. Their hardneſs is not much greater than that of the emerald; but their ſpecific gravity generally exceeds 4.4. The ſecondary form in which it uſually occurs is the four-ſided priſm, ſhorter or longer, terminated by four planes of acumination ſet on the lateral planes; or, in conſequence of a truncation of the ſolid angles of the baſe of the primitive octahedror, on the lateral edges. (See ZIRCON.) In commerce it is generally ſeen in irregularly rounded pieces.

The principal colour of the hyacinth, ſtrictly ſpeaking, is that particular yellowiſh-red, well known by the name of hyacinth red, which paſſes on one ſide into orange-yellow, on the other into reddiſh-brown. Many are the ſubſtances that have been confounded with it: the *oriental hyacinth* is the orange-coloured ſapphire; the *occidental* is a deep coloured, and the *hyacinthe miellée*, a honey-coloured variety of topaze; the *hyacinthe la belle*, and the *hyacinth of Diſſentis*, are deep orange-coloured varieties of the noble and common garnet; the *volcanic hyacinth* is the Veſuvian or Idocraſe. Moſt of theſe ſubſtances are generally ſuperior in brilliancy and value to the real hyacinth, which is the leſs eſteemed, as it ſeldom occurs of a moderate ſize without being impure and faulty.

The name of *jargon*, a corruption of zircon, is generally given to thoſe varieties of hyacinth which are nearly colourleſs, greeniſh, blueiſh-grey, and alſo browniſh-red. The firſt of theſe are moſt eſteemed; whence art imitates them by expoſing light-coloured varieties to the action of fire, which renders them colourleſs. In this ſtate (whether produced by art or nature) they are improperly called *diamans bruts* by French jewellers, and often ſold for real diamonds of inferior quality. But as very ſmall brilliants, it is often difficult to diſtinguiſh the beſt ſort from real diamonds: whence they are frequently employed for ornamenting watch-caſes, &c. The other varieties are not ſo much eſteemed. Emmerling ſays they are principally uſed as an ornament in mourning dreſs.

The hyacinth and jargons are brought from Ceylon, and other parts of India. Hyacinths in ſmall cryſtals and fragments, ſome of them fit to be cut, are alſo found in the rivulet Rioupezouliou, in Italy, &c. but thoſe of Spain, deſcribed by Bowles and others, are nothing but quartz cryſtals, vulgarly called in Spaniſh *jacintos de Compoſtella*.

Topaze.—This gem, to diſtinguiſh it from the yellow variety of ſapphire, is ſometimes called *occidental topaze*; though this name is alſo given to a variety of rock cryſtal. It is inferior to ſpinelle in hardneſs, but it is harder than emerald. Born ſtates its hardneſs compared with that of the diamond, to be as ſeven to one. Its ſpecific gravity is 3.5.

It occurs colourleſs, like pure rock cryſtal, yellow, red, and blue. Among the colourleſs variety, the Siberian appears to be the beſt; but it is alſo found of very fine luſtre in the Brazils and in New Holland, where it has been lately diſcovered occurring chiefly as rolled pieces.

The yellow is the uſual and characteriſtic colour of this ſtone; it occurs as pale wine and ſtraw colour in the Saxon topazes; it is ſometimes ſo very faint, that the cryſtals appear almoſt colourleſs. In the Brazilian yellow variety, it is generally of a deep wine colour, which paſſes through orange mixed with red into a pretty pure fleſh red. This red colour or pink is ſaid to be often artificially produced by heating the cryſtals to a certain degree, and it is ſuppoſed that the gems ſold for *Brazil rubies* are nothing but topazes, thus altered by heat. They go alſo by the name of *rubicelle* or *rubacelle*, but not by that of *rubaſſe*, which is common rock cryſtal, heated and coloured red by the abſorption of a red ſolution.

The white Brazilian topazes have often a tinge of blue, which is ſometimes ſufficiently intenſe to procure it the appellation of *oriental aquamarine*; in the ſame manner as the Saxon topaze, when ſhewing a faint admixture of green, is ſometimes called *Saxon* or *occidental chryſolite*. It is now and then ſeen of a pale lilac blue, but frequently what is exhibited as topaze of this colour, turns out to be nothing but a very pure variety of amethyſt-quartz.

The croſs fracture of all varieties of topazes is perfectly ſtraight foliated.

The ſecondary cryſtalline forms, more frequently occurring among the topazes of commerce, are four, eight, and ſix-ſided oblique priſms, generally with longitudinal ſtreaks, and eſpecially in the Brazilian, terminated by a low four-ſided pyramid, which is now and then deeply truncated. The white Siberian topaze is often found in very large cryſtals, which are, however, in general leſs pure than the middle-ſized and ſmall ones: when heated they give ſigns of electricity.

The Brazil topazes are ſaid to be found imbedded in clay; but they are brought to Europe in detached cryſtals, generally acuminated on both extremities, one of which, when heated, exhibits poſitive, the other negative electricity. The Saxon topaze, which is moſtly ſeen in cryſtals broken on one extremity, or ſtill attached to its matrix, which is generally a particular rock called topaze-rock, becomes electric by friction. For a more complete deſcription, ſee TOPAZE.

The topazes are not ſufficiently ſcarce to be much valued by the jeweller and lapidary; the deep yellow variety from the Brazils is in general preferred to the pale ſort, though the latter is often ſuperior to the former, both in fire and hardneſs. From Hawkeſworth's account of Cook's firſt voyage,

voyage, we ſee that there were at that time three ſorts, of different value, ſold at Rio de Janeiro, and diſtinguiſhed by the names of *Pinga d'Agua qualidade primeira*, *Pinga d'Agua qualidade ſegunda*, and *criſtallos amarellos:* they were then ſold, large and ſmall, good and bad together, by octavos or eighth parts of an ounce, the beſt at 4*s.* 9*d.* The *Pinga d'Agua* are probably the white ones, a fine ſort of which is now called *da mina nova*.

The above-mentioned topaze-rock, of Schneckenſtein, is a mixture of quartz, ſhorl, topaze, and lithomarge, and its powder is uſed for poliſhing the topazes it contains. Another mode of poliſhing the Saxon topaze, as mentioned by Mr. Kern, is that on a diſk of copper, by means of tripoli, with the addition of ſpirits of wine.

The name of this gem is ſaid to be derived from that of an iſland in the Red ſea, where the topaze was firſt diſcovered by the Greeks. The topaze of the ancients, however, does not appear to have been the ſame with our's: it is deſcribed as of a green colour, and ſeems to anſwer to the chryſolite of the preſent day.

Subſtances, to which the name of topaze is improperly applied, are the *oriental topaze*, which is the yellow ſapphire; the *Bohemian topaze*, ſometimes called *occidental topaze*, is a yellow, and the *ſmoaky topaze*, a blackiſh variety of rock cryſtal, called alſo cairn-gorum. The yellow variety of Siberian beryl is likewiſe improperly diſtinguiſhed by the name of *topaze*, as is a variety of hyacinth or zircon, and of olivine; the yellow variety of fluor-ſpar is called *falſe topaze*.

Emerald and Beryl.—Theſe two are ſo nearly allied both in external and other characters, that moſt ſyſtematic mineralogical writers have thought proper to unite them as varieties or ſub-ſpecies of one and the ſame ſpecies. Karſten calls the former *ſmooth*, the latter *ſtriated emerald*. Their hardneſs is rather greater than that of quartz, which they ſcratch with difficulty. Specific gravity 2.7. See EMERALD.

In common life that variety only is denominated *emerald*, which exhibits the beautiful pure priſmatic green, without any apparent predominance of either yellow or blue. Of that intenſe colour it has only been found in Peru, where it occurs in the valley of Tunia or Tomana, near New Carthagena, between the mountains of Granada and Popayan. Such emeralds are alſo brought to Europe from many parts of the Peruvian coaſt, from point St. Helena, up to the bay Bonaventura. The largeſt emerald on record is that deſcribed by Garcilaſſo de la Vega, as having been of the ſize of an oſtrich's egg; it was in the poſſeſſion of the inhabitants of the valley of Manta in Peru, where, when the Spaniards arrived, it was worſhipped under the name of the goddeſs or *mother* of emeralds; and the ſmall ones that were brought as offerings, the prieſts diſtinguiſhed by the name of the *daughters*.

The large emerald, of the weight of twenty-eight pounds and three quarters, at Reichenau, a monaſtery on an iſland of the lake of Coſtanz, is ſtated to be *green fluor* by Mr. Coxe, on whoſe authority, ſince the treaſure is no longer exhibited, every writer on this ſubject pronounces it to be fluate of lime. But long before that gentleman, Mr. Von Beroldingen had examined the ſubſtance, and found it to be *glaſs*. Which of the two travellers is in the right? If it be the latter, it would appear that Mr. Coxe has been miſled by the German word *fluſs*, which is generally applied to fluor, but likewiſe denotes flux, in the ſenſe in which enamellers uſe it.

Mr. Buſching aſſerts, that the emerald cauſes much labour to the lapidary to cut it; but this appears to be contrary to experience, and we know that the emerald is one of the ſofteſt of the precious ſtones. It is generally cut in thick tables with ſmall facets ſurrounding the border. Emeralds of the firſt quality require no foil, but are, like diamonds, placed on a black ground; thoſe of inferior luſtre receive a green gold foil, in the room of which a gloſſy green ſattin was now and then ſubſtituted in former times.

What the ancients meant by *ſmaragdus*, is a queſtion which has engaged the attention of a great number of antiquaries, and many opinions have been formed, of which the moſt plauſible is, that the Greeks and Romans dignified by that name all fine ſtones of a green colour both tranſparent and opaque. The emerald of the preſent day may have been among the ſubſtances called ſmaragdus; and, indeed, the deſcription given by Pliny of that of Scythia, Bactria, and Æthiopia, agrees very well with it. If ſo, it is clear that the green emerald, which we ſuppoſe confined to Peru, has formerly been found alſo in the old world.

The precious ſtone, called *oriental emerald*, is the green and ſcarce variety of ſapphire; the *Brazil emerald* is a green tourmalin; the *Carthagena emeralds* are nothing but green fluor ſpar, as are thoſe (according to Haüy) called *emeraudes morillons* and *nègres-cartes*; of the two latter, however, Patrin obſerves that they are real American emeralds, but of inferior quality.

The *beryl*, alſo vulgarly known by the name of *aquamarin* (more vulgarly *egg* or *eagle-marin*), is generally ranked among the gems: its cryſtals are of a more obviouſly lamellar ſtructure, much larger than the green emeralds, and though their blue colour often paſſes into green, this is never of a vivid kind, but generally oil and mountain-green and greeniſh-yellow. (See EMERALD, *Beryl.*) When of honey or wine-yellow, the beryl is called *honey-emerald*, or *emeraude miellée*.

A greeniſh variety of quartz, the apatite, and cyanite, are ſometimes confounded with beryl; and the London lapidaries give this name to fine pellucid carnelians. (See GEMS, *Engraved.*)

There ſeems to be no doubt that our beryl is the ſame with ſome of the ſtones thus named by the ancients.

Beryls are cut with emery on a leaden diſk, and poliſhed on a pewter diſk with tripoli.

The deep greeniſh aquamarins are ſet with a ſteel-coloured or greeniſh-blue foil; the pale ones are either placed, like the diamond, on a black ground, or, what has a better effect, on a ſilvery foil.

Garnet.—Blood and cherry-red, blueiſh-red, yellowiſh and hyacinth red. Hardneſs greater than that of quartz. Spec. grav. 3.4—4.3.—Werner, and ſome other modern mineralogiſts, have ſeparated from the noble garnet, the Bohemian or that variety which is found only in rounded pieces, calling it *pyrope*; and Karſten has given the name of *almandine* to that variety which is often called *oriental* or *Sorian garnet*. If ſubdiviſions of a mineral ſubſtance are required, thoſe that make them ſhould be cautious in applying to them ancient vague denominations, or names already given in common life to ſubſtances different from thoſe that are to be thus diſtinguiſhed. Neither of the juſt-mentioned writers is able to prove, or even to render it probable, that the ancients underſtood by thoſe appellations the precious garnet; *pyropus*, *carbunculus*, *carbo*, *anthrax*, were, with them, names for all ſorts of red ſtones endowed with a certain degree of luſtre, but principally for the pure red ſapphire and ſpinelle; and, on the other hand, the names both of pyrope and almandine are ſometimes given by modern lapidaries to the blueiſh-red variety of ſapphire, called alſo the oriental amethyſt.

The only diſtinction made by jewellers, with regard to garnets, is that they call *oriental* thoſe of a richer deep blood red, whatever be the part of the world from which they come,

come, and *Syrian* (meant for *ſorian* or *ſirien*), thoſe that ſhew an admixture of blue; though this latter name is given by Boetius to a yellowiſh-red variety. Garnets, in which the yellow predominates, are by the Italians called *jacinto guarnacino*, to which alſo the *iacinthe la belle* appears to belong.

Even the fineſt of the noble garnets have a ſombre appearance if compared with the ruby, whence lapidaries, to remedy this defect in ſome meaſure, will often cut the ſtones with a conſiderable concavity on one ſide; in which ſtate they are called *garnet cups*.

The deep red variety of the noble garnet, from Greenland, which occurs only maſſive, in curved lamellar concretions, appears to be worthy to be employed for ornamental purpoſes.

Chryſopras.—This ſemi-tranſparent ſtone, of a beautifully apple-green paſſing into graſs-green, deſerves to be ranked with the gems or precious ſtones, as well on account of its hardneſs, which far exceeds that of quartz, its ſpecific gravity, which is 3.25, and on account of its value as an article of jewellery, in all which reſpects it ſurpaſſes the true varieties of quartz, to which ſpecies it is referred by the French ſchool under the name of *praſe*: but Werner's praſe is a dark-green variety of true quartz. It is much eſteemed as a gem; a ring ſtone of the pure uniformly apple-coloured, nearly tranſparent variety, that ſhews no paler ſpots, has often been ſold for twenty guineas and upwards.

The oxyd to which the Sileſian chryſopraſe owes its pleaſing colour, is that of nickel; we ſhould therefore ſuppoſe it to be permanent; but the fact is, that the colour of chryſopraſe is very changeable; it is altered both by being expoſed to moiſture and to heat. Lapidaries even pretend that great care ſhould be taken in poliſhing it; for if, for want of ſufficient moiſture, or by the too rapid motion of the wheel, it be over-heated in the act of poliſhing it, it is ſaid to become whitiſh or turbid. Bruckmann placed a poliſhed, but not perfectly pure, chryſopraſe on the heated ſtove in his room, and after ſome weeks found it quite opaque, of a dirty dark-green colour, and full of black flaws.

Jewellers formerly uſed to place a gold foil under the more tranſparent Sileſian chryſopraſes.

Its comparatively high price has produced excellent imitations in paſte; but they are eaſily known by their inferior hardneſs and greater ſpecific gravity, the metallic oxyd with which the glaſs is coloured being probably lead.

The *Opal*, or *noble opal*, to diſtinguiſh it from the common and ſemi-opal that have no vivid colours, is a very brittle ſtone, and its ſpecific gravity ſeldom exceeds 2; but the beautiful play of colours ariſing out of theſe very imperfections, the brilliant blue, green, red, and yellow-coloured ſpots, variouſly mixed and modified, have, notwithſtanding its inferior hardneſs, procured it a diſtinguiſhed place among the gems. In modern times fine opals of moderate bulk have been frequently ſold at the price of diamonds of the ſame ſize; the Turks are uncommonly partial to it; but the eſtimation in which it was held by the ancients (who alſo called it *pæderos*, or child beautiful as love), ſurpaſſes belief; indeed, Nonius, the Roman ſenator, preferred baniſhment to parting with his favorite opal which was coveted by Marc Antony. But it is very probable that many of the ſtones deſcribed by ancient and modern writers as beautiful opals of great hardneſs were opaleſcent ſapphires. In modern times, too, many fine glaſs paſtes have been ſold at enormous prices for *oriental opals*; for this is the name given to the moſt brilliant varieties, though none of them are known to be found out of Europe, the moſt brilliant coming from Hungary. The lapidaries, who generally cut the opal ſimply *en cabochon*, which form is the moſt advantageous for its play of colours, diſtinguiſh ſeveral varieties of this ſtone, ſome of them belonging to the ſub-ſpecies, called common and ſemi-opal by Werner. That in which the colours appear as ſpecks or ſpangles, the French jewellers call *opale à paillettes*, that with flakes, or lengthened ſpots, is known by the name of *opale à flammes*: they farther diſtinguiſh the *yellow opal*, which is eſteemed only when it is of a brilliant gold yellow; the *blackiſh opal*, with faint, particularly reddiſh or violet colours, appearing ſometimes in the manner of burning nearly extinguiſhed charcoal; the *wine-opal*, in which, when held between the eye and the light, the yellowiſh-red predominates; if it appear quite red when viewed in this poſition, it is called *giraſol*, which name is alſo given to the corundum-ſtar ſtone; the *milk-opal*, milky white, ſometimes but imperfectly tranſparent, appearing blueiſh and reddiſh blue when held againſt the light, and offering here and there ſmall ſpecks of green and purple. The matrix of the opal, a dark grey diſintegrated porphyry, with brilliant particles of opal diſſeminated, is likewiſe ſeen cut into ring ſtones, &c. If this porphyritic ſubſtance is found to be perfectly black, (in which caſe the diſſeminated noble opal appears to ſtill greater advantage,) the black colour is in general artificially produced by ſoaking the ſtone in oil, and ſubjecting it to the action of the fire; the carbonaceous matter thus produced remains in the pores of the matrix, while the diſſeminated grains of opal, provided the heat had not been too intenſe, retain their original brilliancy.

The variety of ſemi-opal, called *oculus mundi*, or *hydrophane* (becauſe it becomes tranſparent and often even irideſcent when immerſed in water, but returns to its original ſtate of opacity as ſoon as the abſorbed moiſture is again evaporated), is ſometimes ſet in rings *au jour*, and the rate at which even the ſmalleſt of theſe ſtones were formerly ſold is truly ridiculous; at preſent their price is conſiderably lowered, though they ſtill continue to be objects of curioſity. It is found in Hungary, Iceland, and Hubertſburgh, &c.: many that come from the two laſt mentioned places acquire both tranſparency and irideſcence by imbibing water. See HYDROPHANE.

Two or three other ſubſtances that rank by courteſy among the gems, but are ſcarcely of the ſame hardneſs with quartz, are the Veſuvian (idocraſe of the French ſchool), and the chryſolite and olivine, united by Haüy under the name of peridot.

Veſuvian, (*idocraſe* of Haüy,) known alſo by the name of *hyacinthine*, or *brown volcanic hyacinth*, is ſufficiently hard to ſcratch quartz; its ſpecific gravity is about 3.4; it is ſenſibly double-refracting; its colour is generally reddiſh-brown, often approaching to hyacinth red, but likewiſe olive-green of various depth and even blackiſh-green. Its fracture is vitreous, uneven: the primitive form of its cryſtals, which have a poliſhed ſhining ſurface, is a very ſhort priſm with ſquare baſe; the ſecondary cryſtals are formed by the truncation of all the edges. (See VESUVIAN.) It is often difficult to diſtinguiſh it in its natural ſtate from common garnet; Sauſſure, deſcribing a yellowiſh-red variety of the latter found at Diſſentis, was miſled to conſider it as the ſame with Veſuvian. Its ſpecific gravity and hardneſs are inferior to thoſe of garnet. It is often very difficult to diſtinguiſh it from chryſolite when cut and poliſhed: for both agree in ſpecific gravity and double refraction, ſo that no diſtinctive character remains except a ſlight difference in colour, which is generally of a lighter olive-green in the chryſolite than in the Veſuvian, and in the latter is commonly obſcured by an admixture of black.

black. From the Braſilian tourmaline it is eaſily diſtinguiſhed by not being electric except by friction, while the tourmaline becomes electric by heat.

The more tranſparent varieties of the Veſuvian or idocraſe are cut and poliſhed by the Neapolitan lapidaries, who ſell them to travellers as objects of curioſity, under the name of *Veſuvian gems*; but they are of little value and ſeldom employed as articles of jewellery. Dr. Bonvoiſin has lately deſcribed a beautiful variety of this ſubſtance, under the name of *peridot-idocraſe*: it is found in the ſerpentine rock Teſta-Ciarva, in Piedmont, in cryſtals of a delicate green colour, paſſing ſometimes into yellowiſh-red, or wine colour.

Chryſolite, or Peridot.—Its uſual colour is a high piſtachio-green, approaching ſometimes to olive-green, more rarely to graſs-green: it is alſo found paſſing into reddiſh-clove brown, but this variety is no object of jewellery. The general form of its cryſtals is that of a flattened priſm of from four to eight lateral planes, with a pyramidal or cuneiform ſummit, which is often truncated. It has conſiderable double refraction. Its geognoſtic ſituation is not well known, nor even the country from which it comes: that which is more particularly an article of commerce is brought to Europe from the Levant.

The colours of the chryſolite, though not vivid, are chaſte and pleaſing; but the hardneſs of this ſtone is ſo inconſiderable that it ſoon becomes dull and unſightly when uſed for ornament; hence it has never been much valued, for, indeed, according to a ſaying among French lapidaries,

"Qui a deux péridots
En a un de trop."

What is not eſteemed is generally neglected, and conſequently confounded with other things it may reſemble: thus the chryſolite (which name was probably given by the ancients to our topaze), has been jumbled together with the following ſubſtances, ſome of them more, others leſs precious than itſelf: 1. *Chryſoberil*, either ſimply or with the epithets of *oriental* and *opaleſcent*; 2. Light-green *zircon*, from Ceylon; 3. Yellowiſh-green *topaze*, from Saxony; 4. Yellowiſh-green *beryl*, from Siberia; 5. Piſtachio-green *tourmaline*, from Braſil; 6. *Prehnite*, from the Cape; 7. Tranſparent yellowiſh-green *garnet*, from Saxony; 8. Light-green var. of *Veſuvian*, (idocraſe, Haüy); 9. *Augite*, (pyroxène, Haüy); 10. Olive-green *quartz*, from Glatz, &c.; 11. *Aſparagus-ſtone*, from Caprera, near Cape Gate, in Murcia, Spain; 12. Piſtachio-green *apatite*; 13. *Fluor-ſpar*; not to mention the *olivine* with which the chryſolite is united by the French ſchool of mineralogy.

Olivine, though ſometimes found in large rounded maſſes, in baſalt, &c. being ſtill ſofter and leſs ſightly than the real chryſolite, has, for aught we know, never been employed for purpoſes of ornament.

The *art of imitating gems*, or precious ſtones, is intereſting as a branch of experimental chemiſtry, and (though fraud and vanity may have been the principal cauſes that brought it to early perfection) venerable on account of its remote antiquity. The Egyptians were undoubtedly in poſſeſſion of this art, as ſeveral valuable relics have ſufficiently proved. Pliny tells us, that the Greeks and his countrymen were equally ſkilful in imitating emeralds and other tranſparent ſtones, by colouring cryſtals; they alſo manufactured onyx and ſardonyx, by cementing red and dark coloured to a white layer of chalcedony. Their paſtes or impreſſions of engraved gems, their cubes, &c. for moſaic pavement, their beautiful vaſes with figures in bas relief, are ſtill ſubjects of admiration to the curious. But alſo at this preſent day we are in full poſſeſſion of the art of counterfeiting precious ſtones; indeed, there is none, except the noble opal, which has been found too difficult for imitation. It is no eaſy matter, by mere inſpection, to diſtinguiſh the better kind of factitious ſtones or paſtes from the real gems, for which they are ſubſtituted; and the difficulty of diſcriminating them increaſes in proportion as it becomes impracticable to examine into thoſe external and phyſical characters by which they were eaſily diſtinguiſhed before they had paſſed through the hands of art. But a deficiency in luſtre, a low degree of hardneſs, yielding, even in the moſt perfect paſtes, to the edge of a knife, and their ſpecific gravity ſeldom exceeding that of common glaſs, are among the ſureſt criteria by which theſe artificial productions may be diſtinguiſhed. With regard to the laſt of theſe characters, however, it ſhould be obſerved, that what has been ſaid above, of the ſuperiority of the artificial over the true chryſopras, in point of ſpecific gravity, may paſs for an exception.

Coloured glaſſes, deſtined to imitate the diamond and other precious ſtones, do not differ from enamel except in their being tranſparent. Enamel loſes this tranſparency on account of the oxyd of tin which generally forms the baſe, and which is very difficult to vitrify. (See ENAMEL.) The coloured glaſſes, on the contrary, preſerve their tranſparency, becauſe the metallic ſubſtances uſed for colouring them undergo a complete vitrification, and intimately combine with the molecules of the glaſs. The requiſites of good artificial precious ſtones conſiſt in their being as hard as poſſible, without veſicles, of a perfect tranſparency; and in the brilliancy and equality of the colours. The laſt-mentioned quality depends on the exact mixture before fuſion. The longer the coloured glaſſes are expoſed to the action of the fire, the harder they become, and the more they are freed from veſicles. But this long continued action of the fire deſtroys and volatilizes the colouring matter, with the exception of the blue colour made of cobalt, which reſiſts the ſtrongeſt fire, and with which, therefore, artificial glaſſes of a high degree of hardneſs can be prepared. It is this impoſſibility of fixing the other colours, which renders the art in queſtion ſo difficult, and obliges moſt artiſts to be ſatisfied with ſoft glaſs, which loſes its poliſh by the ſlighteſt rubbing.

Neri's work, on the art of glaſs making, contains a great number of proceſſes to colour both glaſs and cryſtal; but thoſe who have repeated the experiments of this writer have not in all caſes been ſatisfied with the reſults they obtained. Kunkel, the commentator on Neri's work, has likewiſe deſcribed various methods of making artificial gems; he has been copied by all authors who have ſince written upon the mode of colouring glaſs, and great encomiums have been beſtowed on him by the adepts in this art. But a more modern writer on this ſubject is M. Fontanieu, who has given, in the Journal de Phyſique, an account of his experiments, which are ſaid to have been frequently repeated with the beſt ſucceſs, and to deſerve more attention than thoſe of others.

The firſt object of M. Fontanieu's reſearches, was to produce a perfectly colourleſs cryſtal, proper to take the colour intended for it, and this he calls *fondant* or baſe. They are five in number.

Firſt Baſe.—Two parts and a half of lead in ſcales, one part and a half of rock cryſtal or prepared flints, half a part of nitre, the ſame quantity of borax, and a quarter part of glaſs of arſenic, (by "parts" the author means eight ounces, hence in this caſe the quantity of the ingredients is, lead in ſcales 20℥, rock-cryſtal 12℥, nitre 4℥, borax 4℥, arſenic 2℥) being well pulverized and mixed, form the compoſition

of

of the firſt baſe. This mixture being put into a Heſſian crucible, and ſubmitted to the fire, is converted into frit. When perfectly melted it is poured into cold water; after which it is melted a ſecond and a third time, always in a new crucible, and care is taken that the water for each renewal of the proceſs be perfectly clear, and that the lead which may happen to be revived be ſeparated from it.

Second Baſe.—Two parts and a half of white ceruſe, one part of prepared flints, half a part of ſalt of tartar, and a quarter part of calcined borax. This mixture is melted in a Heſſian crucible, and poured into cold water; it is then to be melted again, and waſhed a ſecond and third time, as in the former proceſs.

Third Baſe.—Two parts of minium, one part of rock-cryſtal, half part of nitre, and as much ſalt of tartar, being well mixed and melted, are poured in cold water, in the ſame manner as the former.

Fourth Baſe.—Three parts of calcined borax, one part of prepared rock-cryſtal, and one part of ſalt of tartar, are well mixed and melted, and poured into luke-warm water. After being dried the maſs is mixed with an equal quantity of minium, melted and waſhed ſeveral times, as directed above.

Fifth Baſe, or Mayence Baſe.—This is one of the fineſt cryſtalline compoſitions our author is acquainted with. Three parts of ſalt of tartar, and one part of prepared rock-cryſtal, are mixed and made into frit, on which, after it has cooled in the crucible, warm water is poured to diſſolve it. This ſolution being decanted into a ſtone-ware pan, aquafortis is gradually poured into it, until it ceaſes to effervеſce. The water is again decanted, and the frit is waſhed in luke-warm water, until it has no longer any taſte. The frit is then dried, and mixed with one part and a half of fine ceruſe, or white lead in ſcales; this mixture muſt be well levigated, being beſprinkled at the ſame time with diſtilled water. To one part and a half (12 ounces) of this powder dried, add an ounce of calcined borax; let the whole be well mixed in a marble mortar, then melted and poured into cold water, as the other baſes already deſcribed. Theſe fuſions and lotions having been repeated, you mix with the whole powdered compoſition a twelfth part of nitre. This new mixture being melted for the laſt time, you will find in the crucible a beautiful cryſtalline maſs, poſſeſſing, as the author expreſſes himſelf, much of the *Orient.*

It ſhould have been obſerved before, that Mr. Fontanieu begins his operation with preparing the ſiliceous ſubſtances he employed for the proceſſes juſt deſcribed; he places them in a degree of heat capable of making the maſs red hot, after which he pours it into cold water, next he decants the water, and having dried the flinty maſs, he pounds it, and ſifts the coarſe powder through a ſilk ſieve; he then digeſts it during ſome hours with muriatic acid, which diſſolves the heterogeneous matter often mixed with the ſand; he then pours off the acid, waſhes the ſand ſeveral times to take away the acid remains; dries it, and paſſes it a ſecond time through the ſieve.

The ſubſtances employed for colouring factitious gems are metallic oxyds; and on the proper preparation of theſe oxyds depends the vividneſs of the colours.

1. From *Gold.*—To obtain the purple colour known by the name of precipitate of Caſſius, Mr. Fontanieu employs three different proceſſes, of which the following, as he acquaints us, is by far the beſt.

Diſtil in a glaſs retort, placed in a bath of aſhes, ſome gold diſſolved in aqua regia, made with three parts of nitrous, and one part muriatic acid; when the acid is paſſed over, and the gold contained in the retort appears dry, leave the veſſel to cool, then pour it into ſome new aqua regia and proceed to diſtil as before. Replace the aqua regia twice upon the gold, and diſtil the ſame. After theſe four operations, pour by little and little into the retort ſome oil of tartar per deliquium, which will occaſion a briſk effervеſcence; when this ceaſes, diſtil the mixture till it becomes dry, and then put ſome warm water into the retort. Shake the whole, and put it into a cucurbit, when a precipitate is depoſited, the colour of which is ſometimes brown and ſometimes yellow. After having waſhed this precipitate, dry it. The mineral purple thus prepared is ſaid to be much ſuperior to that of the two other proceſſes propoſed by M. Fontanieu, ſince two grains of it only are ſufficient to an ounce of the baſe, whilſt it requires of the other two a twentieth part of the baſe. The ſame author found alſo the means of exalting the colour of the precipitate of Caſſius by putting to it a ſixth part of its weight of glaſs of antimony finely powdered, and of nitre in the proportion of a drachm to eight ounces of the baſe.

2. From *Silver.*—The oxyd of ſilver being vitrified, produces a yellowiſh-grey colour. This oxyd enters only into the compoſition of the yellow artificial diamond and opal. Mr. Fontanieu introduces it into the baſe in the form of horn ſilver (*luna cornea*). In order to prepare it, he diſſolves the ſilver in nitrous acid, and afterwards pours into it a ſolution of ſea ſalt: a white precipitate is obtained, which, being waſhed and dried, melts very readily in the fire, and is ſoon volatilized, if not mixed with vitrifiable matter.

3. From *Copper.*—The oxyd of copper imparts to white glaſs the fineſt green colour; but if this metal be not exactly in a ſtate of oxydation it produces a browniſh-red colour. Mountain blue verdigris, and the reſidue of its diſtillation, are the preparations of copper which M. Fontanieu employs to make the artificial emerald.

4. From *Iron.*—Though it is commonly believed that the oxyds of iron communicate a very fine tranſparent red colour to white glaſs, our author could only obtain from it a pale red, a little opaque. The oxyd of iron he employed was in the proportion of the twentieth part of the baſe. There are various ways of preparing the oxyd of iron called crocus Martis, or ſaffron of Mars. In general it is neceſſary that this metal be ſo far oxydated that the magnet ceaſes to attract it. Thus one may uſe the ſcales of iron found upon the bars of furnaces, which ſerve to diſtil aquafortis. By digeſting filings of ſteel with diſtilled vinegar, then evaporating and replacing the vinegar ten or twelve times upon theſe filings, and drying them alternately, an oxyd of iron is obtained, which muſt be ſifted through a ſilk ſieve, and then calcined. The oxyd of iron, thus obtained by the vinegar, our author ſays, only introduced into his baſes a green colour inclining to yellow. By the following proceſs one of the fineſt red colours is obtained: Let an ounce of iron-filings be diſſolved in nitrous acid in a glaſs retort, and diſtilled over a ſand-bath to dryneſs. After having replaced the acid or the dry oxyd, and re-diſtilled it a ſecond and a third time, it is then edulcorated with ſpirits of wine, and afterwards waſhed with diſtilled water.

5. From the *Magnet*—It is neceſſary to calcine the magnet before it be introduced into the vitrifications; having, therefore, torrefied the magnet during two hours, it muſt be waſhed and dried. It is only employed in the compoſition of the common opal.

6. From *Cobalt.*—The oxyd of cobalt is made uſe of for introducing a blue colour into glaſs: but as this metal is rarely free from iron and biſmuth, it is firſt neceſſary to ſeparate them from it; which is done by calcining the cobalt ore in order to diſengage the arſenic; and next diſtilling the oxyd in a retort with ſal ammoniac, when the iron and the

biſmuth are found ſublimed with this ſalt. The diſtillation muſt be repeated with the ſal ammoniac till this ſalt is no longer coloured yellow. The cobalt which remains in the cornute is then calcined in a potſherd, and becomes a very pure oxyd, which being introduced into the baſe, in the proportion of a 900th part, gives it a very fine blue colour; the intenſity of which may be encreaſed at diſcretion by the addition of oxyd of cobalt.

7. From *Tin*.—The oxyd of tin, which is of a white colour, renders opaque the glaſs with which it is melted, and forms white enamel. For this purpoſe calcine the putty of tin; then waſh and dry it, and ſift it through a ſilk ſieve. Take ſix pounds of the ſecond baſe, the ſame quantity of the calcined putty of tin, and forty-eight grains of manganeſe.

8. From *Antimony*. Antimony is only ſuſceptible of vitrification in a certain ſtate of oxydation, and then it produces a reddiſh hyacinth-coloured glaſs; but if the antimony be in a ſtate of abſolute calx, ſuch as the diaphoretic antimony, then it is no longer vitrifiable, and may be ſubſtituted for oxyd of tin, to make white enamel. M. Fontanieu makes uſe of it in the compoſition of artificial topazes.

9. From *Manganeſe*.—Employed in a ſmall quantity, this metallic ſubſtance renders the glaſs whiter; a larger quantity produces a very fine violet colour, and a ſtill larger doſe renders the glaſs black and opaque. There are two ways of preparing manganeſe. The moſt ſimple conſiſts in expoſing it to a red heat, and then quenching it with diſtilled vinegar: it is afterwards dried and powdered, in order to paſs it through a ſilk ſieve. The other method, of preparing the manganeſe proper to furniſh a red colour, is deſcribed by Haudiquer de Blancourt, who calls it "fuſible manganeſe." Take of manganeſe of Piedmont one pound; torrefy and pulverize it; then mix it with a pound of nitre, and calcine the mixture during twenty-four hours; afterwards waſh it repeatedly in warm water, till the water of the leys has no longer any taſte; dry the manganeſe, and mix with it an equal weight of ſal ammoniac; levigate this mixture on a ſlab of porphyry with ſulphuric acid, diluted with water to the ſtrength of vinegar. Dry the mixture, and introduce it into a cornute; diſtil by a graduated fire; and when the ſal ammoniac is ſublimed, weigh it, and add to the mixture an equal quantity. Then diſtil and ſublime as before, and repeat the operation ſix times, being careful at each time to mix the ſal ammoniac and the manganeſe upon the porphyry with diluted ſulphuric acid.

At Turnhault, in Bohemia, a fuſible glaſs is ſold of a yellow colour, very like that of the Brazil topaze: which, when expoſed to a degree of fire in a cupel ſufficient to redden it, becomes of a very fine ruby colour, more or leſs deep, according to the degree of fire to which it has been expoſed. Fontanieu, who aſſayed this glaſs, found it to contain a great deal of lead; but was not able to diſcover any gold in it.

M. Fontanieu obſerves, that there are three *degrees of fire for factitious gems*, very different in their energy. The fire kept up in the wind furnaces in the laboratory of chemiſts, is leſs active than that whoſe effect is accelerated by means of bellows; and a fire ſupported by wood, and kept up during ſixty hours without interruption, produces ſingular effects in vitrification, and renders the glaſs finer and leſs alterable. When recourſe is had to the forge, in order to operate a vitrification, it is neceſſary to turn about the crucible from time to time, that the maſs may melt equally. Some coal alſo ſhould be replaced in proportion as it conſumes towards the nozle of the bellows; for without this precaution we ſhould run the riſk of cooling the crucible oppoſite to the flame, and probably of cracking it. Though this is the readieſt way of melting, it ſhould not be employed out of choice; for the crucible often breaks, or coals get into it, which may reduce the lead to the metallic ſtate. The wind furnace is either ſquare or round. A ſmall cake of baked clay or brick, of the thickneſs of an inch, is placed upon the grate, and upon this cake is placed the crucible, ſurrounded with coals. The degree of heat produced by this furnace is much leſs than that of the forge; but in order to ſucceed in the vitrification, M. Fontanieu recommends the uſe of a furnace deſcribed by Kunkel, of which the interior part is ſo diſpoſed, that we may place crucibles at three different heights; and the name of "chambers" is given to thoſe ſteps on which the crucibles are placed. It is obvious that the degree of heat cannot be equal in theſe three chambers. In the firſt, or loweſt, the heat is greateſt; it is leſs in the ſecond, and ſtill leſs in the third or higheſt. We ſhould begin by placing the crucibles according to their ſize in theſe different chambers; by which means the beſt effect in vitrification is produced. In order to conduct the fire well, only three billets of wood ſhould be put into the furnace at a time for the firſt twenty hours; four billets at a time for the next twenty hours; and ſix billets for the laſt twenty hours; in all ſixty hours. The furnace is then left to cool, care being taken to ſtop the air holes with ſome lute; and in about forty-eight hours after, when the kiln is quite cold, the crucible is to be withdrawn.

Compoſitions.—To make the *white diamond*, take the above fifth, or baſe of Mayence. This baſe is very pure, and has no colour.

This is ſimilar to the beautiful white paſte, ſo generally known by the appellation of "Straſs," which was the name of its inventor.

For the *yellow diamond*.—To an ounce of the fourth baſe add, for colour, 24 grains of horn ſilver, or ten grains of glaſs of antimony.

For the *ſapphire*.—To 24 ounces of the Mayence baſe add, for colour, two drachms, 46 grains of the calx of cobalt.

For the *oriental ruby*.—1. To 16 ounces of the Mayence baſe, add, for colour, a mixture of 2 drachms 48 grains of the precipitate of Caſſius, the ſame quantity of crocus martis prepared in aquafortis, the ſame of golden ſulphur of antimony and of fuſible manganeſe, with the addition of two ounces of rock cryſtal: or, 2. To 20 ounces of the baſe made with flint, add half an ounce of fuſible manganeſe, and two ounces of rock cryſtal.

For the *Balas ruby*.—1. To 16 ounces of the Mayence baſe, add the above colouring powder, but diminiſhed a fourth part: or, 2. To 20 ounces of the baſe made with flints, add the ſame colouring powder, but with a fourth leſs of the manganeſe.

For the *oriental topaze*.—To 24 ounces of the firſt or third baſe, add for colour five drachms of glaſs of antimony.

For the *Brazil topaze*.—To 24 ounces of the ſecond or third baſe, add for colour 1 ounce 24 grains of the glaſs of antimony, and 8 grains of the precipitate of Caſſius.

For the *Saxon topaze*.—To 24 ounces of the firſt or third baſe, add, for colour, ſix drachms of the glaſs of antimony.

For the *hyacinth*.—To 24 ounces of the baſe made with rock cryſtal, add, for colour, 2 drachms 48 grains of glaſs of antimony.

For the *amethyſt*.—To 24 ounces of the Mayence baſe, add, for colour, four drachms of prepared manganeſe and four grains of precipitate of Caſſius.

For the *emerald*.—1. To 15 ounces of either of the baſes, add, for colour, one drachm of mountain blue, and ſix grains of glaſs of antimony; or, 2. To an ounce of the ſecond baſe, add, for colour, 20 grains of glaſs of antimony, and 3 grains of calx of cobalt.

For the *beryl*.—To 24 ounces of the third baſe, add, for colour, 96 grains of glaſs of antimony, and 4 grains of calx of cobalt.

For the *common opal*.—To an ounce of the third baſe add, for colour, ten grains of horn-ſilver, two grains of magnet, and 26 grains of an abſorbent earth.

GEMS. *Engraved gems, engraved ſtones; pierres gravées, gemmes*, Fr.; *gemme, gemme antiche figurate*, Ital.; *geſchnittene ſteine, gemmen*, Germ.; *gemmæ, gemmæ cælatæ*, Lat.; names given to the productions of an art which was held in great eſtimation by the ancients, and has alſo in modern times maintained its rank among the fine arts dependent on deſign. It would be fruitleſs to attempt tracing the hiſtory of the origin of the *Glyptic Art*, (for this is the name which modern writers have given to the art of engraving figures on hard and precious ſtones—the Γλυπτικη of the Greeks,) to thoſe remote periods of which ſcarcely any records remain; but the numerous engraved ſtones ſtill extant enable us, with tolerable exactneſs, to mark the principal eras through which that art has paſſed. Upon the whole, it appears, that its origin is coeval with that of the ſiſter arts, in which the ancients excelled; that, like them, it had its zenith of perfection; was, with them, buried under the ruins of the Roman empire, and revived towards the end of the fifteenth century.

From the moſt ancient records we poſſeſs, the holy ſcriptures, it appears that the glyptic art was practiſed as early as the time of Moſes, who mentions the artiſts that were employed to engrave in onyx the names of the twelve tribes. But from ſome apparently very ancient engraved gems diſcovered in India, with Shanſcrit inſcriptions, Raſpe and others have inferred, that Aſia has a fair claim to the honour of having been in the poſſeſſion of that art even before Egypt: but their mode of reaſoning does not appear altogether concluſive. The mechanical part of the art of engraving was carried to a high pitch of perfection by the Egyptians, but they can ſcarcely be ſaid in any inſtance to have elevated their minds to the conception of ideal beauty. They firſt employed this art for engraving hieroglyphic figures on baſalt and granite, and afterwards extended it to thoſe hard ſtones of which we find moſt of their ſeals and ſcarabæi are formed, ſome of which are of admirable workmanſhip.

The exact period when this art was introduced into Greece cannot eaſily be determined. Pliny ſuppoſes that rings were not known at the time of the Trojan war; but Plutarch is of a contrary opinion, for, according to him, Polygnotes had repreſented Ulyſſes with a ring on one of his fingers. Winkelmann ſuppoſes, that one of the moſt ancient gems of Grecian workmanſhip we know, namely, that on which the dying Othryades is repreſented, dates as far back as the time of Anacreon. The firſt name of any engraver mentioned by the writers of antiquity, is that of Theodorus of Samos, who is ſaid to have engraved, 740 years before Chriſt, that famous emerald which Polycrates threw into the ſea.

The Greeks were the moſt paſſionate lovers of rings and engraved ſtones. Of the Cyrenians it is ſaid, that the moſt parſimonious among the higher claſſes were ſeen to wear rings of the value of ten minæ. They were a moſt eſſential ornament on the fingers of flute players and other muſical performers. In Greece, the art had arrived at the higheſt pitch of perfection at the time of Alexander the Great. It appears, that under the Roman emperors, ſome excellent engravers of gems repaired to Rome, to practiſe their art; but it is uncertain whether they actually introduced it: all we know is, that the Latin tongue had no term to render that of Δακτυλιογλυφες, and that among the many Greek names perpetuated on ancient gems, there are but few that appear to have belonged to Roman artiſts. The glyptic art maintained a tolerable degree of excellence till the time of Septimius Severus, when, together with the other arts, it begun gradually to decay. From Rome it ſpread almoſt over the whole weſt of Europe; but at the time of the laſt emperors nothing remained except the mechanical part: the genius and ſpirit of the art, the correctneſs of deſign and taſte, the nobleneſs of expreſſion, and even many of the practical advantages of which the ancient maſters had availed themſelves for conveying their grand ideas on the ſtone, were all vaniſhed together. But, from the decline of the Roman empire, during the darkneſs of thoſe ages, in which all the arts and ſciences hovered on the very brink of perdition, the mechanical part of the art was ſtill, in ſome meaſure, preſerved, both in Italy and the provinces of the Greek empire. Many gems, eſpecially in relief, called cameos, were manufactured as well for ornamenting holy veſſels, as prayer, and other religious books. Nor was the uſe of ſeals and ſeal-rings altogether diſcontinued. In the royal library at Berlin were preſerved ſeveral litany and pſalm-books of the 9th and following century, richly ornamented with engraved ſtones of the ſame periods, and ſome of them, according to Sulzer, were not without merit. In the ſame manner the author of the "Memorie degli intagliotori moderni," mentions an engraved gem of the fourteenth century, he ſaw at Bologna, which was very well executed (molto ben fatto). From this it would appear, that the art has, in ſome meaſure, maintained itſelf in Italy and Germany, as well as in the provinces of the eaſtern empire; and it was in the former, where, in the fifteenth century, it again roſe to endeavour to reſume its former ſplendour. Giulianelli, the author of the above-mentioned "Memorie," appears to judge right, in obſerving, that the principal cauſe of the revival of the glyptic art in Italy, under the popes Martin V. and Paul II. was the then prevailing taſte for collecting the numerous remains of ancient art; and the engraved gems were naturally the firſt objects that engaged the attention of the lovers of the antique. But with redoubled vigour it began to thrive in the ſecond half of the fifteenth century, under the foſtering care of that great patron of arts and ſciences Lorenzo de' Medici, who not only formed a conſiderable collection of antique gems, but moſt munificently encouraged the artiſts of the time to the imitation of the maſterpieces of antiquity. But that this art was not entirely new at that period, and that it was not Florence in particular where it was reſtored to life, appears from the contemporary productions of Domenichino, a Milaneſe, who, on account of his ſkill in executing raiſed work, was ſurnamed *Da Camei*. When the art of engraving on hard ſtones was thus encouraged, and again cultivated with zeal, by artiſts of genius, it could not fail to make rapid ſtrides towards perfection. Before the conqueſt of Rome, in 1527, a great number of excellent artiſts reſided in that capital, and ſome of them imitated the works of excellent maſters with ſuch ſucceſs, that the greateſt *cognoſcenti* of thoſe times were not unfrequently deceived by them. From this ſecond native land of the arts and ſciences, the art of engraving on ſtones ſpread over other

countries of Europe. Sandrart mentions an engraver of ſtones at Nuremberg, of the name of Engelhard, as a friend of Albert Durer. France owes the introduction of this and all other arts to Francis I. who invited celebrated Italian artiſts to ſettle in that country. Spain had likewiſe ſome Italian maſters in the reign of Philip II.; and England, ever ſince the time of Elizabeth, can boaſt of artiſts, in every reſpect ſuperior to thoſe of the French ſchool.

The ſtudy of *antique* engraved gems has in all times engaged the attention, not only of the antiquary, but of men of ſcience in general, and principally of thoſe artiſts, who conſider taſte and claſſical knowledge as objects not unworthy of obtaining. It is needleſs to expatiate on the importance of which gems are to the hiſtorian and antiquary; ſuffice it to ſay, that the knowledge of a variety of ſigns and ſymbols, of ſubjects of mythology and hiſtory, ſuch as the images of gods, heroes, and celebrated men repreſented on them, cannot be derived from a ſource more authentic and ſatisfactory than they. Even thoſe ruder productions of early periods are intereſting, ſo far as they aſſiſt in tracing the progreſs of the arts dependent on deſign. But by far the greater part of antique gems that have reached modern times, (and indeed their ſuperior durability, and other favourable circumſtances, have fortunately preſerved a great number of maſter-pieces from the ravages of time and barbariſm,) may be conſidered as ſo many models for forming the taſte of the ſtudent of the fine arts, and for ſtoring his mind with correct ideas of what is truly beautiful.

In order to judge with preciſion of the merits of engraved ſtones, not only ſome taſte and acquaintance with the art of deſign are required, but likewiſe a competent knowledge of hiſtory and mythology, and of the hiſtory of the art in general, by which we are, in moſt caſes, enabled to aſcertain, whether a given gem be of Egyptian, Etruſcan, Grecian, or modern origin; nor is it leſs uſeful, for the above purpoſe, to be acquainted with the ſubſtances that have been employed both by ancient and modern engravers. The former of theſe requiſites conſtitute the object of particular ſciences; and with regard to the latter, it will ſuffice to give a ſhort enumeration of thoſe ſubſtances. Before we proceed, it may be proper to obſerve, that ſtones, convex on one ſide, are called *cabochons*, or cut *en cabochon*; *ſcarabæi* are oval engraved ſtones, with the upper ſurface cut in the ſhape of a beetle, or ſcarabæus, of which ſometimes only the engraved baſe is remaining; *grylli*, carricature heads, or heads with diſtorted features, ſo called from an Athenian of the name of Gryllus, famous for his uglineſs; *caprices*, or *ſymplegmata*, are heads grouped together in a fantaſtic manner, ſuch as the head of Meleager joined to that of a wild boar; *chimæras* are imaginary beings, produced by the monſtrous union of the members of ſeveral creatures into one; *joined* (*conjugata*) are heads repreſented together on the ſame profile; and *oppoſite* they are called if they face each other.

The *animal* and *vegetable* ſubſtances on which engravers of gems have exerciſed their ſkill ſcarcely merit to be mentioned in this place; nor did the ancients make uſe of any of the former for this purpoſe, except *ivory*, which they were fond of working (ſee IVORY); but none of the works in it that may be conſidered as cameos have eſcaped deſtruction. Shells have been uſed for engraving gems, but only by modern, eſpecially Italian and Dutch, artiſts: they employed the pearl-oyſter, (mytilus margaritiferus); the thick ſailor-ſhell (nautilus pompilius); ſeveral ſpecies of trochus, cardium, tellina, and cypræa. Of *vegetable* ſubſtances that may have been employed for this purpoſe by the ancients, nothing remains but ſome ſmall pieces of ſycamore wood of Egyptian origin, on which hieroglyphic characters are engraved.

Mineral ſubſtances, from their hardneſs and other uſeful qualities, are more fit for the purpoſes of the engraver; and none more ſo than thoſe belonging to the ſiliceous genus of the earthy claſs of minerals. That aſſemblage of ſtones, however, which is diſtinguiſhed by the name of *precious ſtones*, or *gems* in another ſenſe of the word (ſee the preceding article GEMS,) has ſcarcely ever been employed by the ancients for the purpoſe of engraving upon. Theſe ſcarce and ſplendid ſubſtances were conſidered ſufficiently valuable in themſelves, and the art of engraving was more judiciouſly employed to enhance the value of other leſs expenſive ſtones, which moreover poſſeſſed, in a ſuperior degree, all the properties requiſite for the niceſt execution. Leſſing has proved that what Pliny ſays of the luxury of the ancients, with regard to gems, does not apply, as ſeveral antiquaries have imagined, to engraved, but to precious ſtones, whoſe weight and luſtre they did not chooſe to impair by the engraver's tool; modern artiſts, however, have frequently employed them.

Diamond.—The ancients were ignorant of the art of cutting this gem. They ſet the diamonds in their rough ſtate, preferring thoſe which nature had cut for them in an octohedral form. Theſe, which the French call *à pointes naives*, we ſee in rings and other ancient jewellery prior to the year 1456, when Louis de Berquen invented the art of cutting and poliſhing this precious ſtone (ſee DIAMOND). The four diamonds in the claſp which belonged to the dreſs of Charlemagne, and which was preſerved at St. Denis, were of this deſcription. But it is probable that the ancient engravers made uſe of fragments of diamonds for finiſhing their work. Jacopo da Trezzo appears to have been the firſt who engraved on diamond; but Mariette ſuppoſes that Clement de Biragues executed this taſk in 1564, while others mention Ambroſe Charadoſſa as having, in 1500, engraved the portrait of a father of the church on a diamond, and ſold it for 22,500 crowns to pope Julius II. Natter and Coſtanzi have likewiſe engraved on diamonds; but neither to the advantage of the ſubſtance nor to that of the workmanſhip.

Sapphire and *Ruby*.—(See the article GEMS, *Sapphire*.) Neither of theſe two very hard ſtones has been engraved on by the ancients; and indeed the latter, which they called anthrax, or carbunculus, was ſuppoſed by them to melt the wax. The ſapphire has been mentioned by Raſpe and others as the ſtone on which the beautiful antique head of Julia is engraved, and which is in one of the public collections of Paris: but this is one of the groſs errors ſo common among antiquaries unacquainted with mineralogy; the ſtone in queſtion being nothing but the common beryl or aqua marine, or perhaps only a bluiſh rock-cryſtal. A few modern engravers, however, have employed both ſapphire and ruby. The cabinet of the duke of Orleans poſſeſſed a portrait of Henry IV. executed in ſapphire by the celebrated Coldoré. A German artiſt, Hoefler, has likewiſe exerciſed his ſkill on it.

Topaze.—It has been ſuppoſed, that the ancients did not engrave on this ſtone, which was the chryſolithus of the Greeks and Romans. (See GEMS, *Topaze*.) But Mellin informs us, that the beautiful intaglio, repreſenting an Indian Bacchus, (a gem figured by Buonarroti in his work on the medals of the cabinet Carpegna, and now in the cabinet of antiquities of the imperial library at Paris,) is a topaze; as alſo that the cabinet of the emperor of Ruſſia poſſeſſes

poſſeſſes ſeveral portraits of emperors and empreſſes on the ſame ſtone: but we are not told what kind of topaze they are. Of the works of modern artiſts on topaze, one of the beſt is that repreſenting the heads of Philip II. and Don Carlos, in the juſt mentioned cabinet: this is a whitiſh topaze, which, as the work is that of Trezzo, has for a long time been miſtaken for a diamond.

Emerald.—It appears that the ancients were acquainted with the pure green emerald, which is at preſent only found in the new world (ſee GEM, *Emerald*); but they held it in ſo great eſtimation that it was ſeldom uſed for engraving upon; and Pliny even aſſerts, that, for the above reaſon, it was never applied for that purpoſe; but this writer appears afterwards to contradict his own ſtatement. What we know for certain is, that ſcarcely any well authenticated antique engravings on emerald remain. The moderns have frequently engraved on this precious ſtone, the hardneſs of which does not much exceed that of rock-cryſtal. There is a head of Henry IV. and another of Louis XIV. on emerald, in one of the public collections at Paris. The *beryl*, or *aqua marin*, a variety of the green emerald (ſee GEM, *Beryl*), is well deſcribed by Pliny, but not frequently met with among the remains of ancient art. The muſeum of the imperial library at Paris poſſeſſes a head of Julia, daughter of Titus, engraved by Evodus, on a bluiſh tranſparent ſtone, which is probably a true beryl, though it may turn out to be rock-cryſtal: it is often difficult to diſtinguiſh theſe two ſubſtances when cut and poliſhed; but whatever the one juſt-mentioned may be, the engraving on it is, according to all accounts, a moſt beautiful work of art.

Hyacinth.—The hyacinth is mentioned among the ſtones which the ancients employed for engraving on, but on very uncertain authority; nor is it known what the ancients underſtood by their hyacinth. It was certainly different from ours, for it is deſcribed as of a violet colour, and may therefore be conſidered as mere amethyſt quartz. Modern artiſts have ſometimes engraved on our hyacinth and on jargon, but nothing of any importance is known to be executed in them.

Garnet.—The noble garnet, if we may truſt the accounts we find of engravings ſaid to be in garnet, has been often employed both by modern and ancient artiſts. A firſt rate production of the art, equally celebrated for high relief of the figure, and the ſuperior beauty of the work in general, is the dog Sirius with the name Γαιος on it (though Raſpe ſuſpects Natter to be the real artiſt); it is preſerved in the collection of the duke of Marlborough, and, in the work deſcriptive of that collection, called a garnet. In general the grain of the garnet is not ſuch as to render it a deſirable ſubſtance for engraving upon.

Rock-cryſtal—has been employed by the engravers of all times, both for intaglios and cameos. The coloured varieties have, in general, been preferred, eſpecially the violet, called *amethyſt*, and the browniſh or blackiſh, alſo known by the name of ſmoky topaze. (See ROCK *Cryſtal*). It is not, in all inſtances, eaſy to aſcertain what the ancients meant by *amethyſtus*; but there can be no doubt that all antique violet-coloured engraved gems at preſent extant in the cabinets are nothing but our common amethyſt quartz, alſo called by ſome lapidaries *prime d'amethyſte*, on the erroneous ſuppoſition that it is the matrix of the oriental amethyſt; which latter (being a violet variety of the ſapphire) was, for the reaſons above ſtated, not attempted by the engravers of antiquity.

Of ſemi-tranſparent ſtones belonging to the ſiliceous genus, ſeveral have been employed. The *praſe*, one of the ſubſtances confounded by the ancients with the emerald, is a quartzy ſubſtance of the colour of leek, whence it has obtained its name. (See PRASE.) *Plaſma* and *praſma* of Italian, and other modern lapidaries, are corruptions of *praſe*; as is the word *priſme* and *prime d'emeraude*, which latter corruption has given riſe to the erroneous idea that this ſubſtance is the matrix in which the true emerald is generated.

Chryſopraſe—a tranſlucid ſiliceous ſtone, of apple-green colour (ſee CHRYSOPRASE), which has been confounded both by lapidaries and mineralogiſts with the praſe. It has, for aught we know, been employed by modern engravers only; and, indeed, the true chryſopras has been hitherto found only in Sileſia.

Opal.—The noble opal was too highly eſteemed by the ancients as a precious ſtone to find its way into the hands of the engraver; nor were the common varieties, which do not reflect the vivid colours of the former, uſed for the purpoſe of engraving upon, on account of their ſoftneſs. Of modern productions of the art in opal, a cameo is mentioned repreſenting the portrait of Louis XIII. when a child.

Hydrophane—a variety of the opal, which has likewiſe been mentioned as a ſubſtance on which the ancients uſed to engrave, but this is not very probable, on account of the ſoftneſs of the ſtone, and becauſe the ancients, if they were really acquainted with it, as ſome writers ſuppoſe, muſt have valued it too highly to apply it to that purpoſe. Winkelmann, in his "Deſcription des Pierres gravées du Baron de Stoſch," p. 190, deſcribes a ſtone which he calls a ſardonyx, of three colours, repreſenting Apollo with the lyre: the lower white layer of this ſtone, he ſays, turns quite black, when the ring in which it is ſet is on the finger, but it ſoon recovers its original whiteneſs when not worn. The only way of accounting for this phenomenon, is to ſuppoſe that the white layer neareſt to the finger is a real hydrophane, which, when worn, becomes tranſparent by the moiſture of the finger, and conſequently ſhews the black ſtratum underneath, which makes the white tranſparent layer appear as if it were itſelf of a black colour.

Calcedony and *Carnelian* are, with regard to their ſubſtance, very nearly related, but they differ in colour: that of the former is generally milk and bluiſh white, ſometimes approaching to ſky blue; but it is alſo found of different tints of yellowiſh and reddiſh, when it paſſes into carnelian. The true calcedony is of a greyiſh white-colour, and when poliſhed and held between the eye and the light, always exhibits marks ſimilar to the ſcoopings made with a knife on wood; theſe marks are in the interior of the calcedony, and proceed from the diſtinct mamillary coneretions in which it is originally formed. The ancients obtained their beſt calcedony, by way of Carthage, from the mountains of the country of the Naſamones in Africa, and alſo from Thebes. There are many maſter-pieces of ancient glyptic art in calcedony extant; for inſtance, the celebrated Dyoniſiac bull by Hyllus. The calcedony is generally called *white carnelian* by the lapidaries.

The *carnelian* varies in its colour from deep cherry, and even blood red, to reddiſh white, and paſſes on one ſide into dark brown, and on the other into yellow of ſeveral degrees of intenſity; it has obtained various names according to the tints it exhibits, but all of them are vague and promiſcuouſly applied. A general term for this ſtone with the ancients appears to have been *Sarda*: what they called Indian *morion* is probably the very dark brown variety, forming the baſe of the Nicolo. The pureſt, and moſt tranſparent carnelians are found among the remains of ancient art, and, indeed, moſt of the antique engraved gems we ſee, are ſuperior to any of the modern. Natter, who did not overlook this circumſtance, ſuſpected that the ancients had a particular way of clarifying the leſs pure carnelians, and to give them a brighter and more uniform colour; a ſuſpicion which would have been converted

verted into conviction, had that artiſt known that the art of improving the colour of thoſe ſtones is practiſed at this very day. We have ſeen the yellow variety of little value, which is brought from India as beads and poliſhed pieces, tinged (apparently by a very ſimple proceſs) throughout, and in the moſt permanent manner, with the moſt vivid and uniformly diffuſed cherry red. The Japaneſe are likewiſe ſaid to poſſeſs the art of heightening the colour of carnelians; but, in order to keep up the high price of this article of trade, they, now and then only, throw in a few of the refined among a great number of ordinary carnelians, which they ſend to Europe. Pliny mentions the honey of Corſica as having the quality of clarifying carnelians, if kept in it for ſome time. Though this is undoubtedly fabulous, it appears from it, that in Pliny's time there was a notion of the practicability of ſuch a converſion; and it is probable that the proceſs was known to a few artiſts or lapidaries only. Nor is it improbable that the ancients obtained ſome of their carnelians from parts of Aſia or Africa, with which the intercourſe has ſince been diſcontinued: the diſtinction between *carnelians of the old rock*, and *carneltans of the new rock*, by which names the lapidaries on the continent denote thoſe of ſuperior and ordinary quality, appears to have originated in that belief. The ancients called carnelians of the beſt ſort *male*; and *female* thoſe of a dirty yellowiſh red, in ſhort the carnelians of the new rock of the modern. The Engliſh lapidaries give to the pure cherry-red variety, poſſeſſed of a certain degree of tranſparency, the name of *beryl*; a miſnomer as abſurd, as it is productive of confuſion, eſpecially if deſcribers of gems, as has been the caſe in ſome inſtances, will condeſcend to adopt it.

Carnelian is the ſtone which was moſt commonly employed by the greateſt artiſts of antiquity, and indeed its moderate hardneſs, combined with the exquiſite delicacy of its texture, which makes it ſuſceptible of the fineſt poliſh, will ever ſecure it a diſtinguiſhed rank among the ſtones moſt deſirable to the engraver of gems.

If the calcedony occurs with opaque ſtripes, of a pure white colour, it is, or ſhould be, called *onyx*. This appears to have been the original idea conveyed by the name onyx, which has ſince been given to many agates, jaſp-agates, &c. in which ſeveral ſtripes or zones of different colour are alternating with each other. The white opaque zones, which are wrought into raiſed figures on the ſemi-tranſparent ground, appear, in moſt inſtances, to be *cacholong*, or the reſult of decompoſition: but if ſo, it is difficult to account for the ſharpneſs with which theſe zones are ſeparated from each other, eſpecially in ſuch onyxes where there are two or three regular alternations.

The name of *ſardonyx* is ſtill more vague in its preſent application than that of onyx. Originally it appears to have meant a combination of zones of carnelian (ſarda) with others of calcedony, either freſh or in the ſtate of cacholong, or with both. Indeed, Pliny himſelf had no clear idea of its diſtinctive character; but much more confuſed than his, are the ideas of more modern writers, by whom almoſt every ſemi-pellucid ſtriped pebble is dignified with the appellation of ſardonyx. What lapidaries of the preſent day generally conſider as ſardonyx, are all thoſe calcedonic ſubſtances of a pale reddiſh grey, more or leſs mixed with ſhades of yellowiſh or brown, often intermixed with ſtraight or curved narrow whitiſh ſtripes. If without ſtripes, it may be conſidered as a mere browniſh-red calcedonic maſs, forming, by inſenſible degrees, a paſſage into carnelian.

The ſubſtance called by the Italians *nicolo*, (a corruption of the word onyx, of which *onicuus* was made, and afterwards *nicolo*,) belongs, properly ſpeaking, to the original ſardonyx: it is a zone of deep brown carnelian, appearing black, with a zone of bluiſh calcedony upon it; if this latter is cut away, ſo as to leave only a thin cruſt or film, the figures engraved on it, and even ſuperficial ſtrokes made by the graver, will pierce this delicate cruſt, and appear black, on a bluiſh-white ground; and in the ſame manner a ſlight facet round the margin of the ſtone will produce a black border. Veltheim and others have ſuppoſed theſe nicolos to be artificially compoſed of volcanic glaſs, or obſidian, and calcedony cemented together; but thoſe that we have had opportunities of examining were real productions of nature, reduced into a new form by the lapidary's wheel. The quarries from which this and moſt of the oriental ſardonyxes were obtained appear to be loſt, unleſs we ſuppoſe, with count Veltheim, that the mountains which Cteſias mentions as producing ſardonyx, are thoſe of the weſt coaſt of the peninſula of Hindooſtan.

Both onyx and ſardonyx, and other ſtriped calcedonic ſubſtances, have been employed by ancient and modern artiſts for executing thoſe gems in relief-work, called *cameos*; and it is pleaſing to ſee with what dexterity they have frequently availed themſelves of the different colours of the alternating zones to expreſs the different parts of a figure, ſuch as hair, garments, &c. In this manner, if a white ſemi-tranſparent zone be ſuperincumbent on a zone of carnelian, the red ground will impart a beautiful fleſh colour to the white face; and if the white be between red and brown, or any other colour, the latter may, with excellent effect, be converted into drapery, &c.; as we ſee it done in numerous antique and modern cameos. As celebrated productions of the ancients in this part of the art we mention the apotheoſis of Auguſtus, of two brown and two white layers, being an oval of eleven inches by nine; the apotheoſis of Germanicus, likewiſe of four zones; the celebrated Brunſwick vaſe, repreſenting Ceres in ſearch of Proſerpine; Germanicus and Agrippina in a car drawn by two dragons; Agrippina and her two children; Tiberius; the quarrel of Minerva with Neptune; head of Auguſtus, all of three layers, moſtly brown and white; Jupiter Agiocus, white and black zones, like the following two; Venus on a ſea-horſe, ſurrounded by cupids; a bull: all which maſter-pieces are *now* in the "Bibliotheque Imperiale" at Paris.

Of opaque ſiliceous ſtones, the following are frequently made uſe of by gem engavers; *heliotrope*, or *blood-ſtone*:—deep leek green, generally beſprinkled with blood-red ſpots, which are grains of red jaſper diſſeminated in the green baſe. This latter, according to Werner's opinion, is an intimate combination of calcedony with green earth. Indeed, we have ſpecimens before us which ſhew the gradual mixture of the two ſubſtances in a very diſtinct manner. Blood-ſtone is at preſent much uſed for ſeal ſtones; but alſo the ancients employed it for this purpoſe. It has a fine grain, and is moderately hard; but the grains of red jaſper will ſometimes crumble out when the ſtone is worked. The artiſts who have engraved on this ſtone have availed themſelves with advantage of the red ſpots: thus, among the modern works in blood-ſtone, there was in the royal collection at Paris a buſt of Chriſt under flagellation, in which the drops of blood were repreſented by the ſpots themſelves.

Jaſper.—This ſtone is found of a great variety of colours. (See JASPER.) It is neither ſo hard nor ſo fine-grained as the laſt-mentioned ſubſtances, whence it has not been frequently employed by the great maſters of antiquity. We ſhall mention a few of the varieties of the common jaſper, of which antique gems are known to be extant; the *dark green jaſper* is often ſeen in the form of Egyptian ſcarabæi, ſeldom as flat ſeal ſtones: beſides in Egypt, it is found

found in ſome parts of Italy and France; *yellow* jaſper, on which there are likewiſe found ſome Egyptian engravings; the *red* jaſper which takes a very fine poliſh: Marſyas flayed by Apollo, and other ſubjects, have been frequently repreſented on it. Beſides theſe, we now and then find ſtriped, and even party-coloured jaſpers with intaglios, which ſometimes appear ſo confuſed, that the ſubject of the engraving can ſcarcely be diſtinguiſhed on the ſtone. The difficulty of engraving on this kind of ſtones will ſcarcely be admitted as an apology for preferring them to others better calculated for the purpoſe. Modern engravers have ſometimes employed the Siberian jaſper with beautiful brown and green ſtripes.

Lapis lazuli, or *azure-ſtone*, very well known to yield the beautiful blue colour, called ultramarine. This ſtone is the *ſapphirus* of the ancients, but it is alſo mentioned by them under the name of *cyanus*: it takes a very good poliſh, and when free of pyrites and quartz, which it is ſometimes ſeen to contain in great quantity, is fit for the purpoſe of engraving upon, though its hardneſs is inconſiderable; whence ſcarcely any highly finiſhed work has been executed on it. Bad engravings on lapis lazuli are frequently ſeen.

None but the Egyptians have engraved ſmall objects on compound rocks, ſuch as granite and porphyry; of which we poſſeſs ſcarabæi bearing hieroglyphic figures.

A ſubſtance, which has been employed by ſome ancient, eſpecially Egyptian, engravers, is the *turquois*. This name has been given to foſſil teeth, or other hard bony ſubſtances, which, probably by infiltration of a ſolution of either copper or iron, have received a beautiful ſky-blue colour in the bowels of the earth. It was formerly held in great eſtimation as one of the opaque gems; and a diſtinction was made between the *oriental*, or thoſe of the old rock, and the *occidental*. In this caſe, the epithet of *oriental* is properly applied; for thoſe of the beſt quality certainly come to us from Turkey, Perſia, &c. The occidental are of a greeniſh-blue colour, and are often no true turquoiſes; malachite, and other greeniſh carbonates of copper, and alſo greeniſh-blue feldſpar, called Amazone-ſtone, being ſometimes ſold for turquoiſes. See TURQUOISE.

Of *metallic* ſubſtances that have been employed for gem-engraving, we mention the following:

Malachite, a well-known green carbonate of copper, much uſed for purpoſes of jewellery, but which has in a few inſtances only been tried by modern engravers: it is much too ſoft to be employed. Pliny, who recommended *malachites* for intaglios, muſt have alluded to a ſubſtance different from our malachite.

Magnetic Iron-ſtone, or *Magnet*, has been frequently made uſe of by ancient engravers, eſpecially by thoſe of Egypt and Perſia. The Perſian cylindrical ſeals were not ſeldom made of this metallic ſubſtance.

Hæmatite, another oxyd of iron, has often been uſed for ſcarabæi, and intaglios by the Egyptians: there is, among others, a fine horus on hæmatite in the principal public library at Paris.

Some intaglio and cameo engravings on *inflammable ſubſtances*, ſuch as amber, jet, and cannel-coal, have been executed both by ancient and modern artiſts; but they are of little importance, and the ſubſtances themſelves are ſo ſoft and brittle, that it is enough barely to mention them.

It has been before obſerved, that the honour of the invention, or at leaſt of a prior poſſeſſion of the glyptic art, is ſuppoſed by ſome to be due to India, from whence it is ſaid to have found its way into Egypt. Mr. Raſpe, who is of this opinion, chiefly grounds it on the circumſtance that there are ſeveral engraved gems of conſiderable finiſh, bearing inſcriptions in Shanſcrit, and which muſt, therefore, have been executed at a period much more remote than any of thoſe which produced the works of Egyptian art we are acquainted with. Mr. Raſpe, in ſupport of what he has advanced on this ſubject, refers to the Indian engraving on lapis lazuli belonging to Mr. Townley, which is in the ſtyle of the ancient Indian bas-reliefs found in the grottos of Salſetta and the iſland of Elephanta; as likewiſe to an emerald in the poſſeſſion of Dr. Wilkins, on which a lion is engraved with a Shanſcrit inſcription. But may not the former of theſe engravings be ſuppoſed a modern imitation of the Salſetta and Elephanta ſculptures? and, with regard to the latter, may it not be aſked, how came the ancient artiſt by the ſubſtance on which he engraved, when the part of the world, which alone is ſuppoſed to produce it, was not diſcovered? for that it is not the green variety of ſapphire which is ſometimes called *oriental* emerald, may be inferred from the omiſſion of this epithet in Mr. Raſpe's account of this intereſting gem. Of other Aſiatic remains of the glyptic art, but of a much more modern date than thoſe juſt mentioned are ſuppoſed to be, the Perſepolitan engraved cylinders deſerve to be mentioned in this place: they repreſent long ſlender figures of kings and prieſts, with griffins and various emblems and inſcriptions in Perſepolitan characters. Several of them are figured by Montfaucon, Raſpe, and others; they are of calcedony, magnetic iron-ſtone, jaſper, &c. There are alſo portraits of Parthian kings, with inſcriptions, ſome of which have been explained by Sylveſtre de Sacy; they are on amethyſts and carnelians. But to return to the Egyptian art.

There are far more intaglios to be found among Egyptian gems than cameos, and moſt of them are in the form of ſcarabæi. The figures are generally executed with great care, but the deſign is dry and ſtiff. There is a difference between the Egyptian and the Græco-Egyptian ſtyle, (the latter is eaſily diſcoverable where Egyptian ſubjects are executed by Greek maſters,) and the ſtyle of imitation at the time of Hadrian. The Egyptian ſtones repreſent the divinities of the country, and all the figures of repreſentative, ſymbolical, and hieroglyphic writing, either united or detached. We find among the detached hieroglyphics the eye, and ſeveral figures, the meaning of which is unknown. Among the ſymbolical figures are the perſea, lotus, cynocephalus, the hawk, the crocodile, ſphinx, &c. among the divinities, Iſis, Oſiris, Horus, Anubis, Harpocrates, &c. ſingle or together, often in a bark made of papyrus, and with various attributes, ſuch as the ſiſtrum, the ſcourge, &c. It has been maintained, that the Egyptians never engraved cameos, but this is a miſtaken notion; for though they are very rare, and none of them of high antiquity, yet we muſt conſider as cameos the upper part of the ſcarabæi, which is always relief-work. The Egyptian engraved gems are not very common. Cardinal Borgia poſſeſſed a conſiderable number of them, and ſeveral are preſerved in the Britiſh muſeum.

The ancient inhabitants of ſeveral parts of Africa were in poſſeſſion of the art of engraving, which they had probably received from the Egyptians. The Æthiopians, according to Herodotus, engraved ſeals: the ſtones of the rationale bore the names of tribes. The Mahometan religion does not permit the repreſentation of images; hence, the engraved Arabic and Turkiſh ſtones offer nothing but inſcriptions; we read on them either the name of the proprietor, or a paſſage from the Koran. Millin poſſeſſes, however, the impreſſion of a ſtone, on which the writing is diſpoſed in ſuch a manner, as to form the figure of a man on horſeback. We find alſo pieces of glaſs, with Arabic and Cuphic inſcriptions, which were firſt miſtaken for coin, but

are

are now looked upon as *tesseræ*, for the distribution of money and corn.

The Etruscans appear to have received the mechanical part of engraving on hard stones from the Egyptians; but they practised it before the Greeks: they had, in the manner of the Egyptians, stones cut into scarabæi. But though they received this art from that ancient people, their engraved stones bear a particular character both with regard to the art and the subjects represented. Many stones considered as Etruscan, are of the earliest Greek workmanship; they have but little relief, and the subjects are generally taken from the religious system of Greece. Antiquaries have given, as characteristics of Etruscan style, the granular border which surrounds the engraving, the stiffness of the figures, the form of the letters, the mode of writing, the wings given to those deities which the Greeks represent without wings, and the figures being almost always accompanied by their names. But most of these supposed characters are also found on ancient productions of Grecian art. The principal stones in the oldest style, with inscriptions, are, Atalanta, published in Millin's "Monumens inédits;" Peleus dipping his hair into a water basin, which Winkelmann supposes to represent the river Sperchius, while, according to Heyne, Peleus purifies himself after having slain Actor. Tydeus rubbing his body with a strigilis: this is Visconti's explication, who considers it as a copy of the Apoxyomenos, a beautiful statue of Polycleta, representing a man in that attitude; Winkelmann, on the other hand, supposes Tydeus in the act of drawing a dart out of his foot. Capanæus thunderstruck on the walls of Thebes. Theseus in the prisons of Aidoneus, according to Buonarroti; Lanzi thinks that his attitude expresses his exile to Scyros, a short time before Lycomedes precipitated him from a rock. Perseus, holding in one hand the head of Medusa, and in the other, the sword with which he has cut it off. Achilles putting on his knemides, so often mentioned by Homer. Ajax carrying away the body of Patroclus. Hercules carrying off the tripod. Helena, with wings, as daughter of Nemesis.

The Greek engravers of gems, who, according to Millin, (the first author who has attempted to classify the engravers of antiquity, and whom we follow as the best guide in this part of the present article,) may be supposed to have flourished before the age of Alexander, are, Theodore of Samos, who, as mentioned before, is said to have engraved the famous emerald of Polycrates, and to whom Pliny attributes the invention of the lathe.—Mnesarius, father of Pythagoras; nothing remains of his works.—Heius (HEIOY); we possess of him a Diana Venatrix, dressed in a long robe. The dry manner, the stiffness and incoherence of the lines composing the figure, the border round the engraving, have induced baron Stosch to look upon Heius as a very ancient artist. Winkelmann considers the H as an aspiration. Visconti thinks the name is a trisyllable.—Phrygillus (ΦΡΥΓΥΛΛΟΣ) Cupid issued from an egg.—Thamytus (ΘΑΜΥΤΟΥ); Stosch supposes him to be a contemporary of Dioscorides, and perhaps his pupil: we possess of him a sphynx scratching his ear.

Among the engravers that flourished from the age of Alexander to that of Augustus, are Admon (ΑΔΜωΝ), a Hercules Bibax, formerly in the Verospi cabinet at Rome, from whence it went to the nuncio Molenari's; it is at present in the duke of Malborough's collection. Visconti mentions a beautiful head of a Hercules, with the letters ΑΔ. The letter ω in his name is of a form posterior to the age of Alexander. Raspe mentions a fine gem, representing Vulcan and Achilles, with Admon's name engraved on it, but it is modern, and probably the work of Natter.—Apollonides (ΑΠΟΛΛΩΝΙΔΟΥ): Pliny has quoted him as a great artist. Nothing remains of him except a fragment of a sardonyx, representing a cow lying. (Collect. of the duke of Devonshire.)—Polycletus of Sycion (ΠΟΛΥΚΛΕΙΤΟΥ), disciple of Agelades, one of the most eminent Greek statuaries, about the eighty-seventh olympiad. We have of him a Diomedes carrying off the palladium. This work is not exactly in the style of the age in which it is supposed to have been executed, and perhaps the name of this artist, as Millin conjectures, has been added only to indicate that this engraving is a copy of one of his statues.—Pyrgoteles (ΠΥΡΓΟΤΕΛΗΣ ΕΠΟΙΕΙ). Apelles alone was permitted to paint Alexander; Lysippus to cast his image in bronze; and Pyrgoteles had the privilege to engrave his portrait. We possess, under the name of Pyrgoteles, a head, said to be Alexander's, and another of Phocion; but these names appear to be conjectural. The name of Phocion, indeed, seems to belong to an engraver of a head which was taken for that of the celebrated Athenian; and afterward another hand has added the name of a master still more celebrated, namely, that of Pyrgoteles.—Tryphon (ΤΡΥΦΩΝ), author of the beautiful Cameo, in the Marlborough collection, representing the marriage of Cupid and Psyche. The age of this artist is well ascertained by an epigram of Adeus the poet, who flourished under the kings of Macedonia, successors of Alexander: the subject of the epigram was an intaglio of Tryphon in an oriental beryl.—Chronius (ΧΡΩΝΙΟΥ), Terpsichore standing; a figure which has been since repeated by Onesas and Allion. Pliny, by placing the name of this master between those of Pyrgoteles and Apollonides, has probably followed the chronological order; and this is all by which we may determine the period in which he flourished.

The masters of the age of Augustus are Quintus Alexa (—ΙΝΤΟC ΑΛΕΞΑΣΠΟΙΕΙ). Two legs only are remaining on a fragment, with the name of the artist. Vettori and Bracci have published this stone with the body restored. The Knemides, a kind of half-boots, with which the legs are furnished, has made those antiquaries conjecture that the figure was an Achilles.—Cœmus or Cœnus (ΚΟΙΜΟΥ, ΚΟΙΝΟΥ); we have, with this name, a naked Adonis and a faun celebrating the Bacchanals.—Agathopus (ΑΓΑΘΟΠΟΥC ΕΠΟΙΕΙ). He has engraved the head of an unknown Roman. (See Epitynchanus.)—Aulus (ΑΥΛΟΥ); Stosch has published five gems with this name; Bracci has given twelve, and there are a great number more, the name of Aulus being one of those which the impostors have made particularly free with. Raspe thinks that there are two Aulus; Bracci goes still farther, and acknowledges six different artists of that name. Among the engraved stones bearing the name, those considered as authentic are, a Roman knight running, a quadriga, a head of Diana, one of Æsculapius, a head given by Stosch, as that of Ptolemy Philopater, and by Bracci, as Abdolonymus, in the imperial library at Paris. These five are figured by Stosch. Seven others, added by Bracci, are Venus playing with Cupid, and balancing a wand on her finger; Cupid tied to a trophy; a winged Cupid fettered, digging the ground; the bust of a prancing horse. Visconti is of opinion that the differences of style observable in the works attributed to Aulus are owing to his name having been frequently put on engraved stones that were nothing but copies of his works. Indeed on comparing the Æsculapius of the Museo Strozzi with the other intaglios attributed to him, it is difficult to think that they were executed by the same hand.—Cnejus (ΓΝΑΙΟ); a man come out of the bath holding the strigilis; Diomedes carrying away the palladium; a young Hercules; an unknown head

of particular beauty, ſuppoſed by Bracci to be that of Cleopatra; an athlete rubbing himſelf with oil preparatory to the combat; a beautiful Juno; Lanuvina, or rather, according to Winkelmann, a Theſeus, having his head covered with the ſkin of the bull of Marathon, (or that of the lion, according to Winkelmann,) but the inſcription is ſuppoſed to be by the celebrated Pichler.—Dioſcorides (ΔΙΟΣΚΟΥΡΙΔΗΣ), Apollonides, Chronius, and Dioſcorides are, next to Pyrgoteles, the three moſt celebrated engravers mentioned by Pliny. Dioſcorides was under Auguſtus what Pyrgoteles was under Alexander. Several ſublime works remain of him, of which Stoſch has figured ſeven: two buſts of Auguſtus; an unknown head, ſaid by Baudelot to be the head of Mæcenas, but which Stoſch ſuppoſes to be that of Cicero; Mercury, as god of travellers, with his petaſus, caduceus, and penula (in the collection of lord Holderneſs, according to Winkelmann); Perſeus viewing the head of Meduſa. Bracci has added ſome; ſuch as the head of Io; Mercurius Criophorus, *i. e.* carrying a ram, all works of ſuperior beauty and excellence. The two laſt have been copied by Natter, Pichler, Sirletti, and other celebrated engravers. The name of this artiſt ſhould be written Dioſcorides, ſignifying the ſon of Jupiter. Viſconti does not believe that the Mercury attributed to Dioſcorides is the production of one and the ſame graver; and he conſiders his Io as one of the fineſt engravings in exiſtence. Another beautiful work of this artiſt is Demoſthenes, on an amethyſt, which Bracci and Winkelmann have looked upon as an unknown head. Viſconti has diſcovered the native country of Dioſcorides on an engraving of Eutyches his diſciple, or rather his ſon: it repreſents Minerva with the inſcription ΕΥΤΥΧΗC ΔΙΟCΚΟΥΡΙΔΟΥ ΑΙΓΑΙΘωC ΕΠ (Eutyches Dioſcoridis Ægæi faciebat); from which it appears that he was a native of Ægea, a town of Æolia, in Aſia Minor.—Epityncbanus (ΕΠΙΤΥΓΧΑ); a head of Sextus Pompejus. Gori conſiders this artiſt and Agathopus as manumitted ſervants of Livia, becauſe their names are found among the ſepulchres of the domeſtics of the houſe of Auguſtus: both have there the title "aurifex," goldſmith, whoſe art was often united with that of engraving on gems; but this is only conjectural. Viſconti alſo attributes to Epityncbanus a beautiful carnelian in the poſſeſſion of the Chevalier d'Azara, repreſenting Bellerophon mounted on the Pegaſus, with the inſcription ΕΠΙ.—Eutyches (ΕΥΤΥΧΗC ΔΙΟCΚΟΥΡΙΔΟΥ ΑΙΓΑΙΘωC ΕΠ) ſon or pupil of Dioſcorides, perhaps both.—Oneſidemus. M. Tortoli at Rome poſſeſſes a fine intaglio on ſardonyx, repreſenting Minerva, by this artiſt.—Solon (COΛωN ΕΠΟΙΕΙ; COΛωNOC). It is this engraver who has put his name to a head, ſaid to be that of Mæcenas or Cicero, which, at firſt, on account of the identity of the names, was ſuppoſed to be the portrait of the celebrated legiſlator. It was Baudelot who diſcovered the miſtake. Solon is alſo (among ſeveral other works attributed to him) the author of a fine head of Meduſa.

The engravers poſterior to Auguſtus, if nothing but the ſtyle were taken into conſideration, would with difficulty be ſeparated from thoſe under Auguſtus; but Millin places them accordingly as their works repreſent perſonages that flouriſhed in the particular reigns; thus, as contemporary of Tiberius, we have Ælius (ΑΕΛΙΟC), of whom we poſſeſs the head of that emperor, an excellent engraving, which, however, by ſome is conſidered as the portrait of Cajus Cæſar.

As contemporary with Caligula, Millin introduces Alpheus and Arethon (ΑΛΦΗΟΣ ΣΥΝ ΑΡΕΘΟΝΙ). There are examples of groups of ſtatues being the joint-works of two artiſts; but there are no gems engraved by two maſters, except in the preſent inſtance: one repreſents Germanicus and Agrippina, which Montfaucon, deceived by the ſimilarity of the names, conſidered as portraits of Germanicus and Agrippina, in the character of Alphæus and Arethuſa. The other of their joint production is the portrait of the ſon of Germanicus, the young Caligula. Alphæus has not conſtantly aſſociated himſelf in his works with Arethon: we poſſeſs of him a maſter-piece of the art, *viz.* the triumph of a barbarian king, drawn in a biga, and crowned by victory. Several other gems with the name of Alphæus are quoted; but their authenticity is not proved. Arethon has not left any work executed by himſelf alone.

The moſt eminent engravers of the *time of Titus* are Euodus (ΕΥοΔοC ΕΠοΙΕΙ). There are ſeveral artiſts of this name: the one here mentioned has engraved on a ſtone, which is ſuppoſed an aquamarin, (vide ſupra,) the portrait of Julia, daughter of Titus and Marcia, celebrated for her amours with Domitian. The ſize and beauty of the ſtone, the high finiſh of the work, the reſemblance of the features, and the ſingularity of the coſtume, render this gem very remarkable. It is in the collection of gems of the imperial library at Paris.—Nicander (ΝΙΚΑΝΔΡΟΥ): a head of Julia.

The engravers *of Hadrian's time* are: Antiochus (ΑΝΤΙοΧοΥ) a Minerva Bellatrix. A head, ſuppoſed to be that of Sabina, empreſs of Hadrian, is likewiſe attributed to him: though this may not be the caſe, yet it appears that it is a portrait of Hadrian's time.—Anteros (ΑΝΤΕΡωC), a Hercules buphagus, according to authors. Millin thinks it is a ſlave who carries a large calf for a ſacrifice. It is now in the collection of the duke of Devonſhire.—Hellen (ΕΛΛΗΝ) who has engraved an Antinous as Harpocrates.

Of the engravers of *Marc-Aurel's time* we know;—Aepolianus (ΑΕΡΟLΙΑΝΙ), who has produced a head of Marc-Aurel, which is in the collection of the duke of Devonſhire. M. de la Turbre poſſeſſes a firſt rate intaglio, repreſenting Bacchus intoxicated by the juice of the grape, with the Phrygian cup near him, ſuſpended from a tree. It is by an artiſt of the name of Aepolianus, but not the ſame with the preceding; for, from the letter ΦP added to his name, it would appear that he was a pupil, or ſon, of Phrynicus, or Phronymus: nor is it probable that this beautiful engraving ſhould be the work of the ſame artiſt who put his name in Roman characters on the buſt of Marc-Aurel.

Among the engravers of gems who lived at the *commencement of the decline* of the art, critics have placed a Gauranus Anicetus, who has produced the combat of a dog and a boar; but Millin ſuppoſes that Gauranus is the name of the dog, and that the inſcription ſignifies Gauranus the Invincible.

Artiſts, of whom the *period* in which they flouriſhed *cannot be aſcertained*, are the following:—Aetion (ΑΕΤΙωΝ), who engraved the beautiful head of Priam, in the collection of the duke of Devonſhire.—Agametheros (ΑΓΑΘΗΜΕΡΟC). Stoſch and Bracci have conſidered him as a contemporary of Polycletes. He has produced a fine head of Socrates, which is preſerved in the juſt mentioned collection. The form of the E not being in the manner of the C, renders the inſcription ſuſpicious.—Allion (ΑΛΛΙΩΝΟC and ΑΛΛΙΟΝ). He has engraved a female guitar-player: if this be intended for a muſe, as is the opinion of Bracci, it muſt be a Terpſichore: this will appear from a compariſon between it and the paintings of Herculaneum, and the ſtatues of the muſes, in the Muſeo Pio Clementino, now in the Muſée Napoleon, which are probably copied after the celebrated nine produced by Philiſcus; but as theſe chaſte goddeſſes always appear entirely in full drapery, or with a tunic of a ſingle ſleeve, Stoſch is inclined to take the juſt-mentioned figure of Allion, as alſo that of Chronius, and of Oneſas, for

copies of the ſtatue which repreſented Sparta. There is likewiſe a head of Apollo with the name of Allion. Mariette attributed to this artiſt the famous ſeal of Michael Angelo, but without any good reaſon for doing ſo.—Apollodotus (ΑΠΟΛΛΟ ΔΟΤΟΥ ΛΙΘΟ). The head of Minerva. This is the firſt engraver, as has been ſaid before, who added his profeſſion to his name. This inſcription, by dividing the name into two words, was firſt interpreted "Stone given to Apollo;" but it has ſince been aſcertained that this cannot be the caſe, and that it is the name of the artiſt. To him is alſo attributed a dying Othryades. His ſtyle, ſimple, although not excellent, renders it rather probable that he flouriſhed before the Auguſtan age.—Apollonius (ΑΠΟΛΛΩΝΙΟΥ); a Diana of the mountains (Montium Cuſtos), with a torch in her hand.—Aſpaſius (ΑCΠΑ ΙΟΥ); a head of Minerva. The conformity of the engraver's name with that of Aſpaſia, had, at firſt, induced a belief that this portrait repreſented this famous courteſan. This Minerva appears to be a copy from the buſt of the Minerva of Phidias: but the form of the letter C, together with the ſubſtance the artiſt has employed, namely, a common jaſper, is rather againſt placing him in one of the flouriſhing periods of the Roman empire. There are three engravings of him in the ſame red jaſper.—Athenion (ΑΘΗΝΙΩΝ); Jupiter thundering at two giants; a fine cameo.—Hyllus (ΥΛΛΟΥ), has engraved a beautiful Dionyſiac bull, a young Hercules, the head of a woman with a diadem, and that of an old man, likewiſe with a diadem and a long beard. The ſimilarity of the bull with that of the autonomic medals of Sybaris may place Hyllus before the age of Auguſtus.—Oneſas (ONHCAC), of whom we poſſeſs a Leda, a Muſe, and a Hercules crowned with olive.—Philemon (ΦΙΛΗΜΟΝΟC), has engraved a Theſeus, who, having ſlain the Minotaur, views the body of his enemy proſtrate at the entrance of the labyrinth.—Midius produced a fine (but now unfortunately broken) intaglio, preſerved in the Muſeum of Antiquities at Paris; the fragment repreſents the combat of a griffin and ſerpent.—Mith (MIΘ), perhaps Mithrane, or Mithridate; the head and neck of a horſe. The name is, no doubt, that of the artiſt; for to ſay that the figure repreſents the horſe of Mithridates, and that this gem belonged to his celebrated Dactyliotheca, is conjecturing rather too boldly.—Pamphilus (ΠΑΜΦΙΛΟΥ); his name is on an amethyſt in one of the public collections at Paris; it repreſents Achilles playing on the lyre, a ſubject which has been repeated by the ſame artiſt: one on a carnelian is in the collection of the duke of Devonſhire: an excellent ſculptor, a diſciple of Praxiteles, of the name of Pamphilus, is, by ſome, ſuppoſed to be the ſame who engraved this ſtone; but there is no foundation for this opinion.—Axeochus (ΑΞΕΟΧΟΣ ΕΠ), has engraved a fawn playing on the lyre, near a child holding a thyrſus, with a creſcent between the two figures.—Diphilus (DIPHILI); a vaſe with two maſks above the handle. The circumſtance that a Greek name is written in Roman characters makes Millin doubt the authenticity of this inſcription.—Myrton (MYPTΩN); a Leda.—Nicomachus; a fawn ſitting on a tiger's ſkin: in the collection of the duke of Marlborough: the ſame figure is ſeen on a medal of the family Petronia, and is probably a copy of a ſtatue.—Pergamus (ΠΕΡΓΑΜΟΥ); a young Bacchante.—Plotarchus (ΠΛΩΤΑΡΧΟΣ); Cupid with the lyre mounted on a lion: the manner of this artiſt renders it probable that he lived before Auguſtus.—Scylax (CKΥΛΑΚΟC); the head of an eagle; a Hercules Muſagetes, or conductor of the Muſes. Seleucus (CΕΛΕΥΚ); head of Silenus.—Softhenes (CωCOCN); a beautiful meduſa: Stoſch and Bracci read CωCOKΛЄ, Soſocles; but the inſcription is compoſed only of the above ſix letters, which, according to Millin, ſhould be interpreted CO(ΘЄN; the horizontal line of the Θ and Є frequently wanting in the inſcriptions.—Soſtratus (CωCTPATOΥ); a victory in a biga; a cupid guiding two lioneſſes drawing a car. There are ſeveral other gems with this name; but ſome are counterfeits.—Sotratus (CωTPATOΥ); Meleager preſenting Atalanta with the head of the Calydonian boar. Winkelmann conjectures that this and the preceding name may be the ſame, and the omiſſion of the letter C accidental.—Teucer (TEΥKPOΥ); Jole and Hercules: to judge from the ſtyle of this maſter, he might be placed before the Auguſtan age.—Apelles (ΑΠCΛΛΟΥ); a ſcenic maſk. Bracci has read Apſalus; but, according to Millin, at the period when the C was uſed for the common ſigma, it was not the cuſtom to write ΠC, which two letters were united into Φ. As to the horizontal daſh in Є, it is often either omitted by the engraver, or too ſlightly expreſſed to be viſible.—Carpus (KAPΠΟΥ): he has engraved a Bacchus and Ariadne, and a Hercules and Jole.—Euplus (ЄΥΠΛΟΥ); a cupid mounted on a dolphin. The Greek word, inſtead of being the name of the engraver, ſignifies, perhaps, nothing but "happy voyage."—Euthus (ЄΥΘΟΥ): of this engraver we poſſeſs a Silen ſitting amidſt little Cupids that play on the lyre and double flute. M. Millin has concluded his liſt of the principal engravers of Greece that flouriſhed at periods when they cultivated the art in their own country, and after their ſettlement in Rome, with ſome general obſervations on the Grecian productions of the glyptic art. It would be falling into an error to ſuppoſe all thoſe productions perfect works of art; for though talent was generally diffuſed over Greece, it does not follow that every artiſt of that country muſt have arrived at that pitch of excellence which we admire in many remains of Grecian genius; and, indeed, we poſſeſs ſeveral of their engravings that are even beneath mediocrity. Every one, too, appears to have had his peculiar talent; one artiſt was more ſucceſsful in the drapery, another in the repreſentation of the naked body; one excelled in the art of giving expreſſion and ſtrength, another in giving gracefulneſs to his figures; but the works of the great engravers of Greece, though in different branches of their art, are all ſtamped with a peculiar national character, which is better felt than deſcribed. Sometimes they gave conſiderable depth to their work; at other times we ſee their figures wrought in very ſlight relief, which latter ſtyle of engraving is extremely difficult, and its perfect execution conſtitutes one of the greateſt merits of Dioſcorides. In general, the Greeks applied themſelves more to the intaglio, than to the cameo engraving. They were unacquainted with perſpective, the place of which, however, they ſupplied in ſome meaſure, by the greater or leſs depth they gave to the different parts. They did not multiply their figures, or crowd them into a ſmall ſpace. They were ſkilful in repreſenting animals; they preferred to draw the naked body, and, indeed, moſt of the maſter-pieces of art produced in Greece are figures without drapery; while thoſe executed at Rome are generally richly decked with drapery; with the exception, however, of thoſe of Dioſcorides, who followed the taſte of his own nation in this reſpect, for all his figures, if we except his Mercury, are naked.

The engraved gems of Roman artiſts are, in general, very far from meriting the praiſe which we ſo willingly beſtow on thoſe of the Greeks; their figures, indeed, ſeldom treſpaſs againſt the rules of deſign; but they are deficient in elegance; they ſeldom beſpeak either genius or elevation of mind in the artiſt. The taſte for engraved ſtones was introduced into Rome with that for other monuments of art; it

maintained

maintained itſelf till the time of Septimius Severus, when it began gradually to decline. We ſtill find many heads of Antonius Pius, of Marc-Aurel, or Lucius Verus, but thoſe of Gordianus, Maximinus, and of Philip are very ſcarce. Lippert, however, mentions a pretty good head of Valerius Probus, and one of Conſtantine II.

Millin claſſes among the Roman artiſts, or at leaſt thoſe that were ſtrangers to Greece, all whoſe names appear to him not of Greek origin, or are written in Latin: the liſt is not a very conſiderable one.

Aquilas (AKYIAAC); Venus bathing; Cupid preſents a mirror to her.—Felix (KAAΠOYPNIOY CEOYEPOY ΦHAIΞ EΠOIEI); Diomedes carrying off the palladium. Felix was probably a manumitted ſervant of Calpurnius Severus. —Quintillus (KVINTIA.) has given a Neptune on a beryl, or aquamarin.—Rufus (POYΦOY, POYΦOC EΠOIEI); a figure of Ptolemy VIII. or Lathyrus; Aurora driving in a quadriga, and holding a torch in her right hand. The ſame ſubject is repreſented on a medal of the family Plautia, with a maſk on the reverſe, in memory of Plautus Rufus, who recalled to Rome the flute players that had withdrawn to Tibur. A great number of gems, with Roman names, are mentioned; but they are probably the names of the proprietors, not thoſe of the engravers of the ſtones.

The celebrated dog Sirius, attributed to Cajus (ΓAIOC) in the collection of the duke of Marlborough, is generally quoted as the work of a Roman artiſt; but Raſpe is of opinion, that the name is fictitious, and that this valuable gem is the work of Natter, who executed it at Florence, for Baron Stoſch. If ſo, this is one of the moſt remarkable inſtances of reſignation.

It has been aſſerted, that the engraver of the head of Marc-Aurel is the laſt who has added his name to his works; but, to judge from the execution, the form of the letters, the orthography, thoſe who have written their names on the following ſtones, have, according to M. Millin, probably flouriſhed in the Lower Empire.—Of Chæremon (XAIPHMΩN) we poſſeſs the head of a fawn.—Phocas (ΦOKAC); a pugiliſt with a veſſel at a diſtance.—Nicephorus (NIKHΦOPOC); a Mercury, with his uſual attributes, and carrying on his right hand the eagle of Jupiter. One of the more remarkable works of this period, is the ſtone called the *ſapphire of Conſtance,* which formerly belonged to the muſeum of France, and was not long ſince in the collection of the marquis Fulci-Rimiccini at Florence: it repreſents the emperor Conſtance attacking a wild boar, near Cæſarea, in Cappadocia.—Amphoterus (AMΦOTEPOY): we have of him a head ſaid to be that of Rhoemetalces, king of Thrace, but the ſuppoſed reſemblance has not been proved.—Ammonius (AMMONIOY); a head of a fawn, an excellent engraving.

Of the ſcanty production of art, during the middle ages, ſeveral Greek works have been preſerved, repreſenting various ſubjects of the Old and New Teſtament, with long Greek inſcriptions: ſuch is the ſardonyx publiſhed by Gori as a frontiſpiece to his "Theſaurus veterum Dyptichorum." Several gems of this time are diſtinguiſhed for the ſize of the onyx in which they are engraved. We find, particularly in the Eaſt, at Conſtantinople, engravings very near the period of the greateſt barbariſm; an advantage it owed to the art of coining, which could not be practiſed without the aſſiſtance of that of engraving. But in the Weſt, the latter diſappeared at an early period, ſo that ſcarcely a trace of it remained. The Chriſtian religion having ſpread all over Europe, the ancient engraved ſtones were no longer ſought after, as repreſenting objects of worſhip; they were only occaſionally uſed as ſeals. Pepin ſealed with an Indian Bacchus; Charlemagne with a Serapis. Soon after their uſe for ſealing was diſcontinued; they were no longer ſet in rings, they diſappeared, were diſperſed, buried; they were employed for ornamenting the ſhrines in the churches, and it was in this manner that many of the highly valuable antique gems were preſerved to poſterity.

The engravings on ſtone, of thoſe times, offer ſcarcely any thing except pious ſubjects, images of Chriſt, or the Virgin, or ſimply their monograms. Sometimes we ſee on them a ſmall fiſh, called in the Greek language, IXΘYΣ, a word, the letters of which become the initials of Ιησους Χριστος Θεου υιος; often they repreſented the good ſhepherd, and other ſubjects of the Old and New Teſtaments.

The moſt celebrated engraved ſtones among the intaglios, with the names of the artiſts enumerated in the preceding part of this article are, the Io, the Demoſthenes, the Perſeus and Mercury of Dioſcorides, the bull of Hyllus, the Hercules of Onejus, the Meduſa of Solon, the Julia of Evodus, &c. One of the moſt famous of thoſe that are without the names of the artiſts, is the ſeal of Michael Angelo, a carnelian preſerved in the Imperial library at Paris, and thus called from having belonged to that celebrated painter. It ſimply repreſents a vintage, but has been the ſubject of much conjecture, and many diſſertations have been written on it. Mautour diſcovers in it ſacrifical rites in honour of the birth of Bacchus; according to Tournemine, it is Alexander repreſented as Bacchus, and the whole relates to the conqueſt of India; but, according to Roſman, it is the birth and education of Alexander. Baudelot and Thierheim conſider it as a repreſentation of an Athenian religious proceſſion. Mariette ſees nothing in it but a vintage, and the little fiſherman in the exergue, according to him, is intended to expreſs the name Allion, the engraver. Von Murr however, has proved that it is the work of Maria di Peſcia, a celebrated modern artiſt and friend of Michael Angelo, and that the figure of the little fiſherman in the exergue alludes to his own name. This ſtone has been often copied, and there are a great number of impreſſions from it. Other diſtinguiſhed intaglios are, a young Hercules, and a Hercules veiled like a Lydian woman, both in one of the public collections of Paris, five chiefs before Thebes, &c. &c. Among the gems in relievo called cameos the moſt remarkable are, the ſardonyx of Tiberius, and the ſardonyx that formerly belonged to the emperor of Auſtria; with ſome others mentioned above. Beſides theſe large cameos, there are in ſome cabinets moſt valuable ſpecimens of thoſe cups called *gemmæ potoriæ* by the Romans. They are generally of ſardonyx. The moſt celebrated are the ſuperb cup repreſenting the myſteries of Ceres and Bacchus given by Charles III. to St. Denis, and now in the collection of antiquities of Paris; the Brunſwick vaſe of ſardonyx, ſo often deſcribed, which repreſents the hiſtory of Ceres in ſearch of Proſerpine, and that of Triptolemus, and which originally belonged to the family Gonzaga, but was ſtolen at the ſacking of Mantua in 1630 by a ſoldier, who ſold it for 100 ducats to the duke of Brunſwick; this wonderful work of art is now likewiſe at Paris. But the moſt ſuperb of all the engraved vaſes is the Portland, or Barberini vaſe, which was firſt in the collection of the Barberinis, from whence it came into the poſſeſſion of the duke of Portland, and is now depoſited in the Britiſh Muſeum. One of the firſt Italian engravers of the fifteenth century was Giovanni delle Cargniole, whoſe reputation as an engraver of intaglios procured him this name; we poſſeſs of him, among others, the portrait of Savanarole.—Dominichino, ſurnamed de' Camree, becauſe he excelled in the execution of raiſed work, has engraved the portrait of Luigi Sforza.—Michelino, Marco de Benedetti, Marco, Attio, Moretti, Franceſco Francia, Leonarde di Milano, and Severo di Ravenna, likewiſe ac-

quired great celebrity as artiſts. Tagliacarne probably took this name on account of his ſkill in engraving carnelians.—Foppa ſurnamed Caradoſſe.

The liſt of the Italian engravers of the fifteenth century is much more numerous; this is the moſt flouriſhing period of modern glyptic art, and indeed that century produced ſeveral worthy of the ancient maſters to whom they looked as their models. The principal among them are, Pietro-Maria di Peſcia, in Tuſcany, a zealous admirer of the ancients, and their faithful imitator. This is the artiſt whom Von Murr believes to have executed the celebrated ſeal of Michael Angelo.—Giovanni Bernardi and Caſtel Bologneſe; the latter has engraved many cryſtal cups and ſtones for cardinal Farneſe; he died in 1557. Of him we poſſeſs a beautiful engraving repreſenting Tityus, whoſe liver is devoured by a vulture, executed after a deſign of Michael Angelo for cardinal Hippolito de' Medici. M. Collet owns a magnificent cameo, the work of this great artiſt, which repreſents the head of St. John decapitated.—Matteo del Naſſaro born at Verone, follows Francis I. into France where he diffuſed the taſte for his art. The Muſeum Napoleon, and the Cabinet of Antiquities of the library at Paris, poſſeſs ſeveral of his works. One among them repreſents a battle, and on one of the colours we ſee the letters O. P. N. S. (Opus Naſſarii Sculptoris). He died in 1547.—Giovanni Giacopo Caraglio of Verona, engraver of ſtones, medals, and of copper plates.—Valerio Vicenlino, called by ſome Valerio Belli. Mariette, (Traité, p. 46.) has publiſhed his portrait. This is one of the moſt capital and laborious artiſts in his department. He has engraved various ſubjects taken from Roman hiſtory; he died in 1546.—Aleſſandro Ceſari, ſurnamed Il Greco, on account of his imitating the ſtyle of the great maſters of Greece. We have of him a beautiful portrait of Henry II. king of France.—Giacopo da Trezzo, to whom the firſt engraving on diaomnd is attributed. The cabinet of Antiquities at Paris poſſeſſes of this maſter the portraits of Philip II. and Don Carlos on a Brazil topaze. He died in 1587.—Clemente di Birague, who is likewiſe ſaid to have executed engravings on diamond.—Annibale Fontana, known by ſeveral works on rock cryſtal.—Santa Croce, called Pippo, originally a ſimple ſhepherd, who engraved on cherry ſtones the moſt delicate bas-reliefs. Filippo Doria, who met with him in the duchy of Urbino, placed him under proper tuition, and aſſiſted him in ſettling at Genoa.—Antonio Dordoni; died at Rome in 1584;—and Flaminio Natalis, in 1596.

The art of engraving, ſo flouriſhing in Italy in the ſixteenth, loſt much of its ſplendour in the ſeventeenth century; nay, it was ſo little cultivated, that ſeveral proceedings and mechanical advantages were entirely loſt, ſo that the celebrated artiſts of the eighteenth century were obliged to invent others. The moſt diſtinguiſhed Italian engraver of ſtones in the ſeventeenth century is Andrea, ſurnamed Il Borgognone; he engraved about the year 1670. The others are Adoni Taddeo, Caſtrucci, Antonio Mochi, Juliano Pericioli, and a few more. For the conſervation of the art in that century, we are principally indebted to Ferdinand II., who continued and added to the penſions given to the artiſts then engaged to work in the gallery of Florence.

The eighteenth century has given artiſts to Italy, whoſe names are worthy to be mentioned together with the Pyrgoteles, Solon, Aulus and Dioſcorides. Moſt of them were ſettled at Florence.—Flaviano Sirletti, who died in 1737, has copied ſeveral greek works. He excelled in the imitation of ancient letters: his works are marked Φ. Τ. Σ. ΦΛΑΒΙΟΥ ΤΟΥ ΣΙΡΛΕΤΟΥ. Others worthy to be mentioned are the Coſtangis, Giovanni, Tomaſo, and Carlo his ſon; Domenico Landi; Franceſco Ghinghi; Jeronimo Roſſi; Stefano Paſſalia; Franceſco Borghighiani; Felice Barnabes, the Torricellis; Lorenzo Maſini. Thoſe gem engravers who at preſent cultivate their art with greateſt ſucceſs, are Sign. Santarelli, Maſſini, and Capperoni; at Naples, Sign. Rega, an artiſt, ſome of whoſe productions may be compared with thoſe of antiquity. There is alſo a female artiſt of note in that city, Signora Talani of Rome.

The German engravers of gems have always maintained the firſt rank after thoſe of Italy. The oldeſt German engraver on ſtones is Daniel Engelhard of Nuremberg, who died in 1552; he is, however, not known to have executed more than arms and creſts.—Chriſtopher Schwaiger has been called the German Pyrgoteles, but none of his engravings are aſcertained. There is a portrait of him with the year 1620 on it.—George Hoefler; he died in 1630.—Eberhard Dorſch, who died 1732: Raſpe thinks the greateſt part of the pretended antique gems that were in the cabinet of Mr. Ebermeier at Nuremberg are by Dorſch.—Philip Chriſtoph. de Beiker, died in 1743: an artiſt of great merit, as is proved by his buſt of Charles VI., and other engravings.—Marc Tuſcher, a good painter, but of whoſe engravings on ſtones Mariette is far from ſpeaking favorably. The fact is, Tuſcher exerciſed that art merely as an amateur.—Anton Pichler, the father of the celebrated John Pichler; he was a native of Brixen in Tyrol, and has produced ſome engravings of merit.—John Pichler, who is claſſed by Millin with the Italian ſchool of engravers, becauſe he ſpent a great part of his life, and is ſaid to have formed his taſte in Italy, is unqueſtionably one of the greateſt glyptic artiſts of modern times. He has produced a great number of excellent engravings, ſeveral of which may be compared with the more celebrated productions of ancient arts.—Lorenz Natter, a native of Suabia; his numerous works beſpeak a refined taſte, and are executed with the greateſt delicacy and correctneſs in the deſign. He was, at the ſame time, a great proficient in the theory of his art, and his "Traité de la Méthode Antique de Graver en Pierres Fine," is the only work we poſſeſs on this intereſting ſubject. He died in 1763.—Krafft from Dantzick, a good engraver, ſettled in Rome at the time of Mariette, who calls him Graaft, and ſays that the difficulty of pronouncing his name occaſioned his being called "il Tedeſco" by the Italians; but Raſpe obſerves that it is, or was, a general cuſtom among Italian artiſts, to call each other by their chriſtian names, or by the name of their country. He was a pupil of Natter. Other modern German engravers are Hubner of Dreſden; Lerter, and Aaron Wolf; the laſt-mentioned artiſt, a native of Brandenburg, is of the Jewiſh perſuaſion, and ſettled at Leghorn; we have of him a Leda which has rendered his name celebrated.

Among the Engliſh engravers of gems, eſpecially thoſe of more modern times, there are ſeveral who have acquired great reputation by their works, ſuch as Dean, Wray, &c. and a Burch and a Marchant have attained to a degree of excellence which would have been acknowledged and reſpected in the beſt periods of ancient art. In general, however, the number of good engravers on ſtones has not been very great in this country.

The firſt, and perhaps the only engraver of ſome note in France, after Matteo de Naſſaro had in the time of Francis I. introduced into that country the taſte for the glyptic art, was Coldoré, who lived at the end of the ſixteenth century, till the reign of Louis XIII. Whole figures are not known to be engraved by this artiſt; but his heads are remarkable for their elegance, the firmneſs with which they are executed, and their perfect reſemblance to the originals. It is ſaid, that

queen

queen Elizabeth invited him to ſettle in England; there was a beautiful cameo repreſenting this queen, in the cabinet of the duke of Orleans, which Mariette thinks can be the work of no other artiſt but Coldoré. The ſame author is of opinion, that Julien de Fontenay and Coldoré were no rivals, as it has been ſuppoſed, but one and the ſame perſon under different names.—Maurice, a native of the Netherlands, and a good engraver, ſettled at Rouen, where he died in 1732, aged 80.—François Julien Barrier, died 1746.—Louis Siries, who was employed in the gallery at Florence. His merit conſiſted in crowding a great number of figures into a ſmall ſpace. Giulianelli is very high in his praiſe; but Natter conſiders his engravings as devoid of all merit.—Jacques Guay of Marſeilles, has ſucceſsfully practiſed the art: there are, in the cabinet of antiquities in Paris, a ſeries of engravings executed by him for Louis XV.—France, which at no time excelled in the number of good gem engravers has, ever ſince Guay's time, been particularly deficient in this claſs of artiſts, ſo that Millin (in 1797) conſidered the glyptic art as abſolutely extinct in his country. There is, however, at the preſent day, a ſkilful engraver in Paris of the name of Jeuffroy, whom the national inſtitute has thought worthy to receive among its members.

Thoſe antique engraved ſtones, that bear the name of the artiſt, having at all times been looked upon as particularly intereſting and valuable, ſeveral perſons have fraudulently availed themſelves of this circumſtance to add the name of ſome celebrated engraver of antiquity to works both of ancient and modern art; and ſome of them have ſucceeded ſo well, that often much critical acumen is required to detect the deception. Natter himſelf is accuſed of having lent himſelf to this ſpecies of fraud in compliance with the commands of his employers. The artifice of thus putting the name of ſome celebrated artiſt to an engraving, is, however, not peculiar to modern times; it was already practiſed at the time of Phædrus, who complains of it in one of his fables. We ſhould not, therefore, conſider ancient names on gems as genuine, before the ſevereſt criticiſm has proved them to be ſo. The following rules may aſſiſt in diſcovering their authenticity. The beauty of the work ſhould be proportionate to the talent of the artiſt to whom it is attributed: a middling engraving, though it bears the names of Pyrgoteles, Cnejus, Solon, Aulus, or Dioſcorides, cannot reaſonably be attributed to any one of thoſe great maſters. The great ancient artiſts have in general engraved on the finer kind of ſtones; hence the name of Dioſcorides on a common jaſper muſt excite ſome doubt as to the authenticity of the name; there is, however, by way of exception, a very beautiful work of Aſpaſius in red jaſper. The form of the letters is likewiſe of great utility in diſtinguiſhing truth from impoſition. Thoſe of the early ages are leſs perfect than thoſe of the engravers of the Auguſtan age, which are elegant and highly finiſhed; whence the name of *Dioſcorides*, written in an unequal manner, can ſcarcely be the work of this great maſter; for the celebrated artiſts, jealous of their reputation, even with regard to the minutiæ of their art, did not truſt others with the execution of the letters. The inſcriptions on engraved ſtones, particularly thoſe of the Auguſtan age, are generally terminated by ſmall round dots, very equal in their proportions, intervals, and depth. Peireſcius was of opinion that they might have been intended for the reception of minute pins, for the ſake of faſtening the gold, with which he ſuppoſed the hollow characters were filled up; but nothing proves that theſe inſcriptions were intended to be filled up with a metal: they are cut in the ſtone in order to expreſs in reliévo the name, together with the image. At the preſent day moſt antiquaries agree in ſuppoſing theſe dots to have been deſtined to mark the diſtances of the letters, and to give greater regularity to them, juſt as we obſerve ruled lines in old manuſcripts. In the ſame manner medals have the letters of the inſcription terminated by round dots; and, from the frequency with which they occur on them, it is probable that what was firſt calculated to produce uniformity, was afterwards adopted as ornament. The form of the letters may likewiſe ſerve to diſcover fraud. The mixture of Greek with Latin letters is an evident ſign of forgery. The ſame may be ſaid of a letter expreſſed in two different ways in the ſame word; for inſtance, the ſigma written as C, and as Σ in the word COΣTPATOC. Such errors are commonly committed by modern artiſts, who undertake to add the names of ancient maſters to their works; they are generally indifferent grammarians, and, therefore, liable to commit errors, which no artiſt of antiquity could have fallen into. Thus deceived by the prnounciation of the name, they have written ΔIOCKOPIΔOY inſtead of ΔIOCKOYPIΔOY; they add a letter in one name, and omit one in another. If an artiſt is known to have been accuſtomed to add his name in the genitive caſe, as it was done by Dioſcorides, an engraved ſtone, on which the ſame occurs in the nominative caſe, muſt always excite ſuſpicion. In general the names expreſſed in the nominative caſe are rare. If we read AYΛOY, ΔIOCKOYPIΔOY, ΠAMΦIAOY, the word ἔργον is to be ſupplied, *i. e.* the work of Aulus, Dioſcorides, &c. If the name be in the nominative caſe, it is the verb which is omitted, whence ΔIOCKOYPIΔHC implies the word ἐποιει, Dioſcorides faciebat. Where two names occur in the ſame caſe, the one is the name, and the other the ſurname; but where the firſt name is put in the genitive and the ſecond in the nominative caſe, this indicates that the artiſt was the ſon, the pupil, or the freed ſervant of him whoſe name is put in the genitive caſe. Thus, EYTYXHC ΔIOCKOYPIΔOY ſignifies either that Eutyches was the ſon or pupil of Dioſcorides, or perhaps both the one and the other. But in the inſcription on a ſtone repreſenting Diomedes carrying off the palladium, KAΛΠOYPNIOY CEOYHPOY ΦHAIΞ EΠOIEI, (Calpurnii Severi Felix faciebat,) it is very probable that this Felix was the manumitted ſervant of Calpurnius Severus, and though theſe names are Roman, yet as he makes uſe of Greek letters, he likewiſe adopts the form of the Greek ſtyle. An engraving on a ſtone is ſometimes the joint work of two artiſts. Alphæus and Arethon have produced a gem with the inſcription AΛΦHΩC CYN APEΘΩNI (Alphæus with Arethon). We have but one ſingle inſtance of an engraver who with his name has indicated his profeſſion on the gem, and this is Apollodotus; by the ſide of the head of Minerva we read AΠOΛΛOΔΩT. ΛIΘO, (Απολλοδοτε λιθογλυφε sc. ἐργον,) or the work of Apollodotus the engraver). The greateſt part of the names of engravers are Greek. In one inſtance, perhaps, the artiſt has added the name of his native country; for on a ſtone repreſenting the cap of Caſtor between two ſtars, we read AΠOΛ ΣMYP, which is explained Apollonides of Smirna; but it is probable that this engraving is votive, and that, inſtead of the name of the artiſt, it bears that of the navigator, who hoped by this taliſman to obtain a fortunate voyage from the ſons of Leda.

The names of Roman engravers are, for the greateſt part, written in Greek letters, while there are very few inſtances of Greek names being written in Latin characters; and even theſe few inſtances cannot be conſidered as of great authority. In general it may be ſaid that the Etruſcan gems bear the name of the perſonages repreſented on them; for inſtance, thoſe on which are cut the names of Peleus, Tideus, the five Theban chiefs, &c. The engraved ſtones of the Greeks, on the other hand, bear the name of the artiſt, and

thoſe of the Romans ſometimes the name of the engraver, ſometimes that of the owner. This cuſtom, of adding the name of the poſſeſſor, has been preſerved in more modern times, particularly in the cinque cento, the ſixteenth century; witneſs the many antique gems with the inſcription LAUR. MED. (Lorenzo de' Medici) which Maffei has in vain endeavoured to explain. Not ſeldom the names of modern engravers are written in Greek characters, ſuch as Φ. Τ. Σ. ſignifying Φλαβιυς τυ Σιρλετυ, or Flavio Sirleti; ΠΙΧΛΗΡ, Pichler, &c. Thoſe amateurs only, that are unacquainted with the Greek alphabet, are liable to be deceived by this practice. Other artiſts have concealed their name, a kind of literal tranſlation of its import; Winkelmann and Büſchiny have taken the word ΥΔΡΟC (Hydros,) for the name of a Greek engraver, while it is nothing but a tranſlation of *Natter*, which German word ſignifies a viper, called hydros by the Greeks. We may alſo, in ſome meaſure, determine the period in which the engraver of a particular gem lived, by finding out the time when his name was moſt common: thus, for inſtance, the name of Zoſimus, more common in the Lower Empire than in any other period, will, with ſome probability, indicate that period to be the date of the work in queſtion. Some engravers, undoubtedly very well known at the time when they flouriſhed, have put nothing but the initials of their names, which neceſſarily muſt be filled up in an arbitrary manner; and this difficulty increaſes, if the name ſignifies at the ſame time the object repreſented, and therefore leaves us doubtful whether we are to apply it to the object, or to the artiſt. Thus the letters HERM, on a carnelian repreſenting Mercury, may be intended for Hermes, or for the name of an artiſt ſuch as Hermotime, Hermolaus, &c. The modern engravers that have been moſt ſucceſsful in copying the names of ancient artiſts, are Flavian Sirleti, Natter, and Pichler.

The *mechanical part* of the *art of engraving gems*, ſuch as it was practiſed by the ancients, differed in no reſpect from the method which is followed by the engravers of the preſent day; for, according to the opinion of a competent judge in theſe matters, the celebrated Natter, (the reſults of whoſe reſearches are publiſhed in a treatiſe entitled "De la Méthode Antique de Graver en Pierres fines, comparée avec la Méthode Moderne)," their tools were not only analogous to thoſe of modern artiſts, but they uſed them exactly under the ſame circumſtances. It is not our intention to follow the juſt-mentioned ingenious artiſt in the analyſis he has given of a number of antique engravings, but we ſhall copy one of the heads repreſented in the above work, together with an outline drawing of the ſame head, which exemplifies the mode of proceeding employed by the engraver of ſtones. Theſe figures, together with thoſe repreſenting the lathe and tools uſed by the gem engraver, will ſuperſede a more detailed deſcription than the one which we are enabled to give in this place.

The firſt operation of the engraver is to give to the ſtone that is to be employed a form ſuitable to the ſubject he intends to repreſent on it. This is generally performed by the lapidary. (See LAPIDARY.) He next draws the outline of the ſubject with a braſs needle, or a diamond, on the poliſhed ſtone, which is cemented by means of maſtich to a handle of wood for the purpoſe of moving it more commodiouſly in all directions.

Fig. 1. (*Plate* XVIII. *Miſcellany*) repreſents the whole of the lathe; it conſiſts, as the figure ſhews, of a table, on which is fixed the mill, or a ſmall horizontal cylinder of ſteel, at one of whoſe extremities the tool is inſerted, and which is turned by means of a vertical wheel below, communicating with the horizontal cylinder by means of a cord, and ſet in motion by the foot of the artiſt. Sometimes the whole of the mill on that ſide, except that part of the cylinder to which the tools are fixed, is covered by a cap; but this is not always made uſe of.

The tools that are alternately fixed to the extremity of the mill, are,

Fig. 2. a hollow cylinder made uſe of to deſcribe circles with facility, and alſo for perforating.

Fig. 3. is the knobbed tool, called *bouterolle* by the French; it is employed in various kinds of work; for extremities, &c.

Fig. 4. a tool, the upper part of which is in the form of a ſmall diſk rounded at the edge: it is uſed for various purpoſes.

Fig. 5. a ſimilar tool, but with diſks not rounded at the the edge.

Fig. 6. the ſame, but with the edge of the ſmall diſk, ſharpened for the purpoſe of cutting into the ſtone: it is called in French *ſcie* (ſaw).

The ſize of theſe tools varies from the bigneſs of a large pea, to that of a point ſcarcely viſible to the naked eye.

It is obvious that theſe tools may be varied in their form, according to the fancy of the engraver; but thoſe juſt deſcribed are moſt generally made uſe of.

When the tool is fixed in the manner above deſcribed, and repreſented in the figure, the artiſt applies to its point diamond-powder, mixed up with olive oil; he then turns the lathe, and begins his work, by bringing the ſtone faſtened to a piece of wood, into contact with the tool which turns round its axis with conſiderable velocity.

Fig. 7. repreſents a ſtone of convex ſurface, with a tool applied to it; it ſhews the advantage of working on ſtones of that form; for the ſpace between the ſtone and the tool being more conſiderable in a convex than in a plane ſtone, the tool penetrates farther on the former than it would on the latter. This may be ſeen by fig. 8, where the ſame tool touches much nearer the borders of the flat ſtone.

Fig. 9. The ſtone applied diagonally to the tool produces what the Italians call *ſotto quadro*; engravings made in this manner cannot give a good impreſſion.

There are ſome figures which are with difficulty executed on ſtone, although they appear eaſy; and others that appear difficult, although they are far from being ſo. Thus, for inſtance, figs. 10, 11, 12, repreſent different angles, which it is no eaſy matter to execute with nicety; we generally obſerve imperfect execution in ſuch angles, where the round tool cannot be made to touch.

Fig. 13. is a hexagon, which may be engraved without difficulty, ſince all its points correſponding by two and two, nothing is required but to trace three lines, croſſing each other in a common centre. Another difficulty there is with regard to the letters, which cannot be executed in the manner of thoſe that are ſeen on medals (ſee fig. 17.); the tool will always leave ſome imperfection in the angles of the extremities, as appears in fig. 14 and 15. The beſt engravers of antiquity have preferred to make uſe of the bouterolle to mark the termination of the letters and ſeveral other objects.

The head of Jupiter Serapis, repreſented figs. 16, 17, and 18, is given by Natter, as an example of the mode of proceeding, in order to produce a work of that deſcription.

A ſtone is to be procured, cut into an oval form, convex above, ſuch as fig. 18. It matters little, whether its baſe is flat or convex, provided it be of ſufficient thickneſs to bear the engraving. Being fixed to a handle, as above deſcribed, the engraver begins his operation by excavating, with a ſemicircular tool, an oval of the ſize of the head in queſtion; but leſt this operation ſhould produce a round figure inſtead of an oval, the ſtone is to be gradually moved in the direction

of

of its greater diameter. This is continued till the oval is of ſufficient depth, to begin the eyes. See fig. 18. *a*.

You may proceed in a longitudinal direction upwards, as far as to the middle of the *modium* on the head, expreſſed by the upper end of the dotted line *a*; and downwards as far as to the middle of the neck. The breadth of the oval is to be made in proportion.

This being done, you may work out the place for the hair, which, in order to imitate the original, fig. 16, ſhould be more projecting on the one than on the other ſide. The beard may be marked with the ſame tool as far downwards as *b*, fig. 18, and ſideways as far as *b*, fig. 17. After this the tool is changed for a ſmaller one to mark the forehead *c*, as alſo the modium; and, in order to avoid the unneceſſary ſhifting of tools, the ſhoulders may be begun upon with the ſame tool.

The foundation being laid in this manner, a narrower tool is taken, which is a little rounded, and whoſe ſize is adapted to the length of the noſe of the portrait; with this the form of the noſe, cheeks, and neck are engraved in ſtraight lines. See letter *d*, figs. 17 and 18.

After this a ſmall tool is required to croſs the top of the noſe, by which means the noſtrils are formed; with it alſo the eyes are ſketched, and the principal locks of hair. (See *f*. figs. 17 and 18.) Laſtly, the knobbed tool is uſed to produce the rounded tip of the noſe, which is to be brought into uniſon with the other parts already ſketched. (See *g*, figs. 17 and 18.)

When the figure is ſo far executed, ſmaller and more cutting tools are employed to finiſh it; for which latter operation depending entirely on the ſkill of the artiſt, no rules can be laid down.

In order to give the higheſt degree of poliſh to the engraving, boxwood, pewter, or copper tools with moiſtened tripoli or rotten-ſtone, and laſtly a bruſh, are faſtened to the mill, and ſet in motion in the ſame manner as the tools; the ſtone being brought into contact with them. The modern engravings have not nearly the ſame high poliſh as moſt of thoſe of antiquity.

It is obvious, that before ſuch a work can be entered upon, the engraver muſt be able to deſign and model the head in its juſt proportions, either in wax or clay; for without ſuch preparation no engraving can be expected to ſucceed. *Unexperienced* beginners, in copying the model, will often engrave leſs prominent parts before the more projecting are wrought ſufficiently deep, the conſequence of which is, that they are obliged to deſtroy a work ſo injudiciouſly commenced. An inconvenience of another nature ariſes from working too deep in the beginning; for in this caſe, in order to preſerve the work, it will afterwards be required to have the ſtone ground down by the lapidary. It is, therefore, better to proceed ſlowly and with caution, which enſures ſucceſs, than, by hurrying, run the riſk of loſing your labour and of deſtroying the ſtone.

On examining this head of Jupiter Serapis, which is not a work of great merit, it will be ſeen that the engraver has been obliged to trace at the left ſide of the head a lock of hair of greater breadth than appears neceſſary for juſt proportion: the reaſon for doing ſo was, that without it he could not well have finiſhed the ſmall parts, ſuch as the eyes, the noſe, mouth, &c.; whereas, having procured more room by this excavation, he found himſelf enabled to enter with the ſmaller tools, and to finiſh his engraving according to the ſhare of ſkill he poſſeſſed.

GEMS, *Impreſſions of*. See IMPRESSIONS.

GEMAAGIDID, or DELGUMUTU, in *Geography*, a town of Morocco; 40 miles S. W. of Morocco.

GEMAPPE. See JEMMAPE.

GEMARA, or GHEMARA, the ſecond part of the Talmud. The word גמרה, *gemara*, is commonly ſuppoſed to denote a ſupplement; but, in ſtrictneſs, it rather ſignifies complement, perfection: being formed of the Chaldee גמר, *gemar*, or *ghemar*, *to finiſh*, *perfect*, or *complete* any thing.

The rabbins call the Pentateuch, ſimply, the law. The firſt part of the Talmud, which is only an explication of the law, or an application thereof to particular caſes, with the deciſions of the ancient rabbins thereon, they call the Miſchna *i. e.* ſecond law; and the ſecond part, which is a more extenſive and ample explication of the ſame law, and a collection of deciſions of the rabbins poſterior to the Miſchna, they call Gemara, *q. d.* perfection, completion, finiſhing; becauſe they eſteem it the finiſhing of the law, or an explication, beyond which there is nothing farther to be deſired.

The Gemara is uſually called, ſimply, Talmud, the common name of the whole work. In this ſenſe we ſay, there are two Gemaras, or Talmuds; that of Jeruſalem, and that of Babylon: though, in ſtrictneſs, the Gemara is only an explication of the Miſchna, given by the Jewiſh doctors in their ſchools; much as the commentaries of our ſchool divines on St. Thomas, or the maſter of the ſentences, are an explication of the writings of thoſe authors.

A commentary, M. Tillemont obſerves, was wrote on the Miſchna by one Jochanan, whom the Jews place about the end of the ſecond century; but as it is generally believed that the Miſchna was not written till towards the cloſe of the ſecond century, the Gemara muſt have been compiled at a later period. Accordingly this Gemara is ſuppoſed to have been the production of ſome period between the years 300 and 400. Indeed, the Jews themſelves confeſs that the Gemara of Babylon was ſubſequent to the Miſchna about 316 years. But a great difference of opinion prevails among the learned, concerning the time when the Miſchna was written, ſome referring it to the end of the ſecond century, others to the end of the fourth, or end of the fifth, or beginning of the ſixth century. Wolfius obſerves, in his preface to his "Bibliotheca Hebræa," (p. 28.) that the Jews affirm the Miſchna to have been written 316 years before the Gemara of Babylon, and that the Jeruſalem Gemara was 83 years before the other Gemara. See MISCHNA. But F. Morin argues from the work itſelf, wherein mention is made of the Turks, that it was not written till the time of Heraclius, or about the year 620; and this is what is called the Gemara, or Talmud of Jeruſalem, which the Jews do not uſe or eſteem much, becauſe of its obſcurity.

They ſet a much greater value on the Gemara, or Talmud of Babylon, begun by one Aſa; diſcontinued for ſeventy-three years, on occaſion of the wars with the Saracens and Perſians; and finiſhed by one Joſa, about the cloſe of the ſeventh century. See TALMUD.

Though the name Talmud, in its latitude, includes both the Miſchna and the two Gemaras; yet it is properly that of Aſa and Joſa, alone, which is meant under that name. This the Jews prize above all their other writings, and even ſet it on a level with ſcripture itſelf; in effect, they conceive it as the word of God, derived by tradition from Moſes, and preſerved, without interruption, to their time. R. Jehuda, and afterwards R. Jochanan, R. Aſa, and R. Joſa, fearing the traditions ſhould be loſt in the diſperſion of the Jews, collected them into the Miſchna, and the Gemara. See CARAITES and RABBINISTS.

GEMATRIA, or GAMETRIA, the firſt kind of artificial cabbala uſed by the Jews.

The

The word is formed from the rabbinical Hebrew גימטריא, formed by corruption of the Greek.

Gematria is a geometrical or arithmetical method of explaining words, whereof there are two kinds; the firſt bearing a more immediate relation to arithmetic, and the latter to geometry.

The firſt conſiſts in taking the numerical value of each letter in a word or phraſe, and giving it the ſenſe of ſome other word, whoſe numerical letters, taken after the ſame manner, make the ſame ſum. For it is to be obſerved, that neither the Hebrews, nor the Greeks, have any numerical figures, beſides the letters of the alphabet.

Thus, a cabbaliſt, taking the two firſt words in Geneſis, בראשית ברא, and by addition getting the ſum total of all the numbers, ſignified by thoſe letters, finds that theſe two words ſignify the ſame as thoſe other three, בראש-השנה-נברא. For as to the firſt, ב is 2; ר, 200; א, 1; ש, 300; י, 10; ת, 400; ב, 2; ר, 200; and א, 1; which, together, make 1116. And, as to the latter, ב ſignifies 2; ר, 200; א, 1; ש, 300; ה, 5; נ, 50; ש, 300; ה, 5; נ, 50; ב, 2; ר, 200; and א, 1 which, ſummed up, yield the ſame number 1116

Whence the cabbaliſt concludes, בראשית־ברא, *in the beginning he created*, ſignifies the ſame thing as בראש השנה נברא, *it was created at the beginning of the year:* and, accordingly, the received opinion of the cabbaliſts is, that the world was created at the beginning of the month Tiſri, which was anciently the firſt month in the year, and anſwers to our firſt month in autumn, *viz.* September.

So, again, in the prophecy of Jacob, Gen. xlix. 10. the words יבא שילה, are underſtood of the Meſſiah, becauſe they make the ſame number with משיח, which ſignifies the Meſſiah.

The ſecond kind of Gematria is much more obſcure and difficult; and, accordingly, is leſs uſed. It is employed in ſeeking for abſtruſe and hidden interpretations, in the dimenſions and parts of the buildings mentioned in ſcripture, by dividing, multiplying, &c. thoſe meaſures by each other. Of this we ſhall give an example from ſome Chriſtian cabbaliſts.

The ſcripture ſays, that Noah's ark was 300 cubits long, 50 wide, and 30 high: now the cabbaliſt takes the length for the baſis of his operations; 300, in the Hebrew, is expreſſed by the letter ש, which length, divided by the height 30, gives the quotient 10, the Hebrew character whereof is י; this is to be placed on the right ſide of ש: he then divides the ſame length by the width, 50, the quotient whereof, 6, is expreſſed by a ו, which, being placed on the left ſide of ש, makes, together with the other two letters, the name Jeſus, ישו. Thus, by the rules of the cabbala, it appears, that there is no ſalvation but in Jeſus Chriſt; as, at the deluge, no perſon was ſaved but thoſe in the ark.

After the like manner is the ſame name ישו found in the dimenſions of Solomon's temple. But it is rather an injury than an advantage to the Chriſtian religion, to ſupport it by ſuch frivolous evidences.

GEMBICZ, or GEMBOCK, in *Geography*, a town of the duchy of Warſaw; 16 miles E. N. E. of Gneſna.

GEMBLOUX, GEMBLOURS, or GIBLOU, a town of France, in the department of the Sambre and Meuſe, and chief place of a canton, in the diſtrict of Namur, ſituated on the ſmall river Orneau, which runs into the Sambre; 10 miles N. W. of Namur. The place contains 1531, and the canton 10,500 inhabitants, on a territory of 157½ kiliometres, in 30 communes. This town was famous for its ancient abbey, which had once the privilege of coining money, and poſſeſſed a celebrated library, which contained a number of ancient and valuable MSS., among which was the "Chronicum Gemblacenſe," well known among the learned, begun by Sigebert, a monk, who died in the year 1112, and continued by Anſelm, the abbot, to his death in 1137. Gembloux has twice, *viz.* in 1678, and in 1712, ſuffered much by fire.

GEMELLÆ, in *Ancient Geography*, *Jimméelah*, an epiſcopal town of Africa, ſituated about four leagues N. E. of Satafi, in the eaſtern part of Mauritania Cæſarienſis. This place is diſtinguiſhed by ſome ancient ruins of the gate of the town, and of an amphitheatre.

GEMELLES, in *Heraldry*, a bearing of bars by pairs, or in couples, in a coat of arms. He beareth gules, on a chevron, argent, three bars gemelles, ſable, by the name of Throgmorton.

GEMELLI, CARERI FRANCIS, in *Biography*, an advocate at Naples, who made the tour of Europe in the year 1683, of which he publiſhed an account in one volume. In 1693, he undertook a voyage round the world, which he completed in 1698, and of this he publiſhed a narrative in the year 1700, which was ſeveral times re-edited, and was tranſlated into French and Engliſh, and admitted into various collections of voyages and travels. This work is frequently referred to and quoted, though the facts contained in it are certainly of queſtionable authority. It is, however, conſidered as valuable for the objects of curioſity it points out, and for the directions it gives for ſafe and uſeful travelling.

GEMELLUS, in *Anatomy*, a name ſometimes given to the *gaſtrocnemius*, which ſee.

GEMERURCH, in *Geography*, a town of Perſia, in the province of Irak; 60 miles S. W. of Kermanſha.

GEMIANA, a town of Egypt, 18 miles S. of Damietta.

GEMIGNANO, ST. VINCENTIO DI, in *Biography*, a painter, born at San Gemignano, in Tuſcany, in 1490, who became a diſciple of Raphael, and wrought for him with much ſucceſs in the chambers of the Vatican. He alſo performed many works under the eye of Raphael, in which he imitated the ſtyle and manner of that great man; but when he loſt him, his talents were not found equal to ſupport the reputation he had previouſly acquired. He died in 1530, at the age of 40.

GEMINATED COLUMN. See COLUMN.

GEMINGEN, in *Geography*, a town of Germany, in the palatinate of the Rhine; ſix miles N. W. of Heilbronn.

GEMINI, in *Anatomy*, iſchii-trochanteriens; are two ſmall and ſhort muſcles, ſituated at the poſterior part of the pelvis, the one above, and the other below the tendon of the obturator internus, which they nearly cover. They are diſtinguiſhed from each other by the epithets ſuperior and inferior. The geminus ſuperior extends from the ſpinous proceſs of the iſchium, in a horizontal direction, to the hollow behind the trochanter major of the thigh bone. It lies in front upon the os innominatum, and the capſule of the hip-joint; and is covered behind by the gluteus maximus, and great ſciatic nerve. The upper margin of the muſcle is parallel with, and contiguous to, the under edge of the pyramidalis; while the inferior, by its outer half, is confounded with the tendon of the obturator internus, by its inner half, is connected to the ſame tendon, by means of a thin aponeurotic expanſion. The inner extremity is fixed to the ſpine of the iſchium, from which point the fibres are continued horizontally, to the upper and back part of the trochanter, where the outer extremity is attached. It is compoſed entirely of muſcular fibres, except towards the outer

outer end, where it has a tendon united to that of the obturator externus.

The geminus inferior reſembles the former in figure and direction, covered behind by the gluteus maximus, and great ſciatic nerve, it covers in front the os innominatum and capſule of the hip. The lower margin is parallel with, and cloſe to, the upper margin of the quadratus femoris; the upper, like the lower of the preceding muſcle, is connected to the tendon of the obturator externus. Indeed the oppoſed edges of the two gemini are connected together, ſo as to form a groove, in which the obturator tendon is lodged. The inner extremity is fixed to the upper and back part of the tuberoſity of the iſchium; the fibres run horizontally outwards, and are attached to the trochanter, cloſe to the preceding muſcle. It conſiſts of fleſhy fibres, with the exception of the outer extremity.

By drawing the trochanter major backwards, the two gemini will rotate the femur outwards on its axis. When the limb is bent, they will aſſiſt in ſeparating it from the oppoſite, or carrying it into the ſtate of abduction. If the thigh be fixed, they may rotate the pelvis outwards or backwards upon the head of the femur.

GEMINI, in *Aſtronomy*, the *Twins*; a conſtellation, or ſign of the zodiac, the third in order, repreſenting Caſtor and Pollux; and it is marked thus, II. See CONSTELLATION.

This conſtellation was anciently depicted by a couple of young kids, by the Egyptians and eaſtern nations, as denoting that part of ſpring, when theſe animals appear; but the Greeks altered them to two children, which ſome of them repreſented by Caſtor and Pollux, ſome by Hercules and Apollo, and others by Triptolemus and Jaſion; but the Arabians afterwards changed them into two peacocks, their religion not allowing them to paint or draw any human figure. Sir Iſaac Newton thinks, that the figures had ſome reference to the Argonautic expedition. The ancients attributed to every ſign of the zodiac one of the principal deities for its tutelary power. Phœbus had the care of Gemini, and hence aroſe all the jargon of aſtrologers about the agreement of the ſun and this conſtellation.

GEMINI, *St.* in *Geography*, a town of Italy, in the duchy of Spoleto; ſix miles N. of Narni.

GEMINIANI, FRANCESCO, in *Biography*, a muſician of great abilities and renown. He was a native of Lucca, born about the year 1666; and received his firſt inſtruction on the violin of Carlo Ambrogio Lonati, of Milan, commonly called Il Gobbo, a celebrated performer on that inſtrument, who ſet the opera of "Ariberto & Flavio" for Venice, in 1684. After this, he ſtudied counterpoint under Aleſ. Scarlatti at Rome, where he became a diſciple of Corelli on the violin; and having finiſhed his ſtudies there, he went to Naples, where, from the reputation of his performance at Rome, he was placed at the head of the orcheſtra; but, according to the elder Barbella, he was ſoon diſcovered to be ſo wild and unſteady a timiſt, that inſtead of regulating and conducting the band, he threw it into confuſion; as none of the performers were able to follow him in his *tempo rubato*, and other unexpected accelerations and relaxations of meaſure.

The younger Barbella aſſured the writer of this article, that his father, who well remembered the arrival of Geminiani at Naples, ſaid he was never truſted with a better part than the tenor during his reſidence in that city.

He arrived in England in 1714, and in 1716 publiſhed in London his firſt work, conſiſting of 12 ſolos for the violin, dedicated to baron Kilmanſegge, on the plan of Corelli; ſix with double ſtops, and ſix ſingle, which, though few could execute, yet all the profeſſors allowed them to be maſterly; more learned and difficult than thoſe of his model, but not ſo pleaſing. Theſe ſolos ſeem to have been previouſly publiſhed at Amſterdam by le Cene; we are in poſſeſſion of a copy beautifully engraved on copper. In 1726 he formed Corelli's firſt ſix ſolos into concertos, and ſoon after the laſt ſix. He likewiſe ſelected ſix of his ſonatas for the ſame purpoſe, and imitating his ſtyle in compoſing additional parts to them, manifeſted how much he reſpected the originals. It was not till the year 1732 that Geminiani publiſhed his firſt ſix concertos, which he called his "Opera ſeconda," and dedicated to the ducheſs of Marlborough. Soon after this, his "Opera terza," or ſecond ſet of concertos, appeared, which eſtabliſhed his character, and placed him at the head of all the maſters then living, in this ſpecies of compoſition.

His ſecond ſet of ſolos, commonly called his French ſolos, either from their ſtyle or their having been compoſed and engraved in France, was publiſhed in 1739. Theſe were admired more than played; as about this time it became more than ever the faſhion for public ſolo-players to perform only their own compoſitions, and others were unable to execute them. His third ſet of concertos, which appeared about the year 1741, was ſo laboured, difficult, and fantaſtical, as never to be performed, to our knowledge, in either public place, or private concert.

His long-promiſed work, with the title of "Guida Armonica," publiſhed in 1742, appeared too late; for though there are many combinations, modulations, and cadences, that would open the mind and enrich the memory of a young ſtudent in harmony, he promiſed too much. The original title runs thus; "Guida Armonica o Dizionario Armonico," being a ſure guide to harmony and modulation, in which are exhibited the various combinations of ſounds, progreſſions of harmony, ligatures, and cadences, real and deceptive." It was a kind of mill, in which good muſic was to be ground with little trouble and no genius; as good ſenſe and ſcience by the Laputan machine, in Gulliver's travels; and his authority in the kingdom was diminiſhed by new muſic and new performers, as well as by his own frequent change of ſentiment: ſetting up at one time as a model of perfection, what he would deſpiſe and condemn at another.

His "Treatiſe on Good Taſte, and Rules for Playing in Good Taſte," did not appear till about 1747, but that was too ſoon for the preſent times. Indeed a treatiſe on good taſte in dreſs, during the reign of queen Elizabeth, would now be as uſeful to a tailor or milliner, as the rules of taſte in muſic, forty years ago, to a modern muſician.

In 1748, he publiſhed his "Art of Playing the Violin," which was a very uſeful work in its day; the ſhifts and examples of different difficulties, and uſes of the bow, being infinitely ſuperior to thoſe in any other book of the kind, or indeed oral inſtruction, which the nation could boaſt, till the arrival of Giardini.

His compoſition, called the "Enchanted Foreſt," in which he endeavoured by mere ſound to repreſent to the imagination of an audience all the events in the epiſode of the thirteenth book of Taſſo's Jeruſalem, was publiſhed about 1756; but muſic has never had the power, without vocal articulation, to narrate or inſtruct; it can excite, paint, and ſoothe our paſſions; but is utterly incapable of reaſoning, or converſing, to any reaſonable purpoſe.

Beſides theſe practical and theoretical works, he publiſhed two books of "harpſichord pieces," that are rendered impracticable by crouded harmony and multiplied notes; and two books upon the "art of accompaniment," which are only intelligible

telligible to thoſe who no longer want ſuch aſſiſtance; and if practiſed, would be intolerable to fingers and ſolo-players, who wiſh to be heard through the tinkling of a harpſichord.

Geminiani was ſeldom heard in public during his long reſidence in England. His compoſitions, ſcholars, and the preſents he received from the great, whenever he could be prevailed upon to play at their houſes, were his chief ſupport. In 1731, he advertiſed a "weekly conſort" of muſic, to be carried on at Hickford's room, by ſubſcription, and at which he played the firſt violin himſelf. This concert was advertiſed to be carried on the next year by Arrigoni and San Martini, "in the ſame manner as by ſignor Geminiani, who had declined the undertaking; the firſt violin by ſignor Carbonelli." In 1741, he had a benefit concert at the little theatre in the Hay-market, by command of their royal highneſſes the late prince and princeſs of Wales. And in 1749, a "concerto ſpirituale," during Lent, at Drury-lane theatre; in which he led the band, and played a concerto, from the fifth ſolo of his fourth opera, and the tenth ſolo of the ſame ſet. The unſteady manner in which he led, ſeemed to confirm the Neapolitan account of his being a bad mental arithmetician, or calculator of time. After this, he went to Paris, where he continued till 1755, when he returned to England, and publiſhed a new edition of his two firſt ſets of concertos. In 1761, he went to Ireland, to viſit his ſcholar Dubourg, maſter of the king's band in that kingdom, who always treated him with great reſpect and affection. It is ſuppoſed that his death was accelerated there the next year, by the loſs of an elaborate treatiſe on muſic, which he had been many years compiling, and which, by the treachery of a female ſervant, was conveyed out of his room, and could never be recovered. Surviving this loſs but a ſhort time, he died at Dublin, September 17th, 1762, at the great age of ninety-ſix.

Geminiani, with all his harmonical abilities, was ſo circumſcribed in his invention, that he was obliged to have recourſe to all the arts of muſical cookery, not to call it quackery, for materials to publiſh. In his younger days, when imagination is moſt fertile, ſixteen years elapſed between the publication of his firſt book of ſolos and his firſt ſix concertos. Indeed, during that period, he atchieved what a plodding contrapuntiſt of inferior abilities might have done as well: he transformed Corelli's ſolos and ſix of his ſonatas into concertos, by multiplying notes, and loading, and deforming, we think, thoſe melodies, that were more graceful and pleaſing in their light original dreſs. After the publication of his ſecond ſet of ſolos, his productions ſeem to have been the offſpring of whim, caprice, expedients, and an unprincipled change of ſtyle and taſte, which neither pleaſed the public, nor contributed to his own honour or profit. One day he would ſet up French muſic againſt all other; the next Engliſh, Scots, Iriſh—anything but the beſt compoſitions of Italy or Handel. It is well known how much he preferred the character of a picture-dealer, without the neceſſary knowledge or taſte in painting, as very good judges aſſerted, to that of a compoſer of muſic, by which he had ſubſiſted and acquired all his fame and importance. It is to be feared that a propenſity towards chicane and cunning, which gratifies ſome diſpoſitions more by outwitting mankind, than excelling them in virtue and talents, operated a little upon Geminiani; whoſe muſical deciſions, ceaſing to be irrevocable in England, determined him to try his hand at buying cheap and ſelling dear; impoſing upon groſſer ignorance with falſe names, and paſſing off copies for originals. As a muſician, he was certainly a great maſter of harmony, and very uſeful to our country in his day; but though he had more variety of modulation, and more ſkill in diverſifying his parts than Corelli, his melody was even inferior, and there is frequently an irregularity in his meaſures and phraſeology, and a confuſion in the effect of the whole, from the too great buſineſs and diſſimilitude of the ſeveral parts, which gives to each of his compoſitions the effect of a rhapſody or extemporaneous flight, rather than a poliſhed and regular production. His ſixth concerto of the ſecond ſet is always to be excepted, which is the moſt pleaſing and perfect compoſition of the kind, within our knowledge.

GEMINIANO, St., in *Geography*, a town of Etruria, ſeated on a mountain, with a beautiful palace; near which is a mine of vitriol; 24 miles S. of Florence.

GEMIST, George, in *Biography*, an eminent Greek philoſopher, was born at Conſtantinople in the year 1390. He reſided chiefly in the Peloponneſus, where he acquired a high character for his learning and prudence. He was a zealous advocate for Platoniſm, and maintained a violent controverſy with the Ariſtotelians. He was a ſtrenuous defender of the Greek church againſt the Latins, and was conſulted as an oracle on the points in debate. When a deputation was ſent from Greece to attend the council of Florence, in the year 1438, in order to diſcuſs the ſubject of an union between the Greek and Latin churches, he was appointed a member of it, and ſuſtained the cauſe of the Greeks with an acuteneſs of reaſoning, and a flow of eloquence which entitled him to the gratitude of his countrymen, and extorted the eſteem and admiration of his Latin opponents. But the viſit of Gemiſt to Italy was more memorable, as it afforded him an opportunity of reviving Platoniſm in that country, and he loſt no means of expatiating on the ſuperior excellence of his favourite ſyſtem, but defended it in public and private with great ſpirit and ſucceſs. He made many illuſtrious converts among the literary characters then aſſembled in Florence, and in the number was Coſmo de Medici. By the influence which he had over this patron of ſcience and literature, the foundation of a Platonic academy was laid at Florence, and under the inſtructions of Gemiſt, the firſt preſident, Marſilius Ficinus, of that inſtitution, was formed. After the termination of the council of Florence, Gemiſt returned to Greece where he died at the advanced age of nearly one hundred years. He left behind him numerous works, which afford ample evidence of his profound erudition, and of his intimate acquaintance with the Alexandrian Philoſophy. The principal are "De Geſtis Græcorum poſt pugnam ad Mantineam, duobus Libris digeſta." "De virtutibus Libellus," which has been reprinted in many forms, and illuſtrated by various commentators: "De rebus Peloponneſiaſis conſtituendis Orationes duæ," with an appendix containing a deſcription of all the places in the Peloponneſus, their longitudes and latitudes taken from Ptolemy, and corrected by the author: "De Platonicæ et Ariſtotelicæ Philoſophiæ Differentia." Gemiſt was author likewiſe of a number of theological, hiſtorical, rhetorical, and philoſophical pieces: alſo of a work entitled "In Oracula magica Zoroaſtris Commentarii," in which he gives an elegant compendium of the Platonic philoſophy. Moreri. Enfield's Hiſt. Phil.

GEMMA, Cornelius, the ſon of Reinier Gemma, (who was a phyſician, but diſtinguiſhed chiefly by his mathematical and aſtronomical knowledge,) was born at Louvain in February, 1535. He became royal profeſſor of medicine in his native place in 1569, through the appointment of the duke of Alba, at which time he took the degree of doctor. But he did not enjoy his honours many years; for he was cut off by the plague, which raged at Louvain, on the

the 12th of October 1577. His writings are not numerous, and relate to mathematical and philoſophical ſubjects as well as to medicine.

GEMMA, JOHN BAPTIST, a native of Venice, and a phyſician of conſiderable repute about the end of the fifteenth century. He was phyſician to Sigiſmund III. king of Poland. He wrote a treatiſe, containing a hiſtory of peſtilential epidemics, with a detail of the effects of contagion, &c., and entitled, "De vera ratione curandi bubonis atque carbunculi peſtilentis deque eorundem, Commentarius." 1584. Eloy.

GEMMA, in *Botany* and *Vegetable Phyſiology*, a bud, moſt probably from γιμω, *to be full*. See BUD.

In addition to what is ſaid in that place, it is neceſſary to caution the ſtudent againſt an error of ſome philoſophers, eſpecially Dr. Darwin in the ninth ſection of his *Phytologia*, who draws a too cloſe, and indeed erroneous, analogy, between buds and the embryo of a ſeed, or the chick in the egg. By buds, it is true, plants are propagated and increaſed, and in that ſenſe each bud becomes a ſeparate being, or new plant; but ſuch propagation is only the extenſion of an individual, and not a reproduction of the ſpecies, in conſequence of ſexual impregnation, as by ſeed. This was long ago obſerved, in oppoſition to the opinions and experiments of Spallanzani, by the author of the preſent article. See Diſſertation on the Sexes of Plants, tranſlated from the Latin of Linnæus, p. 45, note. Accordingly, all plants increaſed by buds, cuttings, layers or roots, retain preciſely the peculiar qualities of the individual from which they are taken. Thus varietiesare propagated, which commonly vaniſh in the legitimate ſeminal progeny, and thus, as Mr. Knight has obſerved of the different kinds, or varieties, of apples and pears, each individual ſo propagated has only a determinate period of exiſtence. The date of ſuch varieties in Cape Geraniums is uſually very ſhort; in apples and pears it is generally, not always, very much longer; in willows, ſo readily increaſed by cuttings, apparently without end, it ſeems to be almoſt unlimited, for no cultivator has yet remarked any advantage in renewing oſiers of any kind from ſeed; but we apprehend the ſubject has not been properly attended to. As ſuch willows do, to our knowledge, ſow themſelves frequently, their ſeedlings may unconſciouſly be preferred, for ſome characters of vigour in their appearance, by thoſe who are about to chooſe cuttings. Gardeners well know that many of the moſt hardy perennial herbs require frequent renewal from ſeed, in order to exiſt with vigour. Propagation by ſeed is therefore the only true reproduction of plants. How that is accompliſhed we have already explained. Seee FECUNDATION *of Plants*.

Some very eminent Cryptogamic botaniſts, as Gærtner and even Acharius, contend for eſexual propagation in the lower tribes of vegetables. This is particularly inſiſted upon by the former with reſpect to *Fuci*, in the introduction to his great work on ſeeds, p. 32; and yet what he details in the following page, of the impregnation of the ſeeds of thoſe plants by a mucus formed in their germen or ovarium, is really equivalent to ſexual impregnation. Acharius extends the eſexual theory, not indeed without ſome doubts, to *Byſſi*, *Lichenes*, and *Fungi*. If however the propagation of theſe or any other plants be truly eſexual, what theſe writers term *ſporæ*, and ſeem to think equivalent to ſeeds, are eſſentially nothing but *gemmæ*, and the analogy of all other vegetables is againſt any continued propagation or reproduction by ſuch means. It was a moſt extraordinary and unaccountable overſight in the great Hedwig, to adopt this term of *ſpora* for the ſeed of moſſes, though his own brilliant theory of their ſexual impregnation, which has brought him ſo much deſerved reputation, proves that part to be a real ſeed; whereas the term *ſpora*, indicating the contrary, ſerves only to invalidate his own hypotheſis! S.

GEMMA *Veneris*, in *Natural Hiſtory*, a name given by ſome of the Latin poets, and other authors in that language, to a gem, which was much eſteemed by the Romans, and ſet in rings. It was called by the Greeks *aphrodites*. Many have ſuppoſed this to be the opal; but it is certain, from the oldeſt accounts, that the moſt beautiful kind of the amethyſt was the gem they called by this name. They diſtinguiſhed the amethyſt as all the other gems, into ſeveral kinds, according to the degrees of the colour; and to the moſt eminent of theſe they gave peculiar names, as is evident in the ſeveral kinds of the emerald and beryl. The worſt amethyſts were thoſe which had very little colour beyond that of cryſtal, and the very beſt were thoſe which had the fine red of the carbuncle, mixed with the purple of the violet, and the whole ſo pale, that a roſe-colour ſeemed blended with them, and predominated over the reſt. Theſe, Pliny tells us, were called *pæderotes* and *anterotes*, and were the gems called, from their beauty, *aphrodites lapis*, and *gemma Veneris*; but all theſe names have been ſince given by others to the opal.

GEMMÆ, *Sal*, is peculiarly uſed for rock ſalt, or ſalt dug out of mines. See SALT.

The name gemma is applied to this on occaſion of its luſtre and brilliancy, which is not unlike that of cryſtal.

The principal mines of this ſalt are thoſe of Wiliſca, in Poland; thoſe of Eperia, in Upper Hungary; and thoſe of Cardonna, in Catalonia.

The chief uſe of this ſalt is for the powdering or pickling of meats, in places deſtitute of ſalt ſprings, &c.

GEMMEUM, an epithet uſed by the Latins to expreſs ſuch veſſels as were called *dialitha* and *lithocolla* by the Greeks. The more correct Roman authors, however, call this *gemmatum poculum*, and not *gemmeum*; the word gemmeum ſignifying properly a vaſe or cup, cut out of a ſingle ſtone, as an agate, or the like; but gemmatum expreſſing thoſe fine vaſes of gold, which were ornamented with emeralds and other precious ſtones.

GEMMI, in *Geography*, part of a chain of mountains of Switzerland, which ſeparates the canton of Bern from the Vallais; the point of which, that overlooks and almoſt overhangs the Vallais, affording a moſt extenſive proſpect over that fertile country and the rugged alps of Savoy. Although this mountain is, in many places, almoſt perpendicular, a horſe-road has been hewn in the hard rock down this formidable deſcent. This aſtoniſhing work was begun in 1736, and finiſhed in 1741, at the joint expence of the Vallais and the canton of Bern. More than a league of it has been blown up with gunpowder. This road is about nine feet broad, and quite hangs over the precipice; in ſome parts it is hollow, open only at one ſide, the rock above projecting over it, of the ſame breadth. The effect is very ſtriking; for, as the road winds continually, the ſcene alſo changes; ſo that at one moment the paſſage commands an extenſive view, and in the next is incloſed with barren rock. The deſcent from the top to the plain is about two leagues.

GEMONA, a town of Italy, in Friuli, old but opulent. In this place the merchandiſe brought from Germany is detained and ſearched by officers of the cuſtoms. The diſtrict contains 32 villages. In 1797, it was taken by the French; 21 miles N.W. of Friuli. N. lat. 46° 20'. E. long. 12° 59'.

GEMONIÆ SCALÆ, or *Gradus Gemonii*, among the

Romans, was much the ſame as a gallows, or gibbet, in England.

Some ſay, they were thus denominated from the perſon who raiſed them; others, from the firſt criminals that ſuffered on them; and others, from the verb *gemo*, *I ſigh* or *groan*.

The *gradus gemonii*, according to Publius Victor, or Sextus Rufus, was a place raiſed on ſeveral ſteps, from whence they precipitated their criminals; others repreſent it as a place whereon offenders were executed, and afterwards expoſed to public view. The gemoniæ ſcalæ were in the tenth region of the city, near the temple of Juno. Camillus firſt appropriated the place to this uſe, in the year of Rome 358.

GEMONIDES, a name by which ſome of the ancients have called the peantides; probably the ſame with our ſtalactites, a ſtone famous with them for its ſuppoſed virtue in promoting delivery.

GEMOTE, or GEMOT, *Conventus*, a Saxon word, denoting a meeting or aſſembly.

"Omnis homo pacem habeat eundo ad gemotum & rediens de gemoto, niſi probatus fur fuerit." Ll. Ed. Conf. See WITTENA.

GEMOZAC, in *Geography*, a town of France, in the department of the Lower Charente, and chief place of a canton, in the diſtrict of Saintes; 10 miles S. of Saintes. The place contains 2396, and the canton 15,759 inhabitants, on a territory of 247½ kiliometres, in 17 communes.

GEMSHORN, a ſtop in German organs, which anſwers to our principal and flute. It is 16, 8, 4, or 2 feet, in proportion to the ſize of the inſtrument. Walther.

GEMUND, in *Geography*, a town of France, in the department of the Roer, and chief place of a canton, in the diſtrict of Aix-la-Chapelle, ſeated on the Ruhr; 41 miles W.N.W. of Coblentz. N. lat. 50° 37'. E. long. 6° 28'.

GEMUND, or *Gmund*, a town of Wurtemberg, on the Rembs. In 1802, this town, which was imperial, was granted among the indemnities to the duke (now king) of Wurtemberg; 24 miles E. of Stuttgart. N. lat. 48° 44'. E. long. 9° 50°.

GEMUND, or *Gemunden*, a town of Germany, in the biſhopric of Wurtzburg, on the right bank of the Maine, where it is joined by the united ſtreams of the Saal and the Sinn; 37 miles E. of Frankfort. N. lat. 50° 9'. E. long. 9° 52'.—Alſo, a town of Auſtria, ſituated on the Traunſee, celebrated for its ſalt-works; 24 miles S.S.W. of Lintz. N. lat 47° 65'. E. long. 13° 42'.

GEMUND, a town of the duchy of Carinthia; 32 miles N.W. of Clagenfurt. N. lat. 46° 50'. E. long. 13° 21'.—Alſo, a town of Auſtria; 60 miles N.W. of Vienna. N. lat. 48° 44'. E. long. 15° 3'.

GEMUNDEN, a town of France, in the department of Mont Tonnerre, famous for its fairs; 3 miles E. of Weſterburg.—Alſo, a town of Germany, in the principality of Heſſe-Caſſel; 28 miles S.W. of Caſſel. N. lat. 50° 59'. E. long. 9'.—Alſo, a town of Germany, in the principality of Calenberg; 13 miles S.W. of Gottengin.

GEMURSA, in *Surgery*, an excreſcence between the toes.

GENA. See CHEEK.

GENABUM, in *Ancient Geography*, called alſo "Civitas Aurelianorum," a town of Gaul, in the country of the Carnuti, ſuppoſed by ſome to be *Gien*, but by others, with greater probability, *Orleans*. Cæſar mentions it; and Strabo calls it the "emporium of the Carnuti," and ſays that it was ſituated upon the Loire, towards the middle of its courſe. The communication was ſo eſtabliſhed, and ſo neceſſary between this town and Chartres, that they had a public way, ſtill in ſome degree of preſervation, which was called the "way or road of Cæſar."

GENABUS, an epiſcopal town of Aſia, in Phrygia.

GENADEL, in *Geography*, a mountain of Nubia, over which the Nile paſſes, and forms a cataract; 120 miles S.S.W. of Syene.

GENADGE, a town of Egypt; 12 miles S. of Faoué.

GENÆ QUADRATUS. See QUADRATUS.

GENAPILLA, in *Geography*, a town of Hindooſtan, in the Carnatic; 36 miles W. of Nellore.

GENAPPE, a town of France, in the department of the Dyle, and chief place of a canton, in the diſtrict of Nivelles, ſituated on the Dyle; 5 miles E. of Nivelles. The place contains 1186, and the canton 8842 inhabitants, on a territory of 132½ kiliometres, in 71 communes.

GENARO MANNI, in *Biography*, a celebrated Neapolitan compoſer, in a ſolid yet ingenious ſtyle, between that of the church and the theatre. He was compoſer of the archiepiſcopal church at Naples in 1770, and much reſpected by profeſſors and real judges of muſic in that capital. His name will be embalmed with that of Jomelli, for his pious and active zeal at the public funeral of that admirable maſter in 1774, which he projected and conducted in a manner equally honourable to himſelf and his deceaſed friend. Sig. Saverio Mattie, the learned commentator and tranſlator of the Pſalms into Italian verſe, arranged in ſtanzas, and fitted for muſic of every ſpecies in the eccleſiaſtical ſtyle, has recorded this event in an intereſting pamphlet, which will live, and add longevity to the fame of theſe eminent profeſſors.

GENBARABA, in *Geography*, a town of Perſia, in the province of Irak; 100 miles E. of Hamadan.

GENBITA, a town of Africa, in Nubia; 65 miles N.E. of Dekin.

GENÇAY, a town of France, in the department of the Vienne, and chief place of a canton, in the diſtrict of Civray; 12 miles N.N.E. of Civray. The place contains 628, and the canton 8169 inhabitants, on a territory of 270 kiliometres, in 11 communes.

GENDARMES, or GENS D'ARMES, *q. d.* men of arms, a term uſed among the French for a ſelect body of horſe-guards; becauſe they ſucceeded the ancient men of arms, who were armed at all points, and thence were called gendarmes. Under the old government of France, the troops of the king's guard de corps, the muſqueteers, and light-horſe, were reputed to belong to the gendarmerie.

The grand-gendarmes, ſometimes called ſimply the gendarmes, were a troop of gentlemen, to the number of about 200, and in time of war 240, who guarded the king's perſon. The king himſelf was their captain, and one of the prime peers the captain-lieutenant, under whom were two ſub-lieutenants, three enſigns, and three guidons. When the king marched with all his houſhold troops, the gens d'armes cloſed the march. They were eſtabliſhed about the year 1665.

Their device was a thunder-bolt falling from heaven, with the motto, "Quo jubet iratus Jupiter." There were alſo, beſides theſe, gens d'armes of the queen, the dauphin, &c.

The gendarmery was a body of horſe, conſiſting of ſixteen companies, forming eight ſquadron, *viz.* the Scotch gendarmes, the Engliſh gendarmes, the Burgundy gendarmes, and the Flemiſh gendarmes, which four companies compoſed the king's gendarmes, or life-guard. The other companies took their names from the princes who commanded them, as captains, *viz.* the queen's gendarmes, the queen's light-

light-horſe; the dauphin's gendarmes, the dauphin's light-horſe; the duke of Burgundy's gendarmes, the duke of Burgundy's light-horſe; the duke of Orlean's gendarmes, &c. each troop, at a medium, conſiſted of ſeventy-ſix gendarmes, or light-horſe. Each company was divided into two brigades, one commanded by the captain-lieutenant, and the other by the ſub-lieutenant; and the ſubordinate officers were an enſign and guidon.

The gendarmerie took precedence of every regiment of horſe in the French ſervice, and ranked immediately after the king's houſhold. The uniform of this ſelect body of cavalry, under the old government, was ſcarlet, with facings of the ſame colour. The coat was formerly more or leſs laced with ſilver, according to the king's pleaſure. A little while before the revolution, it was only laced on the cuff. The waiſtcoat was of buff-leather, and the bandouleer of the ſame, ſilver-laced; the hat was edged with broad ſilver lace. The horſe-cloths and holſter-caps were red, and the arms of the captain were embroidered on the corners of the ſaddle-cloths, and on the front of the holſters. In 1762, a conſiderable body of men was raiſed by order of Louis XIV., and the ſoldiers that compoſed it were called gens d'armes; and in 1792, their number, conſiſting of horſe and foot, was augmented, and both were denominated indiſcriminately gens d'armes; but their cloathing was altered to deep blue. Their pay was greater than that of the reſt of the army; and their privileges were founded on the claims to military honour, which they were obliged to produce, before they were enliſted. Every individual was to exhibit a certificate of ſix or eight years' ſervice.

GENDER, Genus, in *Metaphyſics*. See Genus.

Gender, in *Grammar*, denotes a diviſion or diſtinction of nouns or names, according to the different ſexes of the things they denote.

It has been thought proper, in order to render diſcourſe more expreſs and diſtinct, as alſo to embelliſh it by a variety of terminations, to contrive certain diverſities in adjectives, accommodated to the ſubſtantives they are applied to; whence, from a regard to that notable difference there is between the two ſexes, all nouns ſubſtantive have been diſtinguiſhed into maſculine and feminine; and the nouns adjectives alſo varied to correſpond therewith.

Mr. Harris, obſerves, that in the diſtribution of genders, ſuch ſubſtantives might have been conſidered as maſculine, which were conſpicuous for the attributes of imparting or communicating; or which were, by nature, active, ſtrong, and efficacious, and that indiſcriminately whether to good or ill; or which had claim to eminence, either laudable or otherwiſe; the feminine, on the contrary, were ſuch as were conſpicuous for the attributes either of receiving, of containing, or of producing and bringing forth; or which had more of the paſſive in their nature than of the active; or, which were peculiarly beautiful and amiable; or which had reſpect to ſuch exceſſes as were rather feminine than maſculine. Thus the ſun, the ſky, time, death, God, &c. are maſculine; but the moon, the earth, a ſhip, a city, country, virtue, fortune, &c. are feminine. Hermes, p. 44, &c.

But as there was an infinity of words, which had no proper relation, either to the one ſex or the other, they had genders aſſigned them, rather out of caprice than reaſon; and hence it is, that the gender of a noun is frequently dubious and fluctuating. Though, as there are ſubſtantives that have evidently no ſex, the neuter gender expreſſing ſuch ſubſtances is as natural and rational a diſtinction as either of the others.

It ſhould here, however, be obſerved, that this inſtitution of genders was not made with deſign and deliberation by the maſters of language, but was introduced by cuſtom and uſage. At firſt, there was only a difference between the names of animals, when ſpoken of males and females; and, by degrees, the ſame regulation was extended to other things: the grammarians have only noted and allowed what uſage had eſtabliſhed. The oriental languages frequently neglect the uſe of genders; and the Perſian language has abſolutely none at all, which is no diſadvantage; the diſtinction of genders being in great meaſure uſeleſs.

The Latins, Greeks, &c. generally content themſelves to expreſs the different genders by different terminations, as *bonus equus*, a *good horſe*; *bona equa*, a *good mare*, &c. But in Engliſh we frequently go farther, and expreſs the difference of ſex by different words; as *boar*, *ſow*; *boy*, *girl*; *buck*, *doe*; *bull*, *cow*; *cock*, *hen*; *dog*, *bitch*, &c.

We have only about twenty-four feminines, diſtinguiſhed from the males, by the variation of the termination of the male into *eſs*; of which number are *abbot*, *abbeſs*; *count*, *counteſs*; *actor*, *actreſs*; *heir*, *heireſs*; *prince*, *princeſs*, &c. which is all that our language knows of any thing like genders.

The eaſtern languages, as well as the vulgar languages of the weſt, have three genders; the maſculine, feminine, and neuter. The Greek and Latin have likewiſe the neuter, common, and the doubtful gender; and beſides theſe, they have the epicene, or promiſcuous, which, under one ſingle gender, and termination, includes both the kinds.

The Engliſh language, with ſingular propriety, following nature alone, applies the diſtinction of maſculine and feminine only to the names of animals; all the reſt are neuter; except when by a poetical or rhetorical fiction things inanimate and qualities are exhibited as perſons, and conſequently become either male or female. And this gives the Engliſh an advantage above moſt other languages in the poetical and rhetorical ſtyle; for when nouns naturally neuter are converted into maſculine or feminine, the perſonification is more diſtinctly and forcibly marked. Lowth's Grammar, p. 44. ed. 1772.

Gender, in *Geometry*. Geometrical lines are diſtinguiſhed into genders, or genera, claſſes, or orders, according to the number of the dimenſions of the equation that expreſſes the relation between their ordinates, and the abſciſſas.

Gender, in *Botany*. See Genus.

Gender, in *Muſic*, &c. See Genera.

GENDIE, in *Geography*, a town of Egypt, on the left bank of the Nile; 4 miles N. of Abu-Girgé.

GENDRE, Gilbert-Charles le, in *Biography*, marquis de St. Aubin, was a counſellor in the parliament of Paris, and afterwards maſter of requeſts. He is known by two works of conſiderable reputation, theſe are; "Traité de l'Opinion, ou Mémoires pour ſervir á l'Hiſtoire de l'Eſprit Humain," ſix vols, 12mo., and "Antiquités de la Maiſon de France," 4to. The former conſiſts of a great variety of hiſtorical examples to elucidate the power of opinion in the ſciences, accompanied with reflections; the latter is a work of deep and curious reſearch concerning the origin of the regal dynaſties of France. Moreri.

Gendre, Louis le, was born of an obſcure family at Rouen in 1659. Through the favour and great kindneſs of M. de Harlai, then archbiſhop of Rouen, afterwards of Paris, he received an excellent education, and was in 1690 preſented with a canonry in the cathedral of Paris. His firſt eſſays as an author were two eulogies and a life of his patron, the ſtyle of which has been much approved by able critics.

In

In 1697 he publiſhed "Eſſays on the Reign of Louis le Grand," which he preſented, in perſon, to the monarch, and which were ſo well received by the public as to paſs through four editions in eighteen months. After this, he gave the world his "Hiſtory of France to the Death of Lous XIII.," in three vols. folio. This is eſteemed one of the moſt exact abridgments of French hiſtory, and is written with great ſimplicity. He died at Paris in 1733, at the age of 74. Beſides the works already mentioned, he publiſhed "A Treatiſe upon the Manners and Cuſtoms of the French at different Periods of their Monarchy:" and "A Life of the Cardinal Amboiſe, with a Parallel of the celebrated Cardinals who have governed States." At his death he left five hiſtories of his own life, each compoſed in a different ſtyle and manner, which he directed to be made public. He left alſo bequeſts for various ſingular foundations, ſome of which, after exciting diſputes relative to their fulfilment, were applied by authority to the inſtitution of prizes in the univerſity of Paris. Moreri.

GENDREY, in *Geography*, a town of France, in the department of the Jura, and chief place of a canton in the diſtrict of Dôle; 10 miles E. of Auxonne. The place contains 652, and the canton 4399 inhabitants, on a territory of 94 kiliometres, in 95 communes.

GENDRON, Claude-Deshais, in *Biography*, doctor of the faculty of Montpellier, phyſician in ordinary to Monſieur, the brother of Louis XIV., and afterwards to the duke of Orleans, when regent, was a native of Beauce. He exhibited in his early youth a conſiderable zeal and talent for natural hiſtory and medicine, and anxiouſly ſought the ſociety of men of ſcience and literature, with a view to profit by their inſtructions, and to learn the beſt mode of proſecuting his ſtudies. He ſoon became diſtinguiſhed by the ſucceſs of his practice in many caſes of chronic maladies of difficult cure. To the reputation, thus acquired, he added thoſe qualities of the mind and heart which endear a man to ſociety, at the ſame time that he deteſted all flattery and diſguiſe. At an advanced age he quitted his profeſſion, and retired with an ample income to Auteuil, near Paris, where he was viſited by all deſcriptions of the great, by miniſters, ambaſſadors, and men of ſcience, and various other perſons of both ſexes. He lived in this retirement with true Chriſtian philoſophy, and died on the 3d of September, 1750, at the age of 87, univerſally lamented. He wrote two treatiſes, the one entitled, "Recherches ſur la Nature et la Guériſon du Cancer," Paris 1601:—the other "Recherches ſur l'Origine le Développement, et la Reproduction des êtres Vivans."

A nephew of the preceding, Louis Florent Deſhais-Gendron, alſo a phyſician, was the author of two treatiſes on the diſeaſes of the eyes. Eloy. Dict. Hiſt.

GENDUR, in *Geography*, a town of Hindooſtan, in Dowlatabad; 24 miles N. of Naldowrouk.

GENEALOGICA Arbor. See Arbor.

GENEALOGY, a ſeries or ſucceſſion of anceſtors, or progenitors; or, a ſummary account of the relations and kindred of a perſon, or family, both in the direct and collateral lines.

The word is Greek, γενεαλογια, which is formed of γενος, *genus*, *proſapia*, *race*, and *lineage*; and λογος, *ſermo*, *diſcourſe*.

In divers chapters, and military orders, it is required, that the candidates produce their genealogy, to ſhew that they are noble by ſo many deſcents.

The genealogical degrees are uſually repreſented in circles, ranged over, under, and aſide of each other. The ancients had the like, which they called *ſtemmata*, from a Greek word, ſignifying *crown*, *garland*, or the like. See Consanguinity and Descent.

The Jews were very anxious for preſerving their genealogies entire and uninterrupted; and this care on their part affords an argument of conſiderable importance with reſpect to the accompliſhment of thoſe ancient prophecies that pertain to the Meſſiah. Accordingly, in their ſacred writings we find genealogies carried on for above 3500 years. It is obſerved (Ezra, ii. 62.) that ſuch prieſts as could not produce an exact genealogy of their families were not permitted to exerciſe their functions. Joſephus ſays that they had, in his nation, an uninterrupted ſucceſſion of prieſts for 2000 years; that the prieſts were particularly careful to preſerve their genealogies, not only in Judæa, but alſo in Babylonia and Egypt; and that, wherever they were, they never married below themſelves, and had exact genealogical tables prepared from thoſe authentic documents which were kept at Jeruſalem, and to which they had recourſe; and that, in all their wars, perſecutions, and calamities, they always were diligent in ſecuring thoſe documents, and in renewing them from time to time. Jerome ſays (ad Tit. iii.) that the Jews know ſo perfectly the genealogies, that they can repeat all the names from Abraham to Zerubbabel, as eaſily as their own. Nevertheleſs, ſince the war of the Romans againſt the Jews, about 30 years after the death of our Saviour, and ſince their entire diſperſion in the reign of Adrian, the Jews have loſt their ancient genealogies; and perhaps there is not even one of the ſacerdotal race who can produce authentic proofs of his genealogy. This circumſtance has been alleged by Chriſtian writers as a preſumptive proof of the actual advent of the Meſſiah, whoſe genealogy, correſponding to ancient predictions, the Jews are no longer able to trace, and conſequently of the truth of Chriſtianity. It is obſervable, that the genealogies ſet down by Ezra and Nehemiah vary in ſome particulars. Of this difference Dr. Prideaux (Conn. Pt. i. b. 4.) gives the following account: "For the true ſettling of theſe genealogies ſearch was made by Nehemiah for the old regiſters, and having found among them a regiſter of the genealogies of thoſe who came up at firſt from Babylon, with Zerubbabel and Joſhua, he ſettled this matter according to it, adding ſuch as afterwards came up, and expunging others whoſe families were extinguiſhed; and this has cauſed the difference between the accounts which we have of theſe genealogies in Ezra and Nehemiah. For in the ſecond chapter of Ezra we have the old regiſter, made by Zerubbabel; and in the ſeventh of Nehemiah, from the ſixth verſe to the end of the chapter, a copy of it, as ſettled by Nehemiah, with the alterations I have mentioned."

The genealogies of Chriſt, recorded by St. Matthew (ch. i.) and St. Luke (ch. iii.) in their reſpective goſpels, have occaſioned no little perplexity to biblical commentators and critics. The genealogy of Chriſt by Matthew is generally ſuppoſed to be that of Joſeph his reputed father; and that given by Luke to be that of his mother Mary, whom one of the Jewiſh rabbis calls the daughter of Heli. But according to Euſebius, who admits both the genealogies, as indeed they were generally received by the ancient fathers, and who cites a long paſſage from a letter of Julius Africanus, in which he endeavours to obviate the diſagreement between them, it was a tradition in the family of Joſeph, that he was properly the *legal ſon* of Heli, and that, as he died without children, his brother Jacob married his wife, and having a child by her, it was transferred to Heli. If the genealogy of Matthew be compared with the correſponding genealogies in the Old Teſtament, it will be found to differ from them in ſeveral reſpects; but it was probably ſuch a

genealogy

genealogy as was generally allowed to be of authority; and it ſufficiently proved the deſcent of Jeſus from David. The difference between the two genealogies, and the omiſſion of three perſons by Matthew (v. 8.), who were all deſcendants of David, do not, of themſelves, warrant our diſputing the authenticity of the two firſt chapters of Matthew's goſpel, as ſome have done. The omiſſion of Matthew might either be in the record copied by him, or it might have been occaſioned by ſome early tranſcriber. Allowing the former to be the caſe, the 17th verſe, which makes the generations between David and the Babyloniſh captivity to be no more than fourteen generations, muſt, as biſhop Pearce obſerves, be an interpolation. We refer, without farther enlarging, to the numerous commentators and critics, who, in their harmonies and comments, have written on the ſubject.

Genealogical tables are of great uſe for exhibiting at one view, and in a compendious manner, the deſcent of families.

The moſt natural order of theſe tables ſeems to be to place the common ſtock at the head of the table, and the ſeveral deſcents, or ſucceeding generations, each in a lower line appropriated to it; and not to make the order of generations to proceed from the left hand to the right, as is done by ſome. But every diſtinct generation ſhould by all means be placed in a line or ſpace appropriated to itſelf; otherwiſe our ideas will be greatly confuſed. The order of birth in the ſame generation may eaſily be obſerved (as is done in ſome of our beſt tables) by placing the firſt-born to the left hand in the table, and the reſt, according to the order of birth, to the right.

There is a variety of other relations, beſides mere natural deſcent, of which it is very uſeful to have a clear idea, as the connection by marriage, by adoption among the Romans, &c. by which different families are intermixed. And it is poſſible, by different kinds of lines, joining the names ſo connected, how remote ſoever, in the table of generation, to expreſs all thoſe relations without the uſe of words. But as the attempt to expreſs them all by characters disfigures the table with a great variety of lines, many of them of conſiderable length, and extending themſelves in every direction, it ſeems moſt convenient to expreſs *natural deſcent* only by characters, and to ſubjoin to each name an account, in words, of all its other connections, referring at moſt from one to another, by *marks* contrived for that purpoſe. This method Rapin has taken in the excellent genealogical tables in his "Hiſtory of England."

Some valuable tables of genealogy may be ſeen at the end of "Petavius's Chronology;" but the largeſt and moſt complete body of genealogies is that publiſhed by Anderſon; which, in one large volume folio, contains all the genealogies he could collect from the whole body of hiſtory, ancient and modern. Prieſtley's Lectures on Hiſtory, ſect. xvii.

GENEBRARD, Gilbert, in *Biography*, was born at Riom, in Auvergne, about the year 1537. At a very early age he entered into the Benedictine order in the dioceſe of Clermont, and went to purſue his ſtudies at Paris, where he learned Greek under Turnebius, philoſophy under Carpentier, and theology under Claude de Saintes. He ſoon became diſtinguiſhed for his great learning, and in 1563 was admitted to the degree of doctor of divinity by the college of Navarre, and was afterwards appointed regius-profeſſor of the Hebrew language. He was nominated to ſeveral important offices in the church, but being diſappointed in his expectations of a biſhopric through the intrigues at court, he joined the party of the League, of which he became a zealous advocate. The numerous writings which he publiſhed againſt thoſe who ſupported the meaſures of the court and the reformed religion were uncommonly bitter and furious. They had however ſufficient influence to obtain for him the archbiſhopric of Aix, to which ſee he was conſecrated in the year 1593. Here he continued to ſhew his hoſtility to the court, and went ſo far as to declaim againſt the king, in his ſermons, even when his own cauſe was hopeleſs. The League being broken up, and Henry IV. generally acknowleged throughout the kingdom, Genebrard thought it adviſable to retire to Avignon, where he publiſhed a treatiſe "De Sacrarum Electionum Jure, ad Eccleſiæ Romanæ Reintegrationem," in which he diſplayed ſo much violence againſt kings and princes, that he was proſecuted and ſentenced to perpetual baniſhment. He was, however, permitted to retire to his priory at Semur, but his book was ordered to be burnt by the hands of the common executioner. He died in 1597, when little more than ſixty years of age. His works are very numerous, and many ſhew that he poſſeſſed very conſiderable erudition, and that he was as induſtrious in the inveſtigation of the ſubjects on which he wrote as he was learned. His principal pieces were "A ſacred Chronology," more exact than any that had before appeared. Notes and Commentaries on various books of the Old Teſtament. "An Introduction to the reading of Hebrew and other Eaſtern Languages without Points." "A Treatiſe againſt the Eternity of the World." "An Edition of Origen's Works," and a tranſlation of the works of Joſephus into the French language. Moreri.

GENENNE, El, in *Geography*, a town of Egypt; 60 miles S. of Girgé.

GENERA, in *Ancient Greek Muſic*, implied, according to Euclid, the different diviſions and diſpoſitions of the tetrachord or fourth, as to the intervals of the four ſounds of which it is compoſed.

Plutarch (de Muſica) ſays, that it is not ſufficient for a muſician to know what kind of muſic ſhould be ſet to any particular poem; he ſhould likewiſe know how to write it down in all the genera, that is to ſay, in the diatonic or natural ſcale, conſiſting of tones and ſemitones, as at preſent; in the chromatic, in which the ſcale was divided into ſemitones and minor thirds; and in the enharmonic genus, moving by quarter tones, and major thirds.

In modern muſic the genera are but two; diatonic and chromatic. Theſe conſiſt in the manner of arranging the tones and ſemitones of which melody is compoſed.

When no more than two ſemitones occur in the courſe of an octave, the melody may properly be ſtyled genuine diatonic.

Indeed the chromatic in uſe at preſent can hardly be compared with that of the ancients; for with them every accidental flat or ſharp which led to a new mode or key, would have been called a change of genus. With us, however, a mere change of modulation, though it occaſions a change of key, is not a change of genus; for while the ſounds made uſe of in harmony and melody can be referred to any one key, the diatonic genus is ſuppoſed to be preſerved: it is only a regular ſucceſſion of two or more ſemitones, aſcending or deſcending, that conſtitutes modern chromatic.

In ancient muſic, not only the tone was divided into two, as with us, but the ſemitone by a dieſis or quarter-tone. Theſe three kinds of interval, the tone, ſemitone, and dieſis, conſtituted the difference of the three genera.

The fourth being the conſtant boundary of ſounds in the muſic of the ancients, as the octave is in that of the moderns, its extremes, or loweſt and higheſt ſounds, were *ſtantes*, *immobiles*, or fixed. As the octave in modern muſic admits of no change, but is tuned as perfect as poſſible, ſo the

the fourths in ancient muſic were never allowed to deviate from perfection.

The different genera were therefore characterized by the changes made in the two middle ſounds of the tetrachords, that were ſtiled *mobiles*, mutable.

In the diatonic genus, the melody proceeded by a ſemitone, and two tones, as B C D E  ; and it was from the ſucceſſion of two tones, that this genus acquired the name of *Diatonic*. As the term is derived from δια, *by*, and τονος, *tone*; that is, paſſing from one tone to another; which, in the Greek muſic, was never done but in the diatonic genus.

The *Chromatic* proceeded by two ſucceſſive ſemitones, and a hemiditone, or minor third, as B C C ✕ E . This modulation holding the middle place between the diatonic and enharmonic, has been ſuppoſed by Martianus Capella and Bryennius, to derive its name from χρωμα, *colour*; for as the gradations between black and white are called colours; ſo this genus, being placed between the diatonic and enharmonic, is called *chromatic*. M. Rouſſeau tells us, in his Dictionary, that this genus uſed to be written in coloured notes, but without giving any authority in ſupport of this opinion.

The *Enharmonic* tetrachord proceeded by two quarter tones, and a major third, B B × C E  . This genus is often called by Ariſtoxenus, and others, ſimply ἁρμονια, *harmonia*, that is, well arranged and ordered.

Ariſtoxenus tells us, that the diviſions and bounds of the genera were not accurately fixed till his time; and Ariſtides Quintilianus ſpeaks of ſeveral genera, or ſpecies of intervals, which were of the higheſt antiquity; yet ſo wild and irregular, that after the art of muſic was brought to a greater degree of perfection, and the laws of the three principal genera were ſettled, they had been totally diſuſed by the beſt muſicians. The ſame author aſſerts, that it is of theſe barbarous diviſions of the ſcale, or old harmonies, as they were called, and not the common modes of the ſame names, that Plato ſpeaks in his Republic, where he admits ſome of them, and rejects others.

The ancients attributed peculiar effects to each genus, and ſpeak of many characteriſtic diſtinctions of genera, which now appear to be wholly fanciful and imaginary. Theſe, if they ever had exiſtence, were, perhaps, deſtroyed by modern harmony. Ariſtides Quintilianus, p. 111, tells us, that

The diatonic is manly and auſtere;

The chromatic ſweet and pathetic; and

The enharmonic animating and mild.

Vitruvius, ſpeaking of the enharmonic, ſays, that it is in a particular manner grave and majeſtic. "Cantus ejus maximè gravem, et egregiam habet auctoritatem."

Perhaps the idea of a major-key, which the enharmonic ditone muſt impreſs upon the ear, may have contributed to the notion of muſic in that genus being animating; but how it could be at the ſame time grave and ſoothing, animating and mild, is not eaſy to conceive. This genus was never known to the Romans, having been loſt before they attempted the polite arts.

And Plutarch, in his firſt Eſſay againſt Colotes, the Epicurean, aſks, "Why does the chromatic genus melt and diſſolve, and the enharmonic brace the nerves, and compoſe the mind, after being diſturbed?"

Ariſtides Quintilianus, in another place, (p. 19. Edit. Meibom.) ſays of the genera, that the diatonic is the moſt natural, becauſe all who have ears, though uninſtructed in muſic, are capable of ſinging it.

The chromatic is more artificial, for it can be ſung only by ſuch as are adepts in muſic.

The enharmonic is the moſt refined and difficult of all, and has been received and practiſed only by the greateſt artiſts. See ENHARMONIC and MUSIC *of the Ancients*.

GENERAL, ſomething that comprehends all, or extends to a whole genus, or kind.

All the ſciences have ſome general principles, or axioms.

General councils are particularly called œcumenical.

GENERAL *Aſſembly*, *aſſizes*, *averment*, *council*, *demurrer*, *diet*, *fee-tail*, *jund*, *geography*, *gravity*, *imparlance*, *iſſue*, *legacy*, *nature*, *occupancy*. See the ſeveral ſubſtantives.

GENERAL *Officers*, in an *Army*, are thoſe who do not only command over a ſingle company, or regiment, but whoſe office and authority extend over a body of ſeveral regiments of horſe and foot.

Such are brigadier-generals, lieutenant-generals, major-generals, generals of the horſe, and of the foot. All officers above the rank of lieutenant-colonel are called general officers. See GENERAL, below. See alſo PAYMASTER-*general*, COMMISSARY-*general*, MUSTERMASTER-*general*, &c. and PAY.

We have alſo officers in law, in the revenues, &c. diſtinguiſhed by the appellation of general: as attorney-general, ſolicitor-general, &c. receiver-general, comptroller-general, &c.

GENERAL *pauſe*, *qualities*, *-ſeſſions*, *ſtatutes*, *tail*. See the ſubſtantives.

GENERAL *terms* or *words*, are ſuch as expreſs or denote general ideas.

Ideas become general, by ſeparating from them the circumſtances of time, place, or any other ideas that may determine them to this or that particular exiſtence.

By this way of abſtraction they become capable of repreſenting more individuals than one; each of which having a conformity to that abſtract idea, is of that ſort.

All things, Mr. Locke obſerves, that exiſt, being particulars, it might be expected that words ſhould be ſo too in their ſignification; but we find it quite contrary; for moſt of the words that make all languages, are general terms.

This is the effect of reaſon and neceſſity: for, 1. It is impoſſible that every particular thing ſhould have a diſtinct peculiar name; becauſe it is impoſſible to have diſtinct ideas of every particular thing, to retain its name with its peculiar appropriation to that idea. 2. It would be uſeleſs, unleſs all could be ſuppoſed to have the ſame ideas in their minds: for names applied to particular things, whereof one alone has the ideas in his mind, could not be ſignificant, or intelligible to another, who is not acquainted with all thoſe particular things which had fallen under his notice. 3. It would be of no great uſe for the improvement of knowledge; which, though founded in particular things, enlarges itſelf by general views, to which things reduced into ſorts under general names, are properly ſubſervient.

In things where we have occaſion to conſider and diſcourſe of individuals and particulars, we uſe proper names: as in perſons, countries, cities, rivers, mountains, &c.

The firſt ideas children get are only particular; as thoſe of the nurſe, or mother; and the names they give them are confined to theſe individuals; afterwards, obſerving that there are a great many other things in the world that reſemble

ſemble them in ſhape, and other qualities, they frame an idea which they find thoſe many particulars do partake in: to that they give, with others the name, *man*, for example. In this they make nothing new, but only leave out of the complex idea they had of Peter, James, Mary, &c. that which is peculiar to each, and retain only what is common to all. And thus they come to have a general name, and a general idea.

By the ſame method they advance to more general names and notions; for obſerving ſeveral things that differ from their idea of man, and which cannot, therefore, be comprehended under that name, to agree with man in ſome certain qualities; by retaining only thoſe qualities, and uniting them into one idea, they have another more general idea; to which, giving a name, they make a term of a more comprehenſive extenſion.

Thus, by leaving out the ſhape, and ſome other properties ſignified by the name, man; and retaining only body with life, ſenſe, and ſpontaneous motion, we form the idea ſignified by the name *animal*. After the ſame manner, the mind proceeds to body, ſubſtance, and at laſt to being, thing, and ſuch univerſal terms, which ſtand for any ideas whatſoever.

Hence, we ſee the whole myſtery of genus and ſpecies is nothing but abſtract ideas, more or leſs comprehenſive, with names annexed to them: this ſhews us the reaſon why, in defining words, we make uſe of the genus; namely, to ſave the labour of enumerating the ſeveral ſimple ideas, which the next general term ſtands for.

From what has been ſaid, it is plain, that general and univerſal belong not to the real exiſtence of things, but are the inventions of the underſtanding, made by it for its own uſe, and concern only ſigns, either words or ideas. General words do not barely ſignify one particular thing; for then they would not be general terms, but proper names: neither do they ſignify a plurality; for then man and men would ſignify the ſame thing; but what they ſignify is a ſort of things; and this they do, by being made ſigns of abſtract ideas in the mind; to which ideas, as things exiſting are found to agree, ſo they come to be ranked under that name, or to be of that ſort.

The eſſences then of the ſorts, or ſpecies of things, are nothing but theſe abſtract ideas.

It is not denied here, that nature makes things alike, and ſo lays the foundation of this ſorting and claſſing; but the ſorts or ſpecies themſelves are the workmanſhip of human underſtanding; ſo that every diſtinct abſtract idea is a diſtinct eſſence; and the names that ſtand for ſuch diſtinct ideas, are the names of things eſſentially different. Thus oval, circle, rain, and ſnow, are eſſentially different. See this further illuſtrated under ABSTRACTION, ESSENCE, IDEA, and SUBSTANCE.

GENERAL *Verdict, Warrant, Wind.* See the Subſtantives.

GENERAL *of an Army*, is the chief commanding officer; whoſe buſineſs is to regulate the march and encampment of the army; to chooſe the moſt advantageous ground in the day of battle; to diſpoſe the army; to poſt the artillery; and to ſend his orders, wherever there is occaſion, by his aids-de-camp. At a ſiege, he is to cauſe the place to be inveſted; to regulate the approaches and attacks; to viſit the works, and to ſend out detachments for ſecuring the convoy; and for foraging. See GENERALISSSIMO.

The natural qualities of a general ſhould be a martial genius, a ſolid judgment, a healthy robuſt conſtitution, intrepidity and ſelf-poſſeſſion on critical occaſions, goodneſs of heart, and liberality: he ſhould alſo be of a mean age, neither too young, becauſe he would want prudence and experience, nor too old, becauſe he would want vivacity and activity. He ſhould be ſteady and uniform in his conduct, affable in his diſpoſition, and yet inflexible in maintaining the diſcipline of his army. His acquired qualities ſhould be ſecrecy, juſtice, ſobriety, temperance, knowledge of the art of war, both from theory and practice, the art of commanding and of ſpeaking with preciſion, great attention in preſerving the lives and ſupplying the wants of the ſoldiers, and a conſtant ſtudy of the characters of the officers of his army, ſo that he may be capable of employing them according to their reſpective talents. His conduct appears in eſtabliſhing his magazines in the moſt convenient places; in examining the country, that he may not engage his troops too far, while he is ignorant of the means of bringing them off; in procuring ſubſiſtence for them; and in ſelecting the moſt advantageous poſts for fighting, retreating, or ſhunning a battle. His experience inſpires his army with confidence; his quality, by creating reſpect, augments his authority; his liberality enables him to procure intelligence of the ſtrength and deſigns of the enemy, and thus to take the moſt ſucceſsful meaſures. In a word, a general ought to be fond of glory, to have an averſion to flattery, to render himſelf beloved, and to keep a ſtrict diſcipline and ſubordination.

In the day of battle, the ſtation of a general is with the reſerve, where he remains ſo ſituated, that he can ſee every thing which is going forward; and by means of his own obſervations, or the communications of his aids-de-camp, he is enabled to ſend reinforcements, as the exigences of the conflict may require.

GENERAL, *Adjutant*, is an officer who attends the general, aſſiſts in council, and carries the general's orders to the army. He diſtributes the daily orders to the majors of brigade. He is likewiſe charged with the general detail of the duty of the army. The majors of brigade ſend every morning to the adjutant-general an exact return, by battalion and company, of the men of their brigade. In a day of battle, the adjutant-general ſees the infantry drawn up, after which he places himſelf by the general, to receive any orders which may regard the corps of which he has the detail. In a ſiege, he orders the number of workmen required, and ſigns the warrants of their payment. He receives the guards of the trenches at their rendezvous, and examines their condition; he gives and ſigns all orders for parties; he has an orderly ſerjeant from each brigade of infantry in the line, to carry ſuch orders as he may have occaſion to ſend from the general. See ADJUTANT.

GENERAL *of the Artillery*. See ARTILLERY.

GENERAL, *Brigadier*, is next in rank, in the Britiſh ſervice, to that of major-general, being ſuperior to all colonels, and having a ſeparate command. Brigadier-generals are not entitled to aids-de-camp; but they have each one brigade-major. See BRIGADIER.

GENERAL, *Brigade-Major*. As England and Scotland have been divided into different diſtricts, each diſtrict being under the command of a general officer, it has been found neceſſary, for the diſpatch of buſineſs, to eſtabliſh an office, which ſhall be ſolely confined to brigade duties.

The firſt brigade-major-general was appointed in 1797. Since this period all orders relative to corps of officers, which are tranſmitted from the commander-in-chief to the generals of diſtricts, paſs through this channel of intermediate communication.

By the laſt general regulations, it is particularly directed, that all general officers commanding brigades, ſhall very

minutely inſpect the internal economy and diſcipline of the ſeveral regiments under their order.

They are frequently to viſit the hoſpitals and guards. On arriving in camp they are never to leave their brigades till the tents are pitched, and the guards poſted; they muſt always encamp with their brigades, unleſs quarters can be procured for them immediately in the vicinity of their camp. General officers muſt not at any time change the quarters aſſigned them, without leave from head-quarters.

All general officers ſhould make themſelves acquainted, as ſoon as poſſible, with the ſituation of the country near the camp, with the roads, paſſes, bridges, &c. leading to it; and likewiſe with the out-poſts, that in caſe they ſhould be ordered ſuddenly to ſuſtain, or defend any poſt, they may be able to march without waiting for guides, and be competent, from a topographical knowledge of the country, to form the beſt diſpoſition for the ſervice. They ſhould inſtruct their aids-de-camp in theſe particulars, and always require their attendance when they viſit the out-poſts.

All general officers, and others in conſiderable command, muſt make themſelves thoroughly acquainted with the nature of the country, the quality of the roads, every circuitous acceſs through vallies or openings, the relative height of the neighbouring hills, and the courſe of rivers, which are to be found within the ſpace entruſted to their care. Theſe important objects may be attained by maps, by acquired local information, and by unremitting activity and obſervation. And if it ſhould ever be the fate of a country, interſected as Great Britain is, to act upon the defenſive, a full and accurate poſſeſſion of all its faſtneſſes, &c. muſt give each general officer a decided advantage over the commanding officer of an enemy, who cannot have examined the ground upon which he may be reduced to fight, and muſt be embarraſſed in every forward movement that he makes. Although guides may ſerve, and ought always to be uſed in the common operations of marches, there are occaſions where the eye and intelligence of the principal officers muſt determine the movements of troops, and enable them to ſeize and improve every advantage that occurs as the enemy approaches.

General officers on ſervice abroad, or commanding diſtricts at home, may appoint their own aids-de-camp and brigade-majors. The latter, however, are to be conſidered as officers attached to their ſeveral brigades, not perſonally to the officers commanding them. The former are their habitual attendants and domeſtic inmates. In the ſelection of aids-de-camp and brigade-majors, too much attention cannot be given to their requiſite qualifications; and that general would not only commit an act of injuſtice againſt the intereſts of his country, but deſerve the ſevereſt cenſure and diſpleaſure of his ſovereign, who, through motives of private convenience, family connection, or convivial recommendation, could ſo far forget his duty, as to prefer an unexperienced ſtripling, to a character marked by a knowledge of the profeſſion, a zeal for the ſervice, and an irreproachable conduct.

GENERAL, *Colonel*, an honorary title, or military rank, which is conferred in foreign ſervices. Thus, the prince of peace in Spain is colonel-general of the Swiſs-guards.

GENERAL *of a Diſtrict*, a general officer, who has the charge and ſuperintendance of a certain extent of country, in which troops are encamped, quartered, or cantoned. He is entitled to have three aids-de-camp, and one brigade-major. He receives reports, &c. from the major-general, reſpecting the troops in his diſtrict; reviews and inſpects them, and likewiſe orders field-days of the whole, brigaded, or by ſeparate corps, when and in what part he pleaſes, making the neceſſary reports to the war-office, commander-in-chief, &c.

GENERAL *of Foot*, is an officer under the chief general, who has an abſolute command of the foot of the army.

GENERAL *of Horſe*, is an officer next under the chief general, who has an abſolute command of the horſe of an army, above the lieutenant-generals.

GENERAL, *Lieutenant*, is the firſt military dignity after that of a general. One part of their function is to aſſiſt the general with counſel; and, therefore, this officer ought, if poſſible, to poſſeſs the ſame qualities with the general himſelf; and this is the more neceſſary, as he often commands armies in chief, or ſucceeds to the command on the death of the general.

Lieuteant-generals have been of late multiplied in Europe, in proportion as the armies have become more numerous. They ſerve either in the field, or in ſieges, according to the dates of their commiſſions. In battle the eldeſt commands the right wing of the army, the ſecond the left wing, the third the centre, the fourth the right wing of the ſecond line, the fifth the left wing, the ſixth the centre, and ſo on. In ſieges the lieutenant-generals always command the right of the principal attack, and order what they judge proper for the advancement of the ſiege, during the 24 hours they are in the trenches, except the attacks, which they are not to make, without an order from the general-in-chief. Lieutenant-generals are entitled to two aids-de-camp.

GENERAL *of Artillery, Lieutenant*, is ſuppoſed to be an able mathematician and engineer, to know all the powers of artillery, to underſtand the attack and defence of fortified places, in all their different branches, and how to diſpoſe of the artillery in the day of battle to the greateſt advantage; to conduct its march and retreat; and alſo to be well acquainted with the numerous apparatus belonging to the train, laboratory, &c.

GENERAL, *Major*, the next officer to the lieutenant-general; whoſe office it is to receive orders from the general, or, in caſe of his abſence, from the lieutenant-general of the day; which orders he is to diſtribute to the brigade-majors, with whom he is to regulate the guards, convoys, detachments, &c. On him the whole fatigue and detail of duty of the army reſt. It is the major-general of the day who is charged with the encampment of the army, who places himſelf at the head of it, when it marches, who marks out the ground of the camp to the quarter-maſter-general, and who places the new guards for the ſafety of the camp. On the day when the army is to march, he dictates to the field-officers the order of the march, which he has received from the general, and on other days he gives them the parole. In a fixed camp he is charged with the foraging, with reconnoitring the ground for it, poſting the eſcorts, &c. In ſieges, when two ſeparate attacks are made, the ſecond belongs to him; but if there be only one, he takes either from the right or left of the attack, that which has not been choſen by the lieutenant-general. When the army is under arms, he aſſiſts the lieutenant-general, and executes his orders. If the army marches to an engagement, his poſt is at the head of the guards of the army, until they are near enough to the enemy, to enjoin their different corps; after which he returns to his own proper poſt; for the major-generals are diſpoſed in the order of battle as the lieutenant-generals are, to whom, however, they are ſubordinate, for the command of their diviſions. The major-general has one aid-de-camp and one brigade-major.

GENERAL is alſo uſed, in a monaſtic ſenſe, for the chief of an order; or of all the houſes or congregations eſtabliſhed under the ſame rule.

Thus we ſay the general of the Ciſtercians, the Franciſcans, &c.

F. Thomaſſin derives the origin of generals of orders from the privileges granted by the ancient patriarchs to the monaſteries ſituate in their capital cities. By ſuch means they were exempted from the juriſdiction of the biſhop, and immediately ſubjected to that of the patriarch alone.

GENERAL *of the Jeſuits*. See JESUITS, and ADJUTANT.

GENERAL is alſo uſed, in the *Military Art*, for a particular march, or beat of drum; being the firſt which gives notice, commonly in the morning early, for the infantry to be in readineſs to march. See DRUM.

GENERALISATION, in the *Philoſophy of the Human Mind*, denotes, according to profeſſor Stewart, nothing more than the capacity of employing general terms; though ſome philoſophers have ſuppoſed that it is a faculty of the mind diſtinct from abſtraction, and neceſſary to account for the formation of genera and ſpecies; and they have endeavoured to ſhew, that although generalization without abſtraction is impoſſible; yet, that you might have been ſo formed, as to be able to abſtract, without being capable of generalizing. Stewart's Elements, &c. p. 159, &c. See ABSTRACTION.

GENERALISSIMO, called alſo *Captain-General*, and ſimply *General*, is an officer who commands all the military powers of a nation; who gives orders to all the other general officers; and receives no orders himſelf but from the king. He holds this important truſt under various titles, as captain-general in England and Spain, feldt-mareſchal in Germany, or mareſchal in France. In the Britiſh ſervice the king is conſtitutionally, and in his own proper right, captain-general. He has ten aids-de-camps; every one of whom enjoys the brevet rank of full colonel in the army. Next to his majeſty is the commander-in-chief, whom he ſometimes honours with the title of captain-general.

Monſ. Balſac obſerves that the cardinal de Richelieu firſt coined the word, generaliſſimo, of his own abſolute authority, upon his going to command the French army in Italy.

GENERATE, in *Muſic*, is uſed to ſignify the operation of that mechanical power in nature, which every ſound has in producing one or more different ſounds. Thus, any given ſound, however ſimple, produces, together with itſelf, its octave, and two other ſounds, extremely ſharp, *viz.* its twelfth above, *i. e.* the octave of its fifth, and the other the ſeventeenth above, or the double octave of its third major. Whether we ſuppoſe this procreation of ſounds to reſult from an aptitude in the texture and magnitude of certain particles in the air, for conveying to one's ears vibrations that bear thoſe proportions to one another, as being determined at once by the partial and total oſcillations of any muſical ſtring; or from whatever economy of nature we chuſe to trace it; the power of one ſound thus to produce another, when in action, is ſaid to "generate." The ſame word is applied by Tartini and his followers to any two ſounds, which, ſimultaneouſly heard, produce a third. See GENERATOR.

GENERATED, or GENITED, is uſed by ſome mathematical writers, for whatever is produced, either in arithmetic by the multiplication, diviſion, or extraction of roots; or in geometry, by the invention of the contents, areas, and ſides; or of extreme and mean proportionals, without arithmetical addition and ſubtraction. Thus, 20 is the product generated of 4 and 5; *a b* that of *a* and *b*; 4, 8, 16, &c. the powers generated from the root 2, and a^2, a^3, a^4, &c. thoſe from the root *a*. Thus alſo, a circle is generated by the revolution of a line about one of its extremities, a right cone by the rotation of a right-angled triangle about its perpendicular, a cylinder by the rotation of a rectangle about one of its ſides, or by the motion of a circle in the direction of a right line, whilſt it always keeps parallel to itſelf.

GENERATING LINE, or *Figure*, in *Geometry*, is that which, by its motion of revolution, produces any other figure, plane, or ſolid. Thus, a line, according to Euclid, generates a circle, a right-angled triangle, a right cone, &c. (ſee the preceding article); and thus alſo Archimedes ſuppoſes his ſpirals to be generated by the motions of generating points and lines; and the figure thus generated is called the "generant." In geometry it is a general theorem, that the meaſure of any generant, or figure produced by any kind of motion of any other figure, or generating quantity, is equal to the product of this generating quantity drawn into the length of the path deſcribed by its centre of gravity, whatever the kind of motion may be, whether rotatory, or direct, &c. (See CENTRO-BARYC *Method.*) In the modern analyſis, or fluxions, all ſorts of quantities are conſidered as generated by ſome ſuch motion, and the quantity hereby generated is called a fluent. See FLUENT and FLUXION. See GENESIS.

GENERATION, in *Mathematics*, denotes the formation or production of any geometrical figure, or other quantities, as any of thoſe mentioned in the preceding articles; and the term is alſo applied to equations, &c.

GENERATION, in *Phyſics*, denotes the act of procreating, or producing a thing which before was not: or, the total change or converſion of a body into a new one, which retains no ſenſible part, or mark of its former ſtate.

Thus, fire is ſaid to be generated, when we perceive it to be where before was only wood, or other fuel: or when the wood is ſo changed as to retain no ſenſible character of wood: thus, alſo, a chick is ſaid to be generated, when we perceive the chick, where before was only an egg; or when the egg is changed into the form of a chick.

In generation, there is not properly any production of new parts, but only a new modification or manner of exiſtence of the old ones; by this, generation is diſtinguiſhed from *creation*.

It is diſtinguiſhed from *alteration*, in that the ſubject, in this latter, remains apparently the ſame; and only the accidents or affections are changed; as when the ſame body is to-day well, and to-morrow ſick; or that braſs, which before was round, is now ſquare.

Laſtly, generation ſtands oppoſed to *corruption*, which is the utter extinction of a former thing: as when that which before was wood, or an egg, is no longer the one or the other, whence it appears, that the generation of one thing is the corruption of another.

The Peripatetics explain generation by a change or paſſage from a privation, or want of a ſubſtantial form, to the having of ſuch a form. The moderns allow of no other change in generation, than what is local: according to them it is only a tranſpoſition, or new arrangement of parts; and thus the ſame matter ſhall ſucceſſively undergo an infinity of generations.

A grain of wheat, *e. gr.* is committed to the ground: this, imbibing the humidity of the ſoil, becomes turgid, and dilates to ſuch a degree, that it becomes a plant; and, by a continual acceſſion of matter, ripens by degrees into an ear; and at length into new ſeed. This ſeed, ground in the mill, appears in form of flour; which, mixed up with water, makes a paſte; whereof, with the addition of yeaſt, fire, &c. bread is generated; and this bread, broken with the teeth, digeſted in the ſtomach, and conveyed through the canals of the body, becomes fleſh.

Now, in all this ſeries of generation, the only thing effected is a local motion of the parts of the matter, and their ſettling again in a different order; ſo that, in reality, wherever there is new arrangement or compoſition of elements, there is a new generation; and, therefore, generation is finally reducible to motion.
